CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 14
JULY 15, 1977

W77-06601 -- W77-07100

Secretary of the U.S. Department of the Interior has de-
ned that the publication of this periodical is necessary in the
action of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

LIBRARY U. OF I. URBANA-LIBRARY

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

MATHEMATICAL MODELS IN HYDROLOGY.
United Nations Educational, Scientific and Cultural Organization, Paris (France).
Proceedings of the Warsaw Symposium, Poland, July 1971, Volumes 1, 2, and 3. IAHS/Unesco, Paris, France, 1974. Vol 1--439 p, Vol 2--p 443-1110, Vol 3--p 1111-1351.

Descriptors: *Hydrology, *Mathematical models, *Research, *Methodology, *Optimization, *Water policy, *Operations research, Data collections, Structural analysis, Stochastic processes, Planning, Management, Water storage, Parametric hydrology, River systems, Lakes, Estuaries, Hydrodynamics, Constraints, Economics, Regional development, Systems analysis, Equations, *Water resources development, Reservoirs operation, *Simulation analysis.
Identifiers: Hydrologic sequences, Multi-dimensional processes, Conceptual catchment models, Objective functions, Cost minimization, Benefit maximization.

Volumes 1, 2, and 3 of this symposium contain some 140 articles, studies, reports, and discussions covering the comprehensive field of mathematical modeling in hydrology. This Proceedings belongs the Studies and Reports in Hydrology series which is aimed at recording collected data and the main results of hydrological studies undertaken within the framework of the International Hydrological Decade (1965-74), launched by the General Conference of Unesco. The Proceedings contains the compilation of data, discussions of hydrological research techniques and findings, and guidance material for future scientific investigations. Each volume is divided into sections, based on the Conference sessions, dealing with a particular hydrological problem. Found in Volume 1 are: structural analyses of hydrological sequences; multi-dimensional processes in hydrology; and stochastic analyses of water storage problems. Volume 2 presents: the fitting of conceptual catchment models; distributed parameter catchment models and input fields; hydrodynamic models of river systems, lakes and estuaries; objective functions and constraints in water resources systems; optimal operation of water resources systems; and planning of systems for regional development in water resources. Volume 3 is comprised of a general report and a discussion on each of the 18 Conference sessions. It is hoped that these volumes will furnish material of both practical and theoretical interest to hydrologists and governments concerned with problems of water in all countries. ON THE APPLICATION OF OPTIMIZATION TECHNIQUES TO CONCEPTUAL CATCHMENT MODELS,
Technische Universitaet, Dresden (East Germany).
U. Grunewald, and S. Dyck.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 493-503. 7 fig, 1 tab, 23 ref.

Descriptors: *Parametric hydrology, *Optimization, *Reservoirs, *Channels, *Behavior, Storage, Statistical models, Mathematical models, Equations, Methodology, Systems analysis, Watershed management.
Identifiers: *Experimental system identification, Second-order regression polynomial, Ridge line analysis, Conceptual models.

The application of the parametric method of experimental system identification is described. In particular, first results of applying two optimization methods to three conceptual models of catchment behavior are discussed. Only linear time-invariant systems are considered. With model (1), the known conceptual model of identical linear reservoirs in series is termed with the constant storage coefficient k. Model (2) results from the conceptual model of a series of alternating linear channels and linear reservoirs. Model (3) consists of a linear channel and two linear reservoirs of different storage coefficients, k1 and k2, in series. The optimization methods used are: the method of the linearization of the normal-equations (method of LNE'); and statistical optimization ('ridge-line analysis'). Results show that neglect of the variation of the translation time over the catchment (model (1)) does not yield a conceptual model of wide applicability. In the special cases of 'flat' impulse response functions, a good fit is obtained for model (1), whereas models (2) and (3) seem to be the models of widest applicability. (See also W77-06708) (Bell-Cornell)

USE OF A PARAMETRIC MODEL AS A TOOL FOR HYDROMETRIC NETWORK PLANNING,
Waterloo Univ., (Ontario). Dept. of Civil Engineering.
S. I. Solomon, A. S. Qureshi, and U. Korngold.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 511-526. 6 fig, 1 tab, 9 ref.

Descriptors: *Networks, *Parametric hydrology, *Planning, Monthly, Flow, Regions, Hydrologic data, Methodology, Conjunctive use, Gaging stations, Meteorological data, Terrain analysis, Precipitation, Temperature, Evaluation, Constraints, Costs, Systems analysis, Mathematical models.
Identifiers: *Hydrometric networks, *Regional planning, *Data transfer, Network expansion, Budget allocation, Physiographical characteristics.

This paper discusses the potential of a parametric model, designed to generate monthly flows, as a tool for planning a regional hydrometric network. Development of the model and its use as a data transfer technique are described. Possible advantages over other techniques are emphasized. The methodology for applying the technique to hydrometric network design is outlined. (See also W77-06708) (Bell-Cornell)

A MODEL FOR THE WATER REGIME OF A DECIDUOUS FOREST WITH SPECIAL CONSIDERATION OF THE FUNCTIONAL INTERRELATIONSHIPS AMONG METEOROLOGICAL FACTORS, SOIL WATER CONTENT AND EVAPOTRANSPIRATION, (IN GERMAN),
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
H. Item.
Eidg Anst Forstl Versuchwes Mitt 50(3), p 137-332, 1974.

Descriptors: *Mathematical models, *Water balance, *Deciduous forests, *Forests, Soil water, Soil moisture, Moisture content, Evapotranspiration.
Identifiers: Meterological factors.

A mathematical model describing the water regime of a forest depending on meterological conditions is proposed. In an application of the model, it should be possible to calculate the soil water content at any time during the vegetation period using that in spring and meteorological records. If soil moisture data are generated in this way, it should be possible to study the influence of drought on the mass increment of trees.--Copyright 1976, Biological Abstracts, Inc.

COASTAL METEOROLOGICAL NETWORKS TO DETERMINE EFFECTS OF NUCLEAR PLANT COOLING SYSTEMS,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Science.
E. Ryznar, D. G. Baker, and H. Moses.
Bulletin of the American Meteorological Society, Vol. 57, No. 12, p 1441-1446, December 1976. 3 fig, 1 tab.

Descriptors: *Networks, *Instrumentation, *Nuclear powerplants, *Michigan, *Lake Michigan, On-site investigations, Cooling water, Cooling towers, Powerplants, Winds, Temperature, Air temperature, Water temperature, Humidity, Precipitation(Atmospheric), Rain gages, Fog, Solar radiation, Measurement, Lakes, Coasts, Meteorology, *Air pollution effects.
Identifiers: *Nuclear powerplant effects.

Twenty-five meteorological stations are in operation inland from two nuclear power plants located on the Lake Michigan shoreline in southwestern lower Michigan. Their purpose is to provide data to enable meteorological effects of mechanical-draft cooling towers at the Palisades Nuclear Plant and a once-through cooling system at the Donald C. Cook Nuclear Plant to be evaluated. Temperature, relative humidity, and precipitation are measured at all stations, total solar radiation and wind velocity at four, and visibility at three. The stations, equipment, and calibration methods were described, and examples of types of meteorological analyses were presented. (Sims-ISWS)

SIMPLE FORMULAE FOR THE ESTIMATION OF WET BULB TEMPERATURE AND PRECIPITABLE WATER,
Meteorological Office, Poona (India).
S. J. Reddy.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 27, No. 2, p 163-166, April 1976. 3 tab, 4 ref.

Descriptors: *Meteorological data, *Formulas, *Equations, Temperature, Air temperature, Humidity, Pressure, Atmospheric pressure, Water vapor, Weather data, Data processing, Correlation analysis, Regression analysis, Meteorology.
Identifiers: Precipitable water, Estimation equations, Wet bulb temperature.

A simple formula was developed for computing wet bulb temperature on electronic computers from dry bulb temperature, relative humidity, and pressure. The results obtained with the equation were compared with observed values and were found to be in good agreement. A simple relation was also derived between wet bulb temperature and precipitable water. The results obtained with this equation were compared with the observed values and were found to be in good agreement. (Sims-ISWS)

AREA-DEPTH RELATIONS FOR FREQUENCY VALUES OF RAINFALL,
Meteorological Office, New Delhi (India).
N. Tripathi.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 27, No. 2, p 173-176, April 1976. 2 fig, 2 tab, 5 ref.

Descriptors: *Rainfall, *Depth-area curves, *Depth-area-duration analysis, Precipitation(Atmospheric), Data processing, Networks, Rain gages, Foreign countries, Meteorological data, Weather data, Foreign research, Rainfall disposition, Weather patterns, Hydrologic data, Meteorology.
Identifiers: *India.

Based on rainfall data of 11 dense networks of rain gauges, area-depth curves for frequency values of rainfall for Indian regions were drawn and presented in this paper. The curves are for durations of 1, 3, 6, and 24 hours and for small basins up to 1000 sq km. An equation giving the area-depth relation for any duration was also worked out. (Sims-ISWS)
W77-06647

AN APPROXIMATING POLYNOMIAL FOR THE COMPUTATION OF SATURATION VAPOR PRESSURE,
Naval Environmental Prediction Research Facility, Monterey, Calif.
P. R. Lowe.
Journal of Applied Meteorology, Vol. 16, No. 1, p 100-103, January 1977. 1 fig, 1 tab, 7 ref.

Descriptors: *Saturation, *Vapor pressure, *Mathematical models, Numerical analysis, Atmosphere, Temperature, Thermodynamics, Moisture, Meteorological data, Algorithms.
Identifiers: *Polynomial procedure, Saturation vapor pressure, Atmospheric phenomenon.

A procedure for computing saturation vapor by means of a polynomial approximation was evaluated against other methods then in use. The polynomial procedure consumes a minimal amount of time, without sacrificing acceptable accuracy with respect to the standard. A literature review showed eleven different procedures for computing vapor pressure. These 11 procedures were divided into 2 basic categories: those that require exponentiation, and those that take the form of a polynomial. The requirement for doing an exponentiation, whether the base is e or 10, violates the criterion of economy of computing time. Yet, polynomial-type procedures characteristically have been inaccurate. The polynomial procedure was demonstrated to be highly accurate and more economic of computational time requirements than other procedures. (Roberts-ISWS)

CLIMATOLOGY FOR GEOGRAPHERS,
California Univ., Los Angeles, Dept. of Geography.
W. H. Terjung.
Annals of the Association of American Geographers, Vol. 66, No. 2, p 199-222, June 1976. 9 fig, 120 ref.

Descriptors: *Climatology, *Reviews, *Methodology, Climates, Research priorities, Atmosphere, Evapotranspiration, Rainfall, Precipitation(Atmospheric), Water vapor, Humidity, Energy, Energy transfer, Geomorphology.
Identifiers: *Geography, Geographers, Physical geography.

Climatology was reviewed and redefined in terms of relevance to geography, and a programmatic statement for future research was presented. Instead of enumerating substantive areas, physical geography was defined and ranked according to five levels of methodology and attendant philosophy. The essence of geographical climatology is the analysis and description of process-response systems of importance to mankind occurring within the planetary boundary layer, interface, and substrates. The future of a climatology useful to geographers appears to lie in the numerical modeling of such systems. (Sims-ISWS)

Descriptors: *Chemistry of precipitation, *Model studies, *Precipitation(Atmospheric), *Fallout, *Mathematical models, Rain, Rainwater, Weather, Rainfall, Rainfall intensity, Air pollution, Pollutants, Water quality, Chemical analysis, Chemical precipitation.
Identifiers: *Quantitative models, Wet fallout, Mineral constituents, Mineral nutrients.

In view of present concern over air pollution, spatial models and display of chemicals in rainwater become increasingly important. This publication attempted a contribution at three levels: (1) understanding the processes which are responsible for the negative exponential relationship between elemental concentration and precipitation, (2) attempting to quantify the negative exponential function for seven common elements and compounds, and (3) applying this information to produce computerized spatial displays (maps) of washout, rainout, and total wet fallout patterns in the United States for several chemicals. INVESTIGATION OF THE EFFECTS OF NONHOMOGENEOUS (OR NONSTATIONARY) BEHAVIOR ON THE SPECTRA OF ATMOSPHERIC TURBULENCE,
Bolt Beranek and Newman, Inc., Cambridge, Mass.
W. D. Mark, and R. W. Fischer.
NASA Contract Report 2745, October 1976. 113 p, 26 fig, 1 tab, 19 ref, 8 append. NASA NAS1-13709.

Descriptors: *Turbulence, *Atmosphere, *Model studies, Mathematical models, Numerical analysis, Equations, Winds, Meteorology.
Identifiers: *Atmospheric turbulence, Power spectra, Nonhomogeneous turbulence.

This report examined the effects of nonhomogeneous or nonstationary envelope behavior on the power spectra of atmospheric turbulence records. The principal vehicle used in the study was a new series expansion of the instantaneous power spectrum that has for its first term the usual quasi-stationary spectrum approximation. The minimum duration of a burst of turbulence and the minimum rise-time of an abrupt onset of turbulence that will not give rise to changes in the spectrum due to the nonstationary behavior were determined. A general criterion for envelope behavior that will not give rise to changes in the spectrum was also determined. Spectra computed from recorded turbulence time histories were shown to be consistent with the theoretical predictions. (Sims-ISWS)

Identifiers: Climate, Hungary, *Rainwater measurement.

The nutrient cycle is strongly geared to the hydrologic cycle. Definitions of throughfall, stemflow, interception, etc. are given, and the design of investigations on the hydrologic cycle of a sessile oak forest (Quercetum petraecae-cerris) is described in the framework of the 'Sikfokut Project' within the UNESCO (United Nations Educational Scientific and Cultural Organization) research program 'Man and Biosphere'. The sample area (100 by 100 m basic quadrat) is situated in the Bukk Mountains (Hungary). In a 50 by 50 m plot, the climate and water budget are investigated. Fourteen troughs 20 cm wide and 1 m long are randomly distributed to measure the rainwater under the forest canopy. Stemflow of 14 mean diameter trees is measured using polyurethane collars at a height of 1.30 m. Incident precipitation will be estimated above the tree crowns at the top of a 24 m high tower erected within the same plot. Investigations on precipitation and analysis of the nutrient content of rainfall passing through the canopy started in 1974.--Copyright 1976, Biological Abstracts, Inc.

Identifiers: *Temperature profiles, *NOAA-4.

Presented herein was a method of retrieving single field of view (FOV) tropospheric temperature profiles directly from cloud-contaminated radiance data through the use of auxiliary data such as observed shelter temperature and estimated cloud-top height. It was shown that a well-defined temperature profile may be calculated from the radiative transfer equation (RTE) for a partly cloudy atmosphere when the average fractional cloud amount and cloud-top height for the FOV are

known. A cloud model was formulated to calculate the fractional cloud amount from an estimated cloud-top height. The method was then examined through use of simulated radiance data calculated through vertical integration of the RTE for a partly cloudy atmosphere using known values of cloud-top height(s) and fractional cloud amount(s). Temperature profiles were retrieved from the simulated data, assuming various errors in the cloud parameters. Temperature profiles were retrieved from NOAA-4 satellite-measured radiance data obtained over an area dominated by an active cold front and with considerable cloud cover. Excellent radiosonde data for 11 stations participating in the Atmospheric Variability Experiment (AVE III) available for the area were used for comparison with temperature profiles retrieved from the NOAA-4 data. The effects of using various guessed profiles and the number of iterations were considered. (Sims-ISWS)

TIME-DISTRIBUTION OF STORM RAINFALL IN PENNSYLVANIA,
Pennsylvania State Univ., University Park. Inst. for Research on Land and Water Resources.
R. L. Kerr, T. M. Rachford, B. M. Reich, B. H. Lee, and K. H. Plummer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 251, Price codes: A09 in paper copy, A01 in microfiche. June, 1974. 173 p, 33 fig, 33 tab, 27 ref, 3 append.

Descriptors: *Time, *Storm water, *Storms, *Rainfall, *Pennsylvania, Rain gages, Floods, Antecedent precipitation.

A sample of 1623 storms obtained from the rainfall charts of 46 recording rain gage stations throughout Pennsylvania were analyzed. Each storm was large enough to have produced a flood, given the proper antecedent conditions. Percentage rainfall occurring in successive 5%, 10%, 25%, and 33.3% time intervals of storm duration were calculated for each storm. Ten percent of duration was best for noticing possible trends. Techniques used to identify storms with similar patterns included calculating a median mass curve for storms in each group, calculating limit curves including 80% of the data points around this median line, and calculating statistics for the percentage rainfall in each interval of 10% duration. A sample of 405 antecedent precipitation events associated with flood-producing storms in Pennsylvania was also analyzed. Antecedent rainfalls associated with each storm were listed for seven sequential 24 hr periods immediately before the start of the storm. Antecedent precipitation distributions were somewhat different during the growing and dormant seasons. Regional variations across Pennsylvania were insignificant. The occurrences of antecedent rainfalls were nearly independent statistically from the ensuing flood-producing storms. (Snyder-FIRL)

2C. Snow, Ice, and Frost

SUPRAPERMAFROST WATER,
Alaska Univ., College. Inst. of Water Resources.
G. L. Guymon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 955, Price codes: A02 in paper copy, A01 in microfiche. Report No. IWR-53, June 1974, 11p. OWRT C-4049 (No. 9010)(3).

Descriptors: *Permafrost, Cold-regions, Soil mechanics, Moisture, *Hydraulic conductivity, *Soil water movement, Model studies, Heat balance, Soil moisture, Freezing, Thawing, Convection, Boundary processes.
Identifiers: *Suprapermafrost water, *Freezing soils, *Thawing soils.

The objective was to extend the quantitative knowledge of the soil-water regime of permafrost soils as it is related to hydrological analysis. Research indicated that the most dynamic and perhaps most important soil water behavior occurs during the winter. There is evidence that a significant amount of water is lost to the atmosphere from the frozen soil. Evidence also suggests that an appreciable amount of heat may be convected by moisture migration. In most instances, water is driven by hydraulic gradients produced by the freezing part of the soil profile. In addition, a one-dimensional, coupled heat and moisture transport model was developed for freezing and thawing soils. The most important result to come from the modeling effort was the conclusion that such modeling, when applied on a regional basis, is of little applied value unless means are perfected for determining accurately (1) the hydraulic conductivity parameter for freezing soils, (2) the ice-water ratio function, and (3) the boundary conditions at the soil surface for both moisture and thermal states. (Hartman-Alaska)

LABORATORY STUDY OF THE FLEXURAL STRENGTH AND ELASTIC MODULUS OF FRESHWATER AND SALINE ICE,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
J. C. Tatinclaux, and C. Y. Wu.
IIHR Report No 190, June 1976. 148 p, 53 fig, 32 tab, 9 ref, 2 append. Army DACA89-75-G-052.

Descriptors: *Ice, *Strength, *Elasticity(Mechanical), *Laboratory tests, Strength of materials, Ice loads, Freshwater, Saline water, Salinity, Crystals, Temperature, Equipment, Loads(Forces), Mechanics.
Identifiers: *Bending strength, *Elastic modulus.

Results are presented of a laboratory investigation of the bending strength and elastic modulus of seeded, freshwater and saline ice. Small freshwater ice beams with homogeneous temperature distribution were tested under concentrated load and pure bending applied either on the top or on the bottom surface of the specimens. Freshwater ice and saline ice beams were also tested under pure bending in a water bath. The significant difference in the values of sigma and E obtained with freshwater ice samples at homogeneous temperature, depending on whether the specimens were loaded on the top or bottom surface, was attributed to the variation in ice crystal size between the top and bottom surfaces of the ice sheet. No noticeable effect of loading rate on the flexural strength of bath freshwater and saline ice was found, while the elastic modulus appeared to increase slightly with increasing loading rate. Air temperature was found to have only a minor effect on strength and elastic modulus, at least in the range of temperature investigated. On the other hand, both the bending strength and the elastic modulus were found to be very rapidly decreasing functions of the square root of the brine volume. In view of the difficulties encountered during the experimental program and in the interpretation of the results, it was recommended that further investigation be carred out on the effect of specimen dimensions, testing methods, ice crystal size, and size and distribution of brine pockets on the flexural strength and elastic modulus of saline ice. AN ANNULAR FLOW ICE-WATER MODEL HEAT SINK,
Cold Regions Research and Engineering Lab., Hanover, N. H. Experimental Engineering Div.; and Cold Regions Research and Engineering Lab., Hanover, N. H. Northern Engineering Research Branch.
J. L. Brown, and W. F. Quinn.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-015 468, Price Codes: A04 in paper copy, A01 in microfiche. Special Report 236, September 1975. 71 p, 16 fig, 26 ref, 7 append.

Descriptors: *Powerplants, *Water cooling, *Ice, *Ice-water interfaces, Heat transfer, Melting, Nuclear powerplants, Nuclear reactors, Cooling water, Model studies, Computer models, Laboratory tests.
Identifiers: *Heat sinks, Reactor coolants.

An analytical and laboratory experimental study was conducted on a scale model annular flow ice-water heat sink. The study developed: (1) an understanding of the flow processes and melting patterns in such a sink, (2) a mathematical procedure for predicting relationships between coolant water and heat rejection rates, (3) a validation of the math procedure using a scaled experiment model, and (4) an assessment of the effect of some water inlet manifold configurations. Advantageous performance characteristics include provision for (1) maximum thermal efficiency during the early (probably most crucial) stages of use, and (2) a relatively constant outlet sink temperature to the power plant heat exchanger during the ice melting period. DEVON ISLAND ICE CAP: CORE STRATIGRAPHY AND PALEOCLIMATE,
Department of Energy, Mines and Resources, Ottawa (Ontario). Polar Continental Shelf Project.
R. M. Koerner.
Science, Vol. 196, No. 4285, p 15-18, April 1, 1977. 4 fig, 1 tab, 21 ref.

Descriptors: *Ice, *Climatology, *Polar regions, *Canada, Freezing, Ablation, Melting, Melt water, Glaciers, Ice cover, Seasonal, Sea ice, Climates, Stratigraphy, Cores, Core logging, Cold regions.
Identifiers: *Ice caps, Devon Island ice cap(NWT).

Valuable paleoclimatic information can be gained by studying the distribution of melt layers in deep ice cores. A profile representing the percentage of ice in melt layers in a core drilled from the Devon Island ice cap plotted against both time and depth showed that the ice cap has experienced a period of very warm summers since 1925, following a period of colder summers between about 1600 anf 1925. The earlier period was coldest between 1680 and 1730. There is a high correlation between the melt-layer ice percentage and the mass balance of the ice cap. The relation between them suggests that the ice cap mass balance was zero (accumulation equaled ablation) during the colder period but is negative in the present warmer one. There is no firm evidence of a present cooling trend in the summer conditions on the ice cap. A comparison with the melt-layer ice percentage in cores from the other major Canadian Arctic ice caps shows that the variation of summer conditions found for the Devon Island ice cap is representative for all the large ice caps for about 90% of the time. There is also a good correlation between melt-layer percentage and summer sea-ice conditions in the archipelago. This suggests that the search for the northwest passage was influenced by changing climate, with the 19th-century peak of the often tragic exploration coinciding with a period of very cold summers. RIVER BASIN SNOW MAPPING AT THE NATIONAL ENVIRONMENTAL SATELLITE SERVICE,
National Environmental Satellite Service, Washington, D.C.
S. R. Schneider, D. R. Wiesnet, and M. C. McMillan.
NOAA Technical Memorandum NESS 83, November 1976. 19 p, 8 fig, 1 tab, 17 ref.

Descriptors: *River basins, *Snow surveys, *Mapping, Satellites(Artificial), Snowfall, Snow cover, Meteorology, Meteorological data, Flood forecasting, Data collections.
Identifiers: *National Environmental Satellite Service(NESS), Photo-interpretative techniques, Radiometers, Snow measurement.

The development of the operational river basin snow mapping program at the National Environmental Satellite Service was described. Satellite-derived areal snow cover measurements were provided for over 20 river basins to federal and state agencies around the United States. The snow maps were made, and results were disseminated within 24 hours of a satellite pass over a study basin. The satellite sensors used in snow mapping, the methodology, possible sources of error, and quality control techniques also were described. The key element in the application of snow mapping to hydrological forecasting was the decision to map snow distribution basin by basin. This decision made the data applicable to modeling and to the buildup of data sets of climatic significance. Reliable snow cover data had never before been available to the climatologists and hydrologists. The statistical analysis of such data sets should be a powerful new tool that can be applied to river forecasting in local basins as well as to continental climatic studies. (Roberts-ISWS)

EVAPORATION AND ADVECTION II: EVAPORATION DOWNWIND OF A BOUNDARY SEPARATING REGIONS HAVING DIFFERENT SURFACE RESISTANCES AND AVAILABLE ENERGIES,
Department of Scientific and Industrial Research, Lincoln (New Zealand). Crop Research Div.
K. G. McNaughton.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 431, p 193-202, January 1976. 1 fig, 6 ref, 1 append.

Descriptors: *Evaporation, *Advection, *Surfaces, *Energy, Homogeneity, Latent heat, Vapor pressure, Heat transfer, Heat resistance, Model studies, Equations, Mathematical studies.
Identifiers: *Surface resistance, Bowen ratio, Sensible heat, Moisture transfer, Heat flux, Net radiation, Psychrometric constant.

Using the model and methods developed in Part I of this study, it was shown that steady-state evaporation, downwind of a sharp boundary separating uniform regions with constant but different surface resistances and available energies, can be written as LE = (s/(s + gamma)) (Rn -G) + (s/(s + gamma)) (1/r(r'(Rn' -G') -r(Rn -G)) Phi, where Phi is a dimensionless 'exchange function' that decreases from unity to zero as distance increases downwind of the boundary. The symbols have their conventional meanings, and the primes signify upwind values. The form of Phi depends (1) on the profiles of wind speed and effective diffusivity, and (2) on the downwind surface resistance and temperature via the parameter (gamma) r/l(s + gamma). Empirical expressions for Phi were obtained (1) from a known solution of the atmospheric diffusion equations, assuming power law forms of the wind speed and effective diffusivity profiles, and (2) from a simple model assuming perfect vertical mixing and constant wind speed beneath an impermeable inversion base. These may give some indication of the form and magnitude of Phi at small and at large distances respectively. (Jones-ISWS)

PROFILES AND EVAPORATION,
Rothamsted Experimental Station, Harpenden (England).
H. L. Penman, and I. F. Long.
Quarterly Journal of the Royal Meteorological Society, Vol. 102, No. 434, p 841-855, October 1976. 10 fig, 1 tab, 3 ref.

Descriptors: *Evaporation, *Stability, *Profiles, *Equations, Humidity, Temperature, Weight, Winds, Transportation, Shear stress, Crops.
Identifiers: Weighting factors, Lapse rate, Kale.

In all conditions of stability, either of two slightly different profile equations could be used, both carrying built-in stability weighing factors for use in transport equations. Profiles of wind, temperature, and humidity, above and within two large plots of kale (one irrigated), were studied in detail for short periods of strong lapse and strong inversion. The objectives of the study were to show the high quality in anemometry needed to exploit the profile equation, to demonstrate a way of correcting for zero errors in the thermometry, and to show that above the crop, the profiles of wind and water vapor pressure have the same shape. Within the crop, in both lapse and inversion, the top of the crop is the source or sink for sensible heat transfer. In a humidity inversion, the top is also the sink for latent heat transfer. But in a lapse, the source is at, or close to, the virtual sink momentum. (Roberts-ISWS)

COMPREHENSIVE MONITORING OF METEOROLOGY, HYDRAULICS, AND THERMAL REGIME OF THE SAN DIEGO AQUEDUCT, CALIFORNIA,
Geological Survey, Bay St. Louis, Miss. Water Resources Div.
H. E. Jobson, and A. M. Sturrock, Jr.
Open-file report 76-628, August 1976. 102 p, 31 fig, 6 tab, 5 ref.

Descriptors: *Energy budget, *Hydrologic cycle, *Aqueduct, *California, *Evaporation, Canals, Data collections, Methodology, Water temperature, Meteorological data, Wind velocity, Solar radiation, Vapor pressure, Flow rates, Evaluation, Forecasting, *Monitoring.
Identifiers: *San Diego Aqueduct(Calif), Concrete-lined canal, Atmospheric radiation, Hydraulic variables.

Water temperature, as well as meteorologic and hydraulic variables which influence the energy budget of the San Diego Aqueduct in southern California, were continuously monitored for a 1-year period beginning July 24, 1973. Incoming solar and atmospheric radiation, windspeed and direction, water temperature, and wet- and dry-bulb air temperatures were recorded at 10-minute intervals at each end of the 26-km concrete-lined canal, while flow rates and stages were determined at hourly intervals for five locations. Although only daily averaged values are presented in this report, all information necessary for the use and interpretation of these data are presented. Windspeeds were minimum during the early morning hours and maximum during the late afternoon; however, they were variable spatially. On the other hand, incoming radiation and absolute vapor pressure varied little from point to point. (Woodard-USGS)

SURFACE WATER NETWORK DESIGN BY REGRESSION ANALYSIS SIMULATION,
Geological Survey, Reston, Va. Water Resources Div.
M. E. Moss, and M. R. Karlinger.
Water Resources Research, Vol 10, No 3, p 427-433, June 1974. 7 fig, 1 tab, 5 ref.

Descriptors: *Network design, *Surface waters, *Streamflow, *Regression analysis, Methodology, Synthetic hydrology, Stochastic processes, Flow rates, Average flow, Regional analysis, *Simulation analysis.

The statistical characteristics of the accuracy of regression analyses as used in surface water regionalization are investigated by simulating logarithmic regressions of the streamflow parameters, mean and standard deviation, derived from synthetic streamflow sequences. Accuracy is measured in terms of equivalent years of at-site record. A procedure for the design of surface water data networks that accounts for the statistical nature of the estimates of parameter accuracy is presented. (Woodard-USGS)

Descriptors: *Delaware River, *History, *Pleistocene epoch, *River flow, *Seismic studies, Geology, Sedimentology, Valleys, Delaware, Maryland.
Identifiers: *Ancestral channels, Directional flow.

During times of lowered sea level, the rivers along the east coast of the United States flowed across the subaerially exposed continental shelf. The ancestral channels of these rivers were subsequently buried or partially obliterated by erosion during sea-level transgressions. As a result, only a few channels have been traced across the shelf. Seismic-reflection profiles indicate that during the Pleistocene the Delaware River flowed across the continental shelf east of Delaware Bay and emptied into Wilmington Submarine Canyon. The ancestral valley (width, 3 to 8 kilometers; relief, 10 to 30 meters) is buried, is not reflected in the surface topography, and probably predates the formation of the present canyon head. (Woodard-USGS)

FLOODS IN LOUISIANA, MAGNITUDE AND FREQUENCY, THIRD EDITION,
Geological Survey, Baton Rouge, La. Water Resources Div.
B. L. Neely, Jr.
Louisiana Department of Highways, Baton Rouge, 1976. 340 p, 16 fig, 1 tab, 17 ref.

Descriptors: *Floods, *Louisiana, *Historic floods, *Frequency analysis, *Flood data, Flood forecasting, Regression analysis, Equations, Maximum probable flood, Peak discharge, Rainfall-runoff relationships, Hydrologic data, Gaging stations, Drainage area, Natural flow, Flood recurrence interval, Flood control.

Techniques are presented for estimating the magnitude and frequency of peak discharges on streams in Louisiana. A comprehensive analysis was made in which physical and climatic characteristics of river basins are related to flood characteristics at gaging stations. Equations derived from the analysis make it possible to estimate the magnitude of peak discharges with recurrence intervals of 2 to 100 years on streams that have drainage areas less than 3,000 square miles if the drainage-area size, main-channel slope, and mean annual precipitation are known. The equations should not be used where regulation by man appreciably affects flood runoff. Data from 170 gaging stations with 9 or more years of record were used in the analysis. Flood frequency at each gaging station was computed by fitting a log-Pearson Type III distribution to gaging-station data. Flood records for all gaging stations in Louisiana are tabulated. Graphical relations of maximum floods of record to drainage area at gaging stations are shown to provide a guide to maximum probable floods. A method is described for estimating the magnitude and frequency of peak discharges on streams for urban areas in Louisiana. (Woodard-USGS)

FURTHER DEVELOPMENT AND TESTING OF A STREAM-AQUIFER SYSTEM MODEL,
Kansas Water Resources Research Inst., Lawrence.
E. C. Pogge, and W. L. Chiang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 016, Price Code: A09 in paper copy, A01 in microfiche. KWRRI Contribution No. 185, January 1977. 185 p, 41 fig, 4 tab, 112 ref, 5 append. OWRT A-055-Kan(2).

Descriptors: *Groundwater, *Alluvial aquifers, Model studies, *Mathematical models, *Simulation analysis, *Kansas, Computer programs, Base flow, Flood routing, Channel flow, *Aquifer testing.
Identifiers: *Stream-aquifer models, *Channel routing, Bank seepage, *Walnut Creek Basin(Kan).

A mathematical model was developed from theoretical models, presently available, for simulating the response of an alluvial aquifer to the passage of a flood wave through a stream channel. The model consists of a procedure for routing the flood wave through the channel system, a groundwater flow model, and a method for coupling the stream channel system to the alluvial aquifer. The model was programmed for solution on a digital computer. The primary objective was to test the model on a natural system using historic data. In the testing, the model was applied to a reach of channel in Walnut Creek Basin located in west-central Kansas. Several modifications of the model were necessary to adapt it to the existing physical system. The test program both verified the applicability of the model to a natural physical system and also revealed the type of field data required for the proper application of the model.

Descriptors: *Bibliographies, *Publications, *Groundwater, Subsurface waters, Water resources, Data storage and retrieval, Aquifers, Foreign countries, Karst, Exploration, Water chemistry, Water quality, Management, Planning, Model studies, Surveys, Groundwater resources, Water wells.
Identifiers: *Developing countries(Groundwater).

This bibliography provides a guide to recent work on the subsurface water resources of developing countries. It lists 1,574 reference items, each dealing at least in part with groundwater and related directly to developing countries, published in 1970 or later. There are indexes by country and by subject. The references were collected primarily from nine computerized data bases, but use was made of published bibliographies not specifically dealing with developing countries and of personal compilations contributed by a number of hydrogeologists with international interests and experience. The sources are listed in the appendices together with a number of additional bibliographies not consulted directly. This bibliography is the most complete listing known on the subject of ground water in developing countries. (Heiss-NWWA)

PERFORMANCE OF A RECHARGE AND RECOVERY SYSTEM IN AN AQUIFER WITH UNIFORM FLOW,
Technische Hogeschool, Delft (Netherlands). Geophysical Lab.
P. A. Vermeer, and C. van den Akker.
Hydrological Sciences Bulletin, Vol 21, No 3, p 387-396, September 1976. 8 fig, 2 ref.

Descriptors: *Potential flow, *Wells, *Theis equation, *Water supply development, *Groundwater recharge, *Recharge wells, Recharge, Groundwater, Analysis, Discharge(Water), Conjunctive use, Steady flow, Unsteady flow, Water storage, Well spacing.
Identifiers: Two-dimensional flow.

Flow from an injection well to a pumping well was considered in an aquifer with an initial uniform flow. Since the capacities of the wells were taken to be equal, it was believed that the wells disturb the uniform flow only locally. However, it was found that downstream from the wells the natural groundwater is replaced by injected water. A formula for this (steady) exchange was derived, assuming an abrupt interface between the two fluids and a constant pumping rate. The additional (unsteady) exchange due to a non-constant rate of injection was computed for the case when the pumping well is placed exactly downstream from the injection well. Under this special condition the steady exchange is equal to zero. (Adams-ISWS)

P. C. Trescott, and S. P. Larson.
Water Resources Research, Vol 13, No 1, p 125-135, February 1977. 13 fig, 1 tab, 20 ref.

Descriptors: *Groundwater movement, *Subsurface flow, *Model studies, *Mathematical models, *Equations, Methodology, Evaluation, Correlation analysis, Aquifer characteristics, Hydrogeology.
Identifiers: *Finite-difference equations.

The efficiency of line successive overrelxation (LSOR) is compared with a two-dimensional correction procedure (2DC), the iterative, alternating direction implicity procedure (ADI), and the strongly implicit procedure (SIP) to solve finite-difference equations used to simulate several groundwater reservoirs. Three of the reservoirs are linear, two are isotropic areal problems, and the third is an anisotropic cross-section simulation. The fourth is a nonlinear water table aquifer with areas of thin saturation. SIP is generally the best method for the linear simulations and with the addition of another iteration parameter is the only method that gives an adequate rate of convergence for the water table problem. LSOR with 2DC is competitive with SIP on isotropic and anisotropic linear problems that are dominated by no-flow boundaries. ADI is generally more efficient than LSOR if a good set of iteration parameters are used, but this advantage is offset by the relative ease of finding the best acceleration parameter for LSOR. 2G. Water In Soils

OREGON'S LONG-RANGE REQUIREMENTS FOR WATER. GENERAL SOIL MAP REPORT WITH IRRIGABLE AREAS, UMATILLA DRAINAGE BASIN,
Oregon State Univ., Corvallis; and Soil Conservation Service, Washington, D.C.
J. A. Norgren, and G. H. Simonson.
Prepared for the Oregon State Water Resources, 1969, Appendix I-7. 73 p, 3 fig, 10 tab, 2 map.

Descriptors: *Soils, *Soil surveys, *Soil profiles, *Soil properties, *Soil types, *Runoff, *Irrigation, *Drainage, *Oregon, Soil texture, Soil moisture, Permeability, Water management(Applied), Root zone.
Identifiers: *Umatilla River Basin(OR), *Available water-holding capacity(AWHC), *Shrink-swell potential, *Erosion hazard, *Temperature limitation.

Soil survey information of the National Cooperative Soil Survey program in Oregon was used to map, describe and interpret soils in the Umatilla River Basin in northern Oregon. Soils are interpreted with regard to water use and management. Soil series consist of soils essentially uniform in characteristics such as texture, structure, arrangement of horizons, etc. Poorly drained and alkali soils with hardpans impeding drainage are found mostly in Umatilla County, with some problems also in Morrow County. Both alkali and drainage conditons can be altered by man's activities. Twelve soil or land characteristics are used in a guide for placing soils in irrigation groups; these characteristics are rated excellent, good/fair, poor, very poor/nonirrigable. Athena, Palouse, Ritzville, Sagemoor (Warden) and Walla Walla soils have excellent irrigation suitability. A total of 36 soil series were found unsuited for irrigation because of stoniness or steep slopes. Soils subject to occasional flooding are Esquatzel, Hermiston, Onyx, Pedigo, Stanfield, Umapine, and Yakima. Soils with the highest potential for runoff are Bakeoven, Bakeoven-biscuit complex, Ephrata-shallow, Lickskillet, McKay, Rock Creek, Rock Creek-Waha complex, Rockland, and Starbuck. All soils are analyzed in terms of runoff, permeability, available water-holding capacity (AWHC), effective root zone, shrink-swell potential, workability, erosion hazard, and temperature limitations. Detailed descriptions are given of soil series and mapping units in the Umatilla Drainage Basin. (Gentry-NC)

Descriptors: *Soils, *Soil surveys, *Soil profiles, *Soil properties, *Soil types, *Infiltration, *Runoff, *Irrigation, *Infiltration rates, *Drainage, *Oregon, Soil texture, Soil moisture, Permeability, Water management(Applied), Root zone.
Identifiers: *Grande Ronde Drainage Basin(OR), *Available water-holding capacity(AWHC), *Shrink-swell potential, *Erosion hazard, *Temperature limitation.

A general soil map and soil descriptions, interpretations and acreage figures are given for 3,180,000 acres of the Grande Ronde Drainage Basin in northeast Oregon, 550,000 acres of which are suited for crop and improved pasture land. Information used in this report is based on data collected by the National Cooperative Soil Survey program in Oregon. The basin has a wide variety of terrain reflecting uplift and deep dissection of lava plateaus, mountain glaciation, and deposition in structural valleys. Aeolian deposits of loess and volcanic ash are widespread. Poorly drained and sodic soils include Wilkins, Haines, Hoopal and Hot Lake Soils. Four irrigation suitability ratings are used for rating 12 soil/land characteristics for irrigability. Soils suitable for irrigation are Alicel, (By), Imbler and Palouse soils. A total of 20 soils are unsuited for irrigation due to slopes greater than 20% and due to stoniness, depth, extreme elevations and temperatures, or some combinations of these factors. Soils subject to occasional flooding are (By), Catherine, Haines, Hot Lake, (Ne), (Sl), Veazie and Wilkins. Soils with the highest potential for runoff are soils shallow to bedrock, claypan, hardpan, clayey soils or poorly drained soils; 9 soils are included in this group. Soils are analyzed in terms of runoff potential, infiltration, permeability, available water-holding capacity (AWHC), effective root zone, shrink-swell potential, workability, erosion hazard, temperature limitations. Soil interpretations relate to water use and management. Descriptions are given of the soil series and mapping units identified in the Basin and shown on the soil map. (Gentry-NC)

OREGON'S LONG-RANGE REQUIREMENTS FOR WATER. GENERAL SOIL MAP REPORT WITH IRRIGABLE AREAS, POWDER DRAINAGE BASIN,
Oregon State Univ., Corvallis; and Soil Conservation Service, Washington, D.C.
M.G. Lindsay, and G. H. Simonson.
Prepared for the Oregon State Water Resources Board, 1969, Appendix I-9. 66 p, 2 fig, 10 tab, 2 map.

Descriptors: *Soils, *Soil surveys, *Soil profiles, *Soil properties, *Soil types, *Infiltration, *Infiltration rates, *Runoff, *Irrigation, *Drainage, *Oregon, Soil texture, Soil moisture, Permeability, Water management(Applied), Root zone.
Identifiers: *Powder Drainage Basin(OR), *Available water-holding capacity(AWHC), *Shrink-swell potential, *Erosion hazard, *Temperature limitation.

A general soil map and soil descriptions, interpretations and acreage figures are presented for 2,048,500 acres of the Powder Drainage Basin in northeast Oregon, 400,000 acres of which are suitable for crops or improved pasture. Soil information presented is needed for general planning of resource development in the Power Basin, with soils being interpreted in terms of water use and management. Soils are analyzed in the Wallowa and Elkhorn Mountains, forested uplands, grassland uplands, and valley lands. Poorly drained and alkali soils are hershal, (Rb), Baldock, Haines, Stanfield and Umapine. Twelve soil/land characteristics are rated for irrigation suitability. Jett and Powder soils are excellently suited for irrigation. Thirty of the 48 soils described are poorly suited for irrigation due to stoniness, texture, depth or temperature, or due to excessive slope. Soils subject to occasional flooding are Baldock, Balm, Catherine, Goodrich, Haines, Hershal, Jett, Langrell, Powder, (Rb), Stanfield, Umapine and Wingville. Soils with greatest potential are soils which are very shallow to bedrock, clayey soils and poorly drained soils, and include Bakeoven, Halfway, Hershal, (Rb), Rock Creek, and rough mountainous land. Soils are analyzed according to runoff, infiltration, permeability, available water-holding capacity (AWHC), effective root zone, shrink-swell potential, workability, erosion hazard and temperature limitation. Descriptions are given of the soil series and land types identified in the Powder Basin and shown on the soil map. Soil information is based on the National Cooperative Soil Survey program in Oregon. (Gentry-NC)

OREGON'S LONG RANGE REQUIREMENTS FOR WATER. GENERAL SOIL MAP REPORT WITH IRRIGABLE AREAS, MALHEUR RIVER DRAINAGE BASIN,
Oregon State Univ., Corvallis; and Soil Conservation Service, Washington, D.C.
B. B. Lovell, M. G. Lindsay, J. A. Norgren, D. W. Anderson, and G. H. Simonson.
Prepared for the Oregon State Water Resources Board, 1969, Appendix I-10. 85 p, 3 fig, 10 tab, 2 map.

Descriptors: *Soils, *Soil surveys, *Soil profiles, *Soil properties, *Soil types, *Infiltration, Infiltration rates, *Runoff, *Irrigation, *Drainage, *Oregon, Soil texture, Soil moisture, Permeability, Water management(Applied), Root zone.
Identifiers: *Malheur River Drainage Basin(OR), *Available water-holding capacity(AWHC), *Shrink-swell potential, *Erosion hazard, *Temperature limitation.

A general soil map and soil descriptions, interpretations and acreage figures are given for 2,879,400 acres of Malheur Drainage Basin located in southeastern Oregon. The Malheur Basin in predominantly hilly, strongly dissected terrain, underlain by old sediments and volcanic rock. Irrigated agriculture is concentrated on the broad terraces and flood plains bordering the Snake River and the lower reaches of the Malheur River and Willow Creek. Physiographic divisions include the low-elevation terraces and flood plains, grass-shrub uplands, small bottomland and basins at higher elevations, and forested uplands. Soils with poor drainage and alkali conditions are located primarily in Malheur and Harney counties, in the South Fork Malheur and Snake River sub-basins. Twelve soil or land characteristics are rated for irrigation suitability; the ratings used are excellent, good/fair, poor, very poor/nonirrigable. Twenty-four soils are unsuited for irrigation due to shallow and stony soils, or due to steep slopes. Soils subject to flooding are Bully, Barbutt, (Gi), Jett, (Ki), Powder, Riverwash, (Sm), Stanfield, Umapine, and Units 1, 3, 10, 15, and 43. Soils are analyzed according to runoff, permeability, available water-holding capacity (AWHC), effective root zone, shrink-swell potential, workability, erosion hazard, and temperature limitation. Soils are interpreted with regard to water use and manage-

OREGON'S LONG-RANGE REQUIREMENTS FOR WATER. GENERAL SOIL MAP REPORT WITH IRRIGABLE AREAS, OWYHEE DRAINAGE BASIN,
Oregon State Univ., Corvallis; and Soil Conservation Service, Washington, D.C.
B. B. Lovell, M. G. Lindsay, J. A. Norgren, D. W. Anderson, and G. H. Simonson.
Prepared for the Oregon State Water Resources Board, 1969, Appendix I-11. 72 p, 3 fig, 10 tab, 2 map.

Descriptors: *Soils, *Soil surveys, *Soil profiles, *Soil properties, *Soil types, *Infiltration, *Infiltration rates, *Runoff, *Irrigation, *Drainage, *Oregon, Soil texture, Soil moisture, Permeability, Water management(Applied), Root zone.
Identifiers: *Owyhee Drainage Basin(OR), *Workability, *Available water-holding capacity(AWHC), *Shrink-swell potential, *Erosion hazard, *Temperature limitation.

A general soil map and soil descriptions, interpretations and acreage figures are given for 3,775,000 acres of the Owyhee Drainage Basin in southeast Oregon, more than 1 million acres of which are suitable for crops and improved pasture. The Owyhee Basin is gently sloping and rolling lava plateau terrain with precipitation between 8 and 12 inches annually, with a short growing season. Elevations range from 2,100 to 7,000 feet. The main irrigated area is along the Snake and lower Owyhee Rivers. Physiographic areas include alluvial bottomlands, nearly level closed basins or bottomlands, grass-shrub covered lava plateau uplands, and canyonlands and mountainous uplands. General locations of poorly drained and alkali soils are given. A guide is presented for irrigation suitability of soils, with ratings given to 12 soil or land characteristics; the ratings are excellent, good/fair, poor, very poor/nonirrigable. Sixteen soils are unsuited for irrigation due to steep slopes or shallow, stony soils; soils subject to occasional flooding and ponding are listed. Soils are analyzed according to runoff, permeability, available water-holding capacity (AWHC), effective root zone, shrink-swell potential, workability, erosion hazard, and temperature limitations. Interpretations of soils are related to water use and management applicable to resource planning. Detailed descriptions of reconnaissance classification units, soil series and mapping units are given. The information used in the report is from the National Cooperative Soil Survey program in Oregon. (Gentry-NC)

DEPTH AND SEASONAL FLUCTUATIONS IN THE CONDITION OF THE GROUNDWATER OF THE AREA AROUND THE CITY OF GHENT (BELGIUM), (IN DUTCH),
Ghent Rijksuniversiteit (Belgium). Laboratorium voor Bodemfysische.
R. Hartmann.
Meded Fac Landbouwwet Rijksuniv Gent 38(2), p 281-293, 1973.

Descriptors: Seasonal, Depth, *Groundwater, *Sands, Rainfall, Evaporation, *Water table, *Water level fluctuations, *Soil texture, Water levels, Measurement.
Identifiers: *Belgium(City of Ghent).

The fluctuations of the ground water-table in sandy soils of this area as results of the interaction between rainfall and evaporation, were measured during a period of 5 yr. The measurements were carried out for 4 different drainage classes. For the sandy soils of Ghent the lowest mean annual level is higher and the highest mean annual level is lower in comparison with sandy soils of the Campine in the province Antwerp. The difference in the fluctuation is due to the finer texture of the sandy soil around Ghent. The average depths of the high and low water-levels, which an be deduced from morphological properties of the soil profile, correspond to the standards of the drainage classes derived from the watertable fluctuations observed during 5 consecutive years.

BONDING OF CALCIUM AND POTASSIUM BY VERMICULITE AND KAOLINITE CLAYS AS AFFECTED BY H-CLAY ADDITION,
Ohio State Univ., Columbus. Dept. of Agronomy.
A. S. Baweja, and E. O. McLean.
Soil Science Society of America Proceedings, Vol. 39, No. 1, p 48-50, January-February 1975. 2 fig, 1 tab, 16 ref.

Descriptors: *Kaolinite, *Calcium, *Potassium, Soils, Soil investigations, *Clays, *Bonding.
Identifiers: *Vermiculite.

The less than 2 micro-m fraction of Libby vermiculite and Peerless kaolinite was separated and H-saturated by resin treatment. The H-clay suspensions were immediately saturated with either Ca or K by addition of the respective hydroxides. Six reciprocal Ca-K saturations of each clay were prepared by mixing the Ca- and K-clays in appropriate amounts. Increments of H-clay were added to lower the base saturation and thereby inactivate the pH-dependent charges. Radioisotopes, 45Ca and 86Rb, were used as tracers for Ca and K, respectively. Two-phase Donnan-type systems were prepared and equilibrated for 23 days. Radioactivity in both phases was then assayed and the amounts of Ca and K retained in the suspension phases of the two clay systems computed. The pH-dependent fraction of the total CEC was 6.9 and 18.0% for vermiculite and kaolinite, respectively. Additions of H-clay increased the bonding of both Ca and K as indicated by greater clay-phase retention. However, maximum retention of the cations at all Ca-K saturation ratios did not occur when the amounts of H-clay added equaled the pH-dependent charge fraction of the clay as had occurred with bentonite and illite. MIXING IN UPPER LAYER OF A LAKE DURING HEATING CYCLE,
Institute of Oceanographic Sciences, Wormley (England).

S. A. Thorpe, and A. J. Hall.
Nature, Vol. 265, No. 5596, p 719-722, February 24, 1977. 5 fig, 5 ref.

Descriptors: *Mixing, *Lakes, *Water temperature, Waves(Water), Winds, On-site investigations, Measurement, Surveys, Instrumentation, Data processing, Stratification, Stability, Heat, Heat transfer, Heating, Temperature, Currents(Water), Internal waves, Freshwater, Limnology.
Identifiers: Billows.

Little is yet known about the structure of the upper 'mixing' layer of the ocean below the zone of direct surface wave influence. Some measurements were reported of the temperature field in the mixing layer of a freshwater lake during the heating cycle. The measurements demonstrate some of the processes which may be important. The temperature field is found to be isotropic at scales less than about 60 cm, but the effect of stratification becomes important at larger scales, reducing the vertical correlations in comparison with the horizontal. The spatial evolution of structures is dominated by the shear, as appropriate in the low Richardson number region. Examination of the stability of the mean velocity and density profiles showed that Kelvin-Helmholtz instability may be expected, leading to billows with wavelengths of about 60 m, and corresponding to fluctuation scales observed in the temperature records. Similar fluctuations were seen in the nocturnal atmospheric boundary layer. (Sims-ISWS)

THE OBSERVED WINTER CIRCULATION OF LAKE ONTARIO,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
R. L. Pickett.
Journal of Physical Oceanography, Vol. 7, No. 1, p 152-156, January 1977. 7 fig, 1 tab, 8 ref.

Descriptors: *Lake Ontario, *Great Lakes, *Winter, *Circulation, Bathymetry, Lakes, Mathematical models, Currents, Temperature, Numerical analysis.
Identifiers: *Lake circulation, *Winter circulation, Lake currents, Gyre pattern, Whole-lake studies.

Lake Ontario's winter circulation had not been observed prior to 1972 because harsh weather and lake ice discouraged the extension of observations past autumn. Previous whole-lake studies were made via surface drift bottles or moored current meters. Hydraulic circulation from inflow-outflow is always small, and thermally driven flow in nearly isothermal water must be small. Therefore, winter currents should be wind driven. Previous wind-driven patterns for Lake Ontario's winter circulation were based on homogeneous, vertically integrated numerical models. The models included both friction and the earth's rotation in transport for a given wind. Another steady-state model predicted 2 counter-rotating gyres induced by the bowl-shaped bathymetry. Transport was with the wind nearshore, and against the wind offshore. A third time-dependent model showed only a one-gyre pattern rotating in the direction of the applied wind curl. Other researchers felt that the dominant pattern depended on the relative strength of the bathymetric-wind curl effects. During the International Field Year for the Great Lakes in 1972-73, the winter circulation of Lake Ontario was finally observed. Data suggested that currents and temperatures are nearly constant with depth, and that the lake-wide mean circulation pattern consists of either one counterclockwise or two counter-rotating gyres. Z. M. Gliwicz.
Ekologia Polska, Vol. 24, No. 2, p. 197-209, 1976. 6 fig., 1 tab., 22 ref.

Descriptors: *Thermal stratification, *Reservoirs, *Subtropic, *Cycling nutrients, *Thermocline, Productivity, Metalimnion, Oxygen sag, Lakes.
Identifiers: *Madden Lake(Panama Canal Zone).

In subtropical Maddel Lake in the Panama Canal Zone the density gradient prevents a substantial portions of the nutrients from cycling within the reservoir. The concentration of nutrients in the euphotic zone induces a steady-state high standing crop and phytoplankton production, with only the more difficult oxidizable organic matter falling to the deeper layers where it is quickly carried away by the colder Rio Chagres water. Madden Lake has a strong thermal stratification of up to 5C differentiation between surface and bottom layers which results from the cool river influents filling the bottom layers of the lake. The steep gradients of water density in the metalimnion correspond to a negative retrograde minima in oxygen depth profiles. Both the steepness and the depth of the density gradient depend on the reach of vertical mixing as well as on the temperature and volume of river influents. Oxygen-saturated river water moving slowly below the metalimnion along the former river beds reduces oxygen deficiency in the hypolimnion; and when the density gradient is sufficiently steep, sinking of organic matter is slowed in the metalimnion producing oxygen minima due to the high respiration intensity of the entire plankton community in the thermocline layer. LAKE CURRENTS AND TEMPERATURES NEAR THE WESTERN SHORE OF LAKE MICHIGAN,
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
G. K. Sato, and C. H. Mortimer.
Special Report No. 22, March 1975. 322 p, 218 fig, 6 tab, 56 ref. AEC AT(11-1)-2158.

Descriptors: *Lake Michigan, *Currents(Water), Winds, *Water temperature, Temperature, Water circulation, Current meters, On-site data collections, Instrumentation, *Thermal pollution, Powerplants, Data processing, Internal waves, Upwelling, Stratification, Lakes, Limnology, *Path of pollutants.

The objective was a description of the variability of nearshore current regimes and temperature fields in the neighborhood of the Wisconsin Electric Company's fossil-fueled, lake-cooled power plant at Oak Creek, Wisconsin. Attention was paid, not to plume geometry and behavior in the near field (except for a study of sinking plumes in winter), but to the ambient lake motions into which the plumes are being discharged. An array of recording current meters and thermographs wasmoored in an area of approximately 15 km alongshore, and the same distance offshore, to provide 10-minute readings of current speed, current direction, and temperature. The currents in the coastal region proved to be mainly responsive to the direction of the wind. Vector frequency diagrams and progressive vector diagrams for monthly or shorter intervals confirmed the predominantly shore-parallel current patterns with greater flow tendancy towards SSE. Current speeds were variable, monthly means were commonly as low as 5 cm/sec, but such means included episodes of very weak currents (less than 4 cm/sec), which in total may have occupied half the month. The current speeds in the other half ranged from 4 to over 30 cm/sec. Before stratification had become established in June, temperature records showed steady increases and no large variations, but after stratification, the effects of upwelling and downwelling events became apparent, associated with north-going and south-going currents, respectively. The onset of upwelling and downwelling was signalled by a respective drop or rise in temperature, often sudden and common-associated with a reversal in current flow. (See also W75-11190) (Sims-ISWS)

CHANGES IN THE STRUCTURE OF PHYTOPLANKTON DURING THE FIRST YEARS OF EXISTENCE OF THE DERDAP STORAGE RESERVOIR, (IN SERBO-CROATIAN),
Institute for Biological Research, Belgrade (Yugoslavia).
D. Milovanovic.
Arh Biol Nauka 15(1/2), p 75-84, 1973.

Descriptors: *Phytoplankton, *Reservoirs, Habitats, *Environmental effects, Hydroelectric plants, Diatoms, Chlorophyta.
Identifiers: Microcystis aeruginosa, *Yugoslavia(Derdap Reservoir).

The qualitative and quantitative changes in the structure of phytoplankton in a water medium modified morphometrically and hydrologically by the construction of the Derdap water power system (Yugoslavia) were analyzed in detail. The phytoplankton has retained its original autochthonous biocenotic composition of a Diatomeae-Chlorophyceae type along the longitudinal profile of the reservoir. New components of the phytoplankton community were registered during 2 summers. An ecologically and trophically characteristic species Microcystic aeruginosa, was abundant.--Copyright 1976, Biological Abstracts, Inc.

EXPERIMENT WITH A MULTIPOINT SYSTEM FOR JUDGING CARP FATTENING PONDS, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kiev (USSR).
G. I. Shpet, and N. N. Nharitonova.
Gidrobiol Zh 11(2), p 51-59, 1975.

Descriptors: *Productivity, *Carp, *Ponds, *Freshwater fish, Dimensions, Flow, Depth, Hydrogeology, Water chemistry, Climatic zones, Fish.
Identifiers: Productivity indexes, Water exchange, Ukrainian-SSR, USSR.

A multipoint system is suggested for determination of natural fish productivity from 18 indices taking into account the pond dimensions, water exchange, depths, ground conditions, hydrochemistry and other factors. Dekpending on the optimum, medium or minimum value of each index, the respective percentage is added to or subtracted from the initial value. This yields a value of natural fish productivity. The results of this method of examination in 17 ponds in 3 climatic zones of the Ukrainian S.S.R. (USSR) are presented.--Copyright 1976, Biological Abstracts, Inc.

LAKE ST. CLAIR HYDROLOGIC TRANSFER FACTORS.
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
F. H. Quinn.
NOAA Technical Memorandum ERL GLERL-10, July 1976. 19 p, 1 fig, 16 tab, 3 ref.

Descriptors: Hydrology, *Lakes, Water resources, *Precipitation(Atmospheric), *Evaporation, *Runoff, *Storage, Rainfall-runoff relationships.
Identifiers: *Lake St. Clair, *Transfer factors(Hydrologic).

Monthly hydrologic transfer factors were developed for Lake St. Clair for the period 1950-1974 to aid in the comparison and coordination of St. Clair and Detroit River monthly flows. The transfer factor is defined as the sum of the monthly precipitation and runoff minus the evaporation and change in storage. Each of the hydrologic constitutents were determined independently from available data. (NOAA)

LAKE ONTARIO ATLAS: SURFACE WAVES,
New York Sea Grant Inst., Albany.
G. E. Myer.
New York Sea Grant Institute Lake Ontario Atlas Monograph No. NYSSGP-OA-77-004, 1977. 109 p, 56 fig, 64 ref.

Descriptors: *Lake Ontario, *Lakes, *Water levels, Seiches, Gravity waves, Wind tides, Surges, Tides, Data collection.
Identifiers: Atlases, Surface waves, Astronomical tides.

An analysis of gravity waves, seiche, wind tides, and long-term variations in lake level is provided. A computerized analysis details the dynamics of each effect. Specific storm effects are analyzed and an example of hindcasting of wind velocity v. wave height is explained. Although records of water levels through 1974 indicate that the average lake surface elevation has varied as much as 2 m, locally the variations in water level have been greater than this. Some of the changes have been aperiodic, others have followed a long period, and many were somewhat periodic but with short periods. This monograph has been written as a summary of much of what is now known about these locally observed time dependent water level variations in Lake Ontario. (NOAA)

NUMERICAL MODELS OF WIND-DRIVEN CIRCULATION IN LAKES,
Geological Survey, Menlo Park, Calif. Water Resources Div.
R. T. Cheng, T. M. Powell, and T. M. Dillon.
Applied Mathematical Modelling, Vol 1, p 141-159, December 1976. 11 fig, 1 tab, 99 ref.

Descriptors: *Lakes, *Water circulation, *Winds, *Mathematical models, Numerical analysis, Equations, Finite element analysis, Analytical techniques, Hydrodynamics, Turbulence, Mixing, Shallow water, Gravity waves, Evaluation.
Identifiers: *Three-dimensional models, *Ekman-type models.

The state-of-the-art of numerical modelling of large-scale wind-driven circulation in lakes is presented. The governing equations which describe this motion are discussed along with the appropriate numerical techniques necessary to solve them in lakes. The numerical models are categorized into three large primary groups: the layered models, the Ekman-type models, and the other three-dimensional models. Discussions and comparison of models are given and future research directions are suggested. (Woodard-USGS)

INFLUENCE OF GRADIENT ON THE DISTRIBUTION OF FISHES IN CONOWINGO CREEK, MARYLAND AND PENNSYLVANIA,
Ichthyological Associates, Inc., Durmore, Pa.
C. H. Hocutt, and J. R. Stauffer.
Chesapeake Science, Vol. 16, No. 1, p. 143-147, 1975. 2 tab, 3 fig, 17 ref.

Descriptors: *Streams, *Gradients(Streams), Flow, *Gradation, *Distribution, *Distribution patterns, *Spatial distribution, *Fish, *Environmental effects, Freshwater fish, Analytical techniques, Sampling, Stream fisheries, Suckers, Minnows.
Identifiers: *Conowingo Creek(Md-Pa), Rhinichthys atratulus, Notropis cornutus, Catostomus commersoni, Exoglossum maxillingua.

Twenty-seven fish species were collected from Conowingo Creek at eleven stations during the summer, 1970. Species most abundant were Rhinichthys atratulus, Notropis cornutus, Exoglossum maxillingua, Semotilus atromaculatus and Catostomus commersoni. A Spearman's rank correlation coefficient matrix was calculated for biological and physical parameters. Distribution of fishes appeared related to width and depth of the stream, but was most influenced by gradient. (Katz)

FOAM AND FILM OF FRESH WATERS AS AN ECOLOGICAL NICHE OF AQUATIC HYPHOMYCETES, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Botaniki.
I. A. Dudka, and V. I. Beregovaya.
Gidrobiol Zh 11(4), p 80-86, 1975.

Descriptors: *Freshwater, *Aquatic fungi, *Organic compounds, *Dissolved solids, *Suspended solids, *Productivity, Ecology, Proteins, *Films, Foaming.
Identifiers: Conidia, Organic detritus, *Foam, *Hyphomycetes.

The natural foam and film of freshwaters, which are composed of a concentration of surfaceactive organic substances and contain solid mineral particles, and dissolved suspended organic compounds, form a complex 3-phase system. The presence in them of high concentrations of protein substances, sources of C, phosphates, Nitrates, Nitrites, and a vast quantity of organic animal and vegetable detritus, creates conditions which preserve the viability of Conidia of aquatic hyphomycetes and permit their growth on appropriate substrates (fragments of the leaves of trees and shrubs). The surface foam and film enable the conidia to be spread by waterfowl, wind and water current. The foam and film are regarded as an ecological niche of aquatic hyphomycetes.--Copyright 1976, Biological Abstracts, Inc.

INDICATOR VALUES OF VASCULAR PLANTS IN CENTRAL EUROPE, (IN GERMAN),
Goettingen Univ. (West Germany). Systematisch-Geobotanisches Institut.
H. Ellenberg.
Scr Geobot 9, p 1-97, 1974.

Descriptors: *Bioindicators, *Climates, Light, Temperature, Distribution, Soil moisture, Nitrogen, Acidity, *Soil chemical properties, Salinity, Heavy metals, *Ecology, Plant physiology, *Europe.
Identifiers: *Vascular plants.

A comprehensive synopsis of the indicator values of about 200 spp. (or microspecies) of vascular plants in west central Europe is given. The so-called ecological behavior of the plants is briefly expressed by figures representing 9 degrees of behavior with regard to the main environment factors. Three figures relate to climatic factors, light, temperature and continentality of the distribution range. The following 3 figures relate to soil factors, moisture, acidity and N supply. Salinity and concentration of heavy metals are discussed. In addition to the ecological behavior, morphological, anatomical and phytosociological information is given.--Copyright 1976, Biological Abstracts, Inc.

DEPENDENCE OF WATER ABSORPTION BY THE CELL WALLS OF PLANT LEAVES ON THE VOLUME OF THE FREE SPACE, (IN RUSSIAN),
Kazan Inst. of Biology (USSR).
L. A. Shishkina, and A. M. Alekseev.
Fiziol Biokhim Kul'T Rsat 7(3), p 323-325, 1975.

Descriptors: *Absorption, *Cytological studies, Plant morphology, *Beans, *Wheat, Leaves.
Identifiers: *Millet, *Leaf mesophyll.

The rate of water movement into the cell walls of the leaf mesophyll, during the exclusion of transpiration, was studied in beans, spring wheat, and millet. This index was directly dependent ($r = +0.97$) on the volume of cellular free space, and was greatest in spring wheat and least in beans. This confirms the role of the free space in the regulation of water metabolism in plants, and thus the existence of a unified hydrostatic system.

IRON-RICH RHYTHMICALLY LAMINATED SEDIMENTS IN LAKE OF THE CLOUDS, NORTHEASTERN MINNESOTA,
Minnesota Univ., Minneapolis. Limnological Research Center.
R. S. Anthony.
Limnology and Oceanography, Vol 22, No 1, p 45-54, January 1977. 6 fig, 4 tab, 21 ref. NSF GB-7163.

Descriptors: *Sediments, *Lakes, *Varves, *Minnesota, Surveys, On-site investigations, Laboratory tests, Chemical analysis, Chemicals, Iron, Iron oxides, Manganese, Core logging, Cores, Annual, Annual turnover, Limnology.
Identifiers: *Laminated sediments, *Lake in the Clouds(Minn).

Sediments from the deepest part of Lake of the Clouds (31 m) are rhythmically laminated throughout all but the basal part of the column. The laminations can be correlated with events in the lake during the annual cycle. Ferrous iron (maximum 620 ppm) accumulates in a layer of water about 2 m thick in the deepest part of the lake. The laminations form in the sediments only where overlain by this stagnat iron-rich water. The light-colored portion of the couplet presumably forms from iron oxides precipitated from partially oxygenated bottom water during fall and spring overturns, and the dark layer seems to form from organic remains that settle out during summer. Chemical analysis and electron-microprobe studies revealed a much higher concentration of iron and manganese in the light layers than in the dark. Vivianite and probably limonite occur extensively in nodules throughout the core. Siderite was identified by X-ray diffraction. Numerous orange spherical aggregates occur in the light layers. An iron and manganese profile of the sediment column suggests that the most distinct laminae are found where the iron content of the sediment is at least 4%. (Sims-ISWS)

CHARACTERISTICS OF WATER FLOW AT THE NORTH END OF THE WASSAW BARRIER ISLAND COMPLEX. WASSAW ISLAND EROSION STUDY, PART II,
Georgia Marine Science Center, Savannah.
G. F. Oertel.
Georgia Marine Science Center Sea Grant Technical Report Series No. 77-2, (1977) 14 p, 7 fig, 3 ref. SG-04-5-158-4.

Descriptors: *Inlets(Waterways), *Sediment transport, *Erosion, *Sedimentation, Georgia, Barrier islands, Ocean currents, Water transfer.
Identifiers: Water currents, Sea Grant Program.

This report supplements an earlier report on the 'Sedimentary framework of a channel margin shoal of an ebb delta, Wassaw Sound, Georgia'. The purpose of this report is to produce an overview of water currents that may affect the sediment carpet described in the earlier report. Water flow recorded at four different stations around the marginal shoal. At each station, data was recorded for two tidal cycles (approximately 25 hours) at six minute intervals. In all, approximately 2,000 data points were collected.

CHANGING NEEDS AND OPPORTUNITIES IN THE SEDIMENT FIELD,
Geological Survey, Baltimore, Md. Water Resources Div.
M. G. Wolman.
Water Resources Research, Vol 13, No 1, p 50-54, February 1977. 21 ref.

Descriptors: *Sedimentation, *Erosion, *Sediment transport, *Sediment yield, Reviews, Evaluation, Model studies, Hydrologic properties, Hydrologic data, Environmental effects.

Information on the processes of erosion and sedimentation, while sometimes sufficient for gross estimates of yield, remains inadequate for modern environmental management. Little is known about sequential processes involved in the systems of erosion and sedimentation, and practice and theory require attention to unsteady or discontinuous erosion and transportation as sediments move from source through channel systems with intermittent periods of storage. While climatic and hydrologic variations markedly affect yield, transport and deposition thresholds of erosion of cohesive materials and sequences of such effects remain unclear. The highly variable temporal and spatial character of erosion and sedimentation processes must be emphasized in the predictive exercise of environmental impact assessment. Validation or testing of the predictive capacity of our current knowldge can only be achieved by field observation. This does not imply massive data collection programs but rather an integration of model building, laboratory study, and continuity of study in carefully selected field areas. (Woodard-USGS)

HYDROCHEMISTRY OF THE LAKE MAGADI BASIN, KENYA,
Geological Survey, Reston, Va. Water Resources Div.
B. F. Jones, H. P. Eugster, and S. L. Rettig.
Geochimica et Cosmochimica Acta, Vol 41, p 53-72, 1977. 7 fig, 4 tab, 24 ref.

Descriptors: *Water chemistry, *Lakes, *Brines, *Inflow, *Africa, Surface-groundwater relationships, Sampling, Boreholes, Evaporation, Alkaline water, Adsorption, Chemical precipitation, Salts, Springs, Chemical reactions, Pollutant identification.
Identifiers: *Kenya(Rift Valley), *Lake Magadi basin(Kenya).

Water samples from the Lake Magadi area, Kenya, range from dilute inflow (<0.1 g/kg dissolved solids) to very concentrated brines (>300 g/kg dissolved solids). Five distinct hydrologic stages can be recognized in the evolution of the water compositions: dilute streamflow, dilute ground water, saline ground water (or hot spring reservoir), saturated brines, and residual brines. Based on the assumption that chlorode is conserved in the waters during evaporative concentration, these stages are related to each other by the concentration factors of about 1:28:870:7600:16,800. Budget calculations show that only bromide is conserved as completely as chloride. Sodium follows chloride closely until trona precipitation, whereas silica and sulfate are largely lost during the very first concentration step (dilute streamflow-dilute ground water). Seasonal runoff, principally from the valley floor north of Lake Magadi, is the principal recharge to the Magadi ground water system. Evaporative concentration is the overall process responsible for the chemical evolution of the brines. Data were obtained for borehole brines from as deep as 297 m. They show the existence of two distinct brine bodies below the present lake, one shallow, coexistent with bedded salts, and highly concentrated (260 g/kg average dissolved solids), and the other deeper in lacustrine sediments or fractured lavas, and only half as concentrated. (Woodard-USGS)

A STUDY TO FORECAST THE WAVES AT DIGHA,
River Research Inst., Calcutta (India).
S. K. Das Kaviraj, and S. K. Sarkar.
Indian Journal of Meteorology, Hydrology and Geophysics, Vol. 27, No. 2, p 177-184, April 1976. 5 fig, 3 tab, 9 ref, 1 append.

Descriptors: *Waves(Water), *Ocean waves, *Winds, Coasts, Wind tides, Shore protection, Shores, Foreign countries, Foreign research, Measurement, On-site investigations, Model studies, Mathematical models, Frequency, Velocity, Height, Oceanography.
Identifiers: *India, *Digha(India).

Instrumental records of waves and wind speeds at Digha have been utilized to forecast wave characteristics, namely, the wave period and wave height. The spectrum of waves as devised by Neumann, has been used to establish an empirical relationship between the wind speed and the period of maximum wave height, also this has been used to derive a relationship between the wind speed and the optimum value of wave frequency. Co-cumulative power spectra have been to study the distribution of energy, and the significant range of periods of the sea waves at different wind speeds. From the observed records, values of maximum wave heights at corresponding wind speeds were determined. An empirical relationship between the maximum wave height in deep sea, and the speed of the generating wind is established. Significant wave heights at corresponding wind speeds were also calculated, and a formula relating significant wave height to the wind speed was provided. (Sims-ISWS)

NILE CONE: LATE QUATERNARY STRATIGRAPHY AND SEDIMENT DISPERSAL,
Smithsonian Institution, Washington, D. C. Div. of Sedimentology.
D. J. Stanley, and A. Maldonado.
Nature, Vol. 266, No. 5598, p 129-135, March 10, 1977. 4 fig, 1 tab, 37 ref.

Descriptors: *Sedimentation, *Quaternary period, *Stratigraphy, Sediments, Deposition(Sediments), Cores, Core logging, Stratification, Carbon radioisotopes, Dams, Rivers, Deltas, Sedimentology.
Identifiers: *Mediterranean Sea, *Nile River, *Aswan Dam, *Nile Cone.

The cyclic nature of Late Quaternary Nile Cone sediments is a response to major climate oscillations, including marked changes in sea level, Nile river discharge and sediment influx, and water mass stratification. Deposits have accumulated most rapidly northwest of the Nile Rosetta Branch since the Early Wurm. A broad area of low sedimentation on the Cone, initiated during the Holocene sea level rise, is predicted to increase in size as a result of the Aswan High Dam and modification of Nile River flow. (Sims-ISWS)

EXCHANGE THROUGH A BARRIER ISLAND INLET: ADDITIONAL EVIDENCE OF UPWELLING OFF THE NORTHEAST COAST OF NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Geosciences; and North Carolina State Univ., Raleigh. Center for Marine and Coastal Studies.
C. E. Knowles, and J. J. Singer.
Journal of Physical Oceanography, Vol. 7, No. 1, p 146-152, January 1977. 7 fig, 1 tab, 10 ref. NOAA 04-3-158-40.

Descriptors: *Upwelling, *Temperature, *Barrier islands, *North Carolina, Coastal engineering, Hydrographs, Salinity, Water temperature, Tidal effects, Wind tides, Current meters, Continental shelf, Inlets(Waterways).
Identifiers: *Oregon Inlet(NC), Tidal periodicity, Tidal fluctuations, Thermographs, Current velocity, Time-history record.

Hydrographic data were collected at Oregon Inlet, North Carolina, during the period June 20-July 2, 1973. Examination of the water temperature time-history record at three stations in and near the inlet showed: (1) that in 2 periods with predominately southerly winds, the temperature fluctuated in the range from 13.7 to 27.5 C, with an apparent tidal periodicity; (2) that for nearly 48 hours between these 2 periods and with northeasterly winds, a nearly constant temperature of 22.0 to 22.5 C was maintained in spite of normal tidal fluctuations; and (3) that this constant temperature period was bracketed by two 25 hour transitional periods that were initiated almost coincidently with wind directional changes. It appears that the sequence and relationship of these wind and water temperature data could be explained by (as well as provide additional evidence and documentation of) wind-induced upwelling along the northeastern North Carolina coast. An important conclusion drawn from this sequence and relationship of data was that temperature, salinity, and current velocity records in and near a barrier island inlet could furnish much information about the exchange and mixing processes on the adjacent continental shelf, especially when there are large differences in temperature and salinity between the sound and shelf waters. Descriptors: *Wind erosion, *Analytical techniques, *Aeolian soils, Equations, Winds, Velocity, Profiles, Sands, Movement, Weather data, Deserts, Coasts, Dunes, Erosion.

Extensive wind profile measurements were made over beaches, tidal flats, and small dune fields in Barbados, Ecuador, Florida, Texas, and on Alaskan Arctic coasts during the past several years. The linear relationship between shear and wind velocities was verified by these measurements, in conjunction with Bagnold's data (1941) from experiments in a Libyan desert. From the measurements, a simple method was developed for computing eolian transport of the most common sand particle sizes which occur on coasts and deserts by using routinely available wind observations from nearby weather stations. Descriptors: *Sands, *Mississippi River, *Chemistry, Louisiana, *Cements, Beaches, Barrier islands, Coasts, Carbon, Methane, Carbonates, Sediments, Chemical analysis, Analytical techniques, Sampling.
Identifiers: *Mississippi Delta, *Chandeleur Islands(La), Cementation, Beach sands, Carbonate cements.

Highly negative delta C13 values, -18 to -40 parts per thousand, for carbonate cements found in Recent barrier and beach sands of the Mississippi River Delta complex strongly suggest that considerable carbon is furnished to the CaCO3 cements by either chemical or biological oxidation of CH4. These cemented sands are commonly found on beaches of the Chandeleur barrier island chain and other sites along the Louisiana coast where Holocene sands are rapidly transgressing over highly organic marsh deposits. Generation of CH4 from underlying anoxic marsh sediment, followed by vertical migration and oxidation to CO2 in the porous overlying sand, appears to be the unique set of conditions regulating this process of carbonate cementation. A SELF-CONTAINED FACILITY FOR ANALYZING NEAR-BOTTOM FLOW AND ASSOCIATED SEDIMENT TRANSPORT,
Chicago Univ., Ill. Dept. of the Geophysical Sciences.
B. Lesht, R. V. White, and R. L. Miller.
NOAA Technical Memorandum ERL MESA-9, October 1976. 41 p., 11 fig, 1 tab, 11 ref, 4 photos.

Descriptors: *Sediment transport, New York, Flow characteristics, Facilities, Oceanographic equipment, Instrumentation.
Identifiers: Ocean floor, *New York Bight.

The field system described in this report was designed to monitor several aspects of the near bottom environment. The system can measure and record horizontal velocities at several levels within one meter of the ocean floor. Simultaneous measurements of wave pressure, mean current direction and turbidity can also be recorded. The recorded information is stored in digital format facilitating later analysis. The system is relatively inexpensive, flexible, and can be easily transported by small truck to the field location. Several experiments have been conducted with success in the New York Bight between May 1974 and October 1975. These are summarized. Field operations are illustrated by a series of photographs. Preliminary analysis indicates that in the shallower experimental areas surface wave activity may have a significant effect on the flow field near the bottom even in slight seas. (NOAA)

A TEST PARTICLE DISPERSION STUDY IN MASSACHUSETTS BAY.
National Oceanic and Atmospheric Administration, Boulder, Colo. Marine Ecosystems Analysis Program Office.
NOAA Technical Report ERL 374-MESA 6, September 1976. 52 p, 13 fig, 2 tab, 10 ref, 10 append. Edited by R. H. Wing, Pacific Marine Environmental Laboratory, Seattle, Wash. NOAA-TR-ERL 374-MESA 6.

Descriptors: *Massachusetts, *Dispersion, *Sediment transport, *Meteorological data, *Resources development, *Baseline studies, Bays, *Mathematical models, *Forecasting.
Identifiers: *Oceanographic data, Particle dispersion, *Massachusetts Bay.

The goal of this study was to develop a predictive model to estimate, in advance of dredging operations, where the fines of a dredge plume would travel. On June 11, 1973, 2700 kg (3 tons) of small particles were released into the water column in Massachusetts Bay. Their movement was tracked for 10 days. Also, oceanographic data were collected and analyzed and a dispersion model was formulated. Final data show the plume movement to be westward toward Boston Harbor, eastward toward Stellwagen Bank and southward along the coast into Cape Cod Bay where a counterclockwise gyre is suggested. (NOAA)

INVESTIGATION OF FLUSHING TIME IN THE LAFAYETTE RIVER, NORFOLK, VIRGINIA,
Old Dominion Univ., Norfolk, Va. Dept. of Civil Engineering.
C. H. Blair, J. H. Cox, and C. Y. Kuo.
Technical Report No. 76-C4, December 1976. 60 p, 22 fig, 6 tab, 16 ref.

Descriptors: *Virginia, *Estuaries, *Dyes, *Tracers, Monitoring, Water pollution, Path of pollutants.
Identifiers: *Flushing, Lafayette River estuary(Va).

Two consecutive dye tracer experiments were conducted in the Lafayette River during the period July 14 to August 29, 1976 in order to determine the flushing time of the estuary. Slug released of Rhodamine WT fluorescent dye in the north branch (km 8) and at the mouth of the main branch (k, 1.5) produced concentration fields which were periodically monitored. Additional parameters measured during these experiments included rainfall, salinity, and tidal height. Dye mass and center of dye mass in the estuary were determined. After tracer release at km 8 in dry summer conditions maximum dye concentration dropped 50% in about one day; about 1.5 days were required to flush 50% of the dye mass out of the north branch, while 9.5 days were required to flush a similar amount out of the mouth of the Lafayette River. When release occurred at km 1.5, about four days were required for maximum concentration to drop by 50%, while 5.5 days were required to flush 50% of the dye mass from the estuary. (NOAA)
W77-06881

LITTORAL DRIFT ESTIMATES ALONG THE COASTLINE OF FLORIDA,
Florida Univ., Gainesville. Coastal and Oceanographic Engineering Lab.
T. L. Walton, Jr.
Sea Grant Report No. 13, August, 1976. 128 p, 13 fig, 17 ref, 3 append.

Descriptors: *Sediment transport, *Florida, *Littoral drift, *Data collections, Coasts, Erosion, Beaches, Engineers estimates, Design data.

Littoral drift roses are computed on a monthly averaged basis for possible use in feeder beach design and groin system design where a knowledge of seasonal sand movement is important, and in design of jetties where a knowledge of the monthly buildup of sand adjacent to the structure is of beneficial use in planning the construction phase of a project. The more important aspects of the data source and the computational results with a geomorphological interpretation of a section of coastline using the results. Additionally, heuristic comparisons of monthly littoral drift rates are presented where such comparisons can be made and a summary of the results of this study with implications for use of the data is given. Additionally, along with the monthly littoral drift roses, the annually averaged littoral drift roses have been included with new scales superimposed for ease of interpolating results. (NOAA)

CONTINENTAL SHELF WAVES AND ALONGSHORE VARIATIONS IN BOTTOM TOPOGRAPHY AND COASTLINE,
Oregon State Univ., Corvallis, School of Oceanography.
J. S. Allen.
Journal of Physical Oceanography, Vol. 6, No. 6, p 864-878, November 1976. 5 fig, 1 tab, 21 ref, 1 append. NSF DES75-15202, IDO 71-04211, OCE76-00596.

Descriptors: *Ocean waves, *Continental shelf, *Coasts, Waves(Water), Topography, Model studies, Mathematical models, Oceans, Shores, Equations, Continental slope, Winds, Oceanography.

The effects of alongshore variations in bottom topography and coastline on the wind-stress-forced barotropic motion over a continental shelf and slope were studied. Perturbation methods were used to obtain solutions for forced and free continental shelf waves on an idealized continental shelf and slope with small-amplitude alongshore variations in topography. The relevant alongshore scales, set by the wind stress and by the bottom and coastline topography, were assumed to be greater than the shelf-slope width. This enables the resulting motion to be treated in the long-wave nondispersive limit. As a result, the alongshore and time-dependent behavior of the perturbation flow is governed by a forced, first order wave equation, with terms from the interaction of the basic, lowest order flow with the bottom and coastline topography acting as the forcing function. To clarify the effects of topography alone, problems were considered where a uniform wind stress forces a basic unperturbed flow which is independent of the alongshore coordinate. In one example, a steady, alongshore-independent basic flow was established impulsively by a delta function application of the wind stress. The perturbation flow adjusts to the alongshore variations in topography through the propagation of disturbances as free continental shelf waves. There is an eventual establishment in the region of variable topography of a steady-state motion which follows contours of constant depth. (Sims-ISWS)

AN ANALYSIS OF INERTIAL OSCILLATIONS OBSERVED NEAR OREGON COAST,
Oregon State Univ., Corvallis. School of Oceanography.
P. K. Kundu.
Journal of Physical Oceanography, Vol. 6, No. 6, p 879-893, November 1976. 13 fig, 2 tab, 37 ref. NSF IDO 71-04211, OCE76-00596.

Descriptors: *Ocean currents, *Internal waves, *Continental shelf, *Oregon, *Pacific Ocean, On-site investigations, Model studies, Mathematical models, Waves(Water), Coasts, Currents(Water), Current meters, Measurement, Analytical echniques, Data processing, Oceans, Oceanography.
Identifiers: *Inertial oscillations.

Nearly two months of current meter data taken during the summer of 1973 at eleven depths at a station off the coast of Oregon in 100 m of water were analyzed. The spectra showed an 8% increase in the frequency of the inertial peak (omega about = 0.064 cph) above the local f (= 0.59 cph). Because of the proximity of the tidal frequencies to the local f, a sharp bandpass filter centered at omega = 0.064 cph was used to isolate the inertial motions. The results showed that the amplitude of the inertial oscillations decayed slowly with depth, but the decay within about 10 m of the bottom was more rapid. A lagged correlation of the inertial currents clearly showed an upward propagation of phases throughout the water column at a speed of about 0.1 cm/s within the depth range 20-60 m. The inertial currents were found to turn clockwise (looking down) with depth, which corresponds to an upward phase and downward energy propagation; and the vertical phase speeds implied by the rates of turning agreed remarkably well with the lagged correlation calculations. The vertical wavelength was found to be of the order of the water depth. The vertical flux of energy into the bottom boundary layer during the occurrence of inertial bursts was estimated to be of the same order as the rate of turbulence production within the boundary layer, signifying that the inertial bursts can cause appreciable boundary layer stirring. (Sims-ISWS)
W77-06892

CIRCULATION AND HYDROGRAPHIC STRUCTURE OVER THE GHANA CONTINENTAL SHELF DURING THE 1974 UPWELLING,
Ghana Univ., Accra. Dept. of Physics.
R. W. Houghton.
Journal of Physical Oceanography, Vol. 6, No. 6, p 909-924, November 1976. 18 fig, 2 tab, 25 ref.

Descriptors: *Upwelling, *Continental shelf, *Atlantic Ocean, *Africa, Currents(Water), Ocean currents, Winds, Temperature, Water temperature, Salinity, Foreign countries, Current meters, Data processing, On-site investigations, Circulation, Ocean circulation, Coasts, Oceans, Hydrography, Oceanography.
Identifiers: *Ghana.

The changes in the circulation and hydrographic structure over the continental shelf south of Tema, Ghana, during the 1974 upwelling were described. For the first time in this region, an Aanderaa current meter mooring provided a continuous record of currents at three levels. During the onset of the upwelling, there was evidence of a vertical flow of 0.00008 m/s and an offshore flow at the surface of 0.07 m/s. A large vertical shear, which is a permanent feature throughout most of the year, vanished during the upwelling. Sea level changes were predominantly steric in origin. The upwelling event and the subsequent changes in the hydrography and circulation do not correlate with changes in the coastal wind. There were important differences between Ghana regime and that observed in other coastal upwelling areas. No simple driving mechanism was apparent. As a result, existing theoretical models may not be applicable. The possibility that waves of oceanic origin play an important role in the evolution of the coastal hydrography was discussed. (Sims-ISWS)

THE INFLUENCE OF WIND ON THE SURFACE LAYER OF A STRATIFIED INLET: PART I. OBSERVATIONS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
D. M. Farmer, and T. R. Osborn.
Journal of Physical Oceanography, Vol. 6, No. 6, p 931-940, November 1976. 10 fig, 1 tab, 12 ref.

Descriptors: *Inlets(Waterways), *Estuaries, *Canada, *On-site investigations, Flow, Salinity, Winds, Instrumentation, Current meters, Data processing, Analytical techniques, Saline water-freshwater interfaces, Circulation, Water circulation, Currents(Water), Coasts, Oceanography.
Identifiers: *Alberni Inlet(British Columbia), British Columbia, *Vancouver Island.

Observations were reported of an experiment undertaken to determine the response of a stratified inlet to changing conditions of wind, tide, and runoff. Time series of conductivity profiles taken in Alberni Inlet, British Columbia, showed marked fluctuations in surface layer thickness that appear to be related to strong winds. The effect of an upinlet wind is to produce a rapid thickening of the freshwater layer at the inlet head which may persist for several days. Strong winds were also associated with significant changes in the intensity of stratification. (See also W77-06895) (Sims-ISWS)
W77-06894

THE INFLUENCE OF WIND ON THE SURFACE LAYER OF A STRATIFIED INLET: PART II. ANALYSIS,
British Columbia Univ., Vancouver. Inst. of Oceanography.
D. M. Farmer.
Journal of Physical Oceanography, Vol. 6, No. 6, p 941-952, November 1976. 13 fig, 1 tab, 6 ref, 1 append.

Descriptors: *Inlets(Waterways), *Estuaries, *Canada, *Data processing, Analytical techniques, Circulation, Water circulation, Winds, Tides, Diurnal, Model studies, Mathematical models, Saline water-freshwater interfaces, Currents(Water), On-site investigations, Oceanography.
Identifiers: *Alberni Inlet(British Columbia), *British Columbia, *Vancouver Island.

Analysis of the wind and current data for Alberni Inlet demonstrated the strongly wind-dependent nature of the surface currents, especially at the diurnal frequency. In contrast, the response of the surface layer thickness is mainly restricted to lower than diurnal frequencies. A linear two-layer model with allowance for friction was used to show that frictional damping can account for the poor coupling at high frequencies. In fact, the friction is sufficiently large to cause free modes to be critically damped (i.e., non-oscillatory). The model results compared favorably with the observations, using a frictional coefficient estimated from the decay of the internal tide. (See also W77-06894) (Sims-ISWS)
W77-06895

OBSERVATIONS OF WIND-GENERATED WAVES ON VARIABLE CURRENT,
National Aeronautics and Space Administration, Wallops Island, Va. Wallops Flight Center.
S. R. Long, and N. E. Huang.
Journal of Physical Oceanography, Vol. 6, No. 6, p 962-968, November 1976. 10 fig, 1 tab, 18 ref. NASA NAS6-2617.

Descriptors: *Waves(Water), *Winds, *Model studies, Hydraulic models, Currents(Water), Laboratory tests, Data processing, Analytical techniques, Ocean currents, Oceans, Oceanography.
Identifiers: *Wind-generated waves.

Laboratory measurements utilizing a laser probe were made for the slopes of wind waves generated on both positive and negative currents at different values of fetch. The data were then processed electronically to yield an average wave-slope spectrum in frequency space with 128 degrees of freedom. These spectra were used to obtain the growth of the spectral components at various frequency bands for increasing wind and different values of fetch and current. The results indicated that the growth of the spectral components is not monotonic with the frictional wind speed U sub *, but, rather, exhibits an 'overshoot' phenomena at lower values of U sub *. In addition, the growth of the spectral components displays a significant effect due to current. The peak location and spectral intensity of the spectra also show strong influence by the current condition, resulting in the rms surface slope value increasing with negative current and decreasing with positive current. The results agreed qualitatively with some theoretical predictions. The potential use of the current-induced effects as a means for remote sensing of ocean current was also briefly discussed. (Sims-ISWS)

EVIDENCE FOR STRONG CURRENTS AND TURBULENCE IN A DEEP CORAL REEF GROOVE,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
H. H. Roberts, S. P. Murray, and J. N. Suhayda.
Limnology and Oceanography, Vol 22, No 1, p 152-156, January 1977. 3 fig, 16 ref.

Descriptors: *Currents(Water), *Turbulence, *Coral, *Reefs, Sea water, Dyes, Islands, Diffusion, Turbulent flow, Mathematical studies, Photography.
Identifiers: *Diffusion coefficient, *Coral reef groove, Ambient current, Reef roughness elements, Coral heads, Island shelves, Sea floor, Coral-covered spurs.

High levels of turbulence (turbulence intensity approximately equals 23 cm/ss, diffusion coefficient approximately equals 2.4 x 1000 sq cm/s) and strong currents (approximately equals 35 cm/s) were found in a deep coral reef groove (approximately equals 33 m). This unexpected turbulence probably is related to the ambient current acting on reef roughness elements, e.g., coral heads. Well-developed coral communities that commonly occur at the deep margins of island shelves may be, in part, associated with these unusual levels of turbulent diffusion. (Roberts-ISWS)

EFFECT OF THE NILE FLOOD ON THE ESTUARINE AND COASTAL CIRCULATION PATTERN ALONG THE MEDITERRANEAN EGYPTIAN COAST,
Alexandria Univ. (Egypt). Dept. of Oceanography.
S. H. Sharaf El Din.
Hydrological Sciences Bulletin, Vol 21, No 3, p 451-461, September 1976. 8 fig, 11 ref.

Descriptors: *Flooding, *Currents(Water), *Effects, *Circulation, Discharge(Water), Flood data, Dams, Flood flow, Temperature, Coastal engineering, Marine geology, Hydrographs, Estuaries, Sea water, Estuarine environment, Foreign countries.
Identifiers: *Aswan High Dam, *Nile River, *Egypt, *Mediterranean Sea, *Port Said, Offshore region, Temperature-salinity diagrams, Flood effects.

Before 1964, 60-180 million tons of sediments and 16 X 10 to the 9th power to 64 X 10 to the 9th power cu m of water were transported yearly to the Mediterranean Sea by the Nile. During the flood period, before the erection of the High Dam, the estuarine circulation pattern was a two-layered flow at the mouths of the two estuaries. In winter, the area was filled with sea water. The latter condition became persistent during most of the year after 1964. The effects of the Nile flood on the water masses before and after 1964 were shown on temperature-salinity diagrams. The velocities of the currents at the mouths of the branches of the River Nile reached more than four knots at the surface and less than half a knot at the bottom during the flood period before 1964. After 1964, this velocity dropped considerably. Hydrographic surveys before and after the closure of the High Dam indicated that the general oceanographic conditions in the offshore region did not change notably. The only difference between the pre-1964 and post-1964 conditions is that after 1964, no sediment was discharged from the Nile. This produced an imbalance in the near-coast sediment budget, with possible increased erosion along the shore. (Roberts-ISWS)

IN SITU ACOUSTIC MEASUREMENTS OF MICROBUBBLES AT SEA,
Naval Postgraduate School, Monterey, Calif. Dept. of Physics and Chemistry.
H. Medwin.
Journal of Geophysical Research, Vol. 82, No. 6, p 971-976, February 20, 1977. 7 fig, 11 ref.

Descriptors: *Oceans, *California, *Bubbles, *On-site investigations, Measurement, Surveys, Instrumentation, Hydrophones, Acoustics, Winds, Marine biology, Oceanography.
Identifiers: *Monterey Bay(Calif), Microbubbles.

Excess acoustic attenuations in the frequency range 5-160 kHz were used to deduce densities of bubbles of radius of 15-300 micron at depths of 3-36 m in water up to 1 km deep. The measurements were made over an acoustic path 1-5 m long. Correlations have shown dependence on season, sundown and sunrise, wind, and presence or absence of sea slicks and windrows. These inferred microbubbles are evidently of biological as well as physical origin. (Sims-ISWS)

INCIPIENT SEDIMENT MOTION IN ENTRANCES WITH SHELL BEDS,
Florida Univ., Gainesville. Dept. of Civil Engineering; and Florida Univ., Gainesville. Coastal and Oceanographic Engineering Lab.
A. J. Mehta, and B. A. Christensen.
Reprinted from: Proceedings of ASCE Symposium on Inland Waters for Navigation, Flood Control and Water Diversions, Colorado State University, August 10-12, 1976. p 960-977, 10 fig, 4 tab, 9 ref.

Descriptors: *Estuaries, *Coasts, *Sediment transport, Water resources, *Florida, Rivers, Sands, Stochastic processes, Shear stress, Gulf of Mexico.
Identifiers: Coastal zone, Shell beds, Stochastic models, Johns Pass(Fla), Blind Pass(Fla).

River and estuarine entrances are important components in reference to their contribution to the sand budget of the coastal zone. To test a stochastic model which predicts the critical bed shear stress for the incipient motion of coarse sediment grains at the point of bed erosion, given the grainsize and bed characteristics, data were obtained at two entrances - John's Pass and Blind Pass, on the Gulf Coast of Florida. The channel beds at these passes are laden with shells, and the transport of fine sand occurs over the shell bed. Results from the analysed data failed to agree with the well-known entrainment function relationshp of Shields for horizontal beds with uniform grains, but compared very well with the entrainment function derived from the stochastic model. It is noted that the discrepancy with Shields' relationship is due to the non-uniformity of the shell bed and the relatively large ratio of the equivalent sand roughness of the shell bed to the median sand grain diameter. The USSR has a large investment in weather modification research and operations. Major cloud physics experimental facilities exist at the Institute of Experimental Meteorology and at the Institute of Geophysics of the Georgian Academy of Sciences. Hail suppression operations are being carried out over about 5,000,000 ha of farmland. Although claims of success in these activities are more modest than they were in 1969, it is still reported that the benefits far exceed the costs. There is relatively little research and, at this time, apparently only one small-scale operational program dealing with precipitation augmentation. Research in the Ukraine over the last three years has led scientists there to conclude that ice nuclei seeding of cumulonimbus clouds, over a substantial area, caused rainfall increases of about 30%. It also was reported that snow from frontal clouds was increased. (Sims-ISWS)

ON THE STATUS OF HAIL SUPPRESSION,
Illinois State Water Survey, Urbana.
S. A. Changnon, Jr.
Bulletin of the American Meteorological Society, Vol. 58, No. 1, p 20-28, January 1977. 4 tab, 37 ref, 1 append. NSF ERP75-09980.

Descriptors: *Weather modification, *Cloud seeding, *Hail, Reviews, Silver iodide, Nucleation, Storms, Convection, Thunderstorms, Economics, Social impact, Surveys, Evaluation, Projects, Agriculture, Meteorology.
Identifiers: *Hail suppression, Opinion surveys.

A technology assessment of the future potential of hail suppression and all its possible ramifications in the United States in future years has included an attempt to define the current status of hail suppression. Hail suppression is at a stage in which the socioeconomic impacts of its use and the means to optimize its future utilization can be adequately treated. The estimation of a wide range of future suppression capabilities was based on the current status, which was defined after three sources of information: (1) results from preliminary evaluations of six recent projects, (2) findings on four published assessments of weather modification, and (3) results from two opinion surveys. This investigation indicates: (1) scientific beliefs about existing capabilities are widely different, with the majority of experts believing there is no capability; (2) the published reviews are optimistic but largely nondefinitive; and (3) the results of five of six recent suppression projects show suppression levels of 20-50%, but the results are largely not significant at the 5% level. This difference between average beliefs of experts and the results of recent projects suggests the need for an extensive investigation of the data and results of these recent projects. (Sims-ISWS)

COMPRESSED AIR FOR SUPERCOOLED FOG DISPERSAL,
Air Force Cambridge Research Labs., L. G. Hanscom Field, Mass. Meteorology Lab.
A. I. Weinstein, and J. R. Hicks.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A019 409, Price codes: A03 in paper copy, A01 in microfiche. Report AFCRL-TR-75-0561, October 22, 1975. 32 p, 10 fig, 4 tab, 13 ref.

Descriptors: *Fog, *Airports, *Weather modification, Laboratory tests, On-site investigations, Cloud seeding, Crystals, Ice, Equipment, Evaluation, Measurement, Meteorology.
Identifiers: *Fog dispersal, Compressed air, Ice crystals, Supercooled fog, Airport runways.

Series of controlled and free environment tests were conducted to determine the technical feasibility of using the cooling resulting from the adiabatic expansion of compressed air to initiate ice crystal production in a supercooled fog. It was found that approximately 1000 cu cm of air, when compressed to 60 psig and released through a supersonic nozzle, will produce the same number of ice crystals as does the evaporation of 1 cu cm of liquid propane. an analysis was made of the Air Force locations in the U.S. and Europe where supercooled fog can be expected to most seriously restrict runway operations. The bases where such restrictions can be expected to be most acute are Elmendorf AFB, Fairchild AFB, Hahn AFB, Zweibrucken AB, and K.I. Sawyer AFB. The Air Force Air Weather Service is already conducting operational supercooled fog dispersal programs using liquid propane at the first three of these bases. Various methods of producing compressed air were described, and the operating cost advantage of using this technique in lieu of liquid propane was discussed. It is estimated that a compressed air system would consume approximately 1/17 as much fuel as would a system using liquid propane spray. In an average year, the estimated savings at Elmendorf AFB is projected to be over 34,000 gallons (129,000 liters) costing over $16,000. (Sims-ISWS)

SOME SIGNIFICANT REGULARITIES IN PLANT HYDROADAPTATION, (IN RUSSIAN),
Yu. S. Grigor'ev.
Izv Sib Otd Akad Nauk SSR SER Biol Nauk 2, p 82-89, 1976.

Descriptors: *Adaptation, *Dehydration, *Moisture content, *Drought resistance, *Drought tolerance, Xerophytes, Plant physiology, Water storage, Water conservation.
Identifiers: Hydroadaptation, Hydrophyllization, Poikilohydrous plants, Homoiohydrous plants, U.S.S.R.

Two types or pathways of plant adaptation against desiccation on land exist. The passive type is peculiar to poikilohydrous plants (mainly lower plants) which do not regulate their water content and can tolerate more or less prolonged desiccation. The active type of adaptation is specific to higher plants. The latter are homoiohydrous possessing a complex of hydroregulating adaptations and capable of conserving water in tissues under desiccation. Two trends within the hydroadaptive rearrangement of land homoiohydrous plants exist: xerophyllization and hydrophyllization. During the xerophyllization process there is a strong hydroregulation adaptations.--Copyright 1976, Biological Abstracts, Inc.

SALINITY EFFECTS ON RICE AFTER THE BOOT STAGE,
Agricultural Research Service, Brawley, Calif. Imperial Valley Conservation Research Center.
M. T. Kaddah, W. F. Lehman, B. D. Meek, and F. E. Robinson.
Agronomy Journal, Vol. 67, No. 3, p 436-439, May-June 1975. 1 fig, 1 tab, 17 ref.

Descriptors: *Rice, *Salinity, *Crop response, *Salt tolerance, Flood irrigation, Crop production.
Identifiers: *Rice paddy.

Effect of salinity on rice after the boot stage has been controversial in the literature. Some authors maintain that rice is sensitive to salt at flowering, whereas others have found no evidence to support these views. The present greenhouse study evaluates the interaction after the boot stage of salinity, soil texture, and rate of drainage on rice development. Soil and plant analyses showed that: (a)

Average salinities in the root zone were 2 to 4 times the salinities of the respective irrigation waters. In general, salinities increased with plant development and with decreasing rate of drainage. Salt components added to Colorado river water increased in both straw and grain without effect on yield. (b) Mature grain yield of S1 and S2 did not differ significantly; average grain yield of S3 and 84% of S1. More reduction in yield would be expected if rice was sensitive to salt after the boot stage. (Skogerboe-Color St)

Identifiers: *Geothermal brines, *Mineral content, *Geothermal waters, *Mineral extraction, *Mineral quality, *Western United States, Metallurgy, Geothermal resources, Chemical composition, Geothermal wells, Dissolved mineral content, Mineral concentration, Hot springs.

Interest is being focused on geothermal resources for their potential with regard to alleviating water and power demands of the future. The possibility of extracting minerals from geothermal brines is attractive and could lead to reduced costs for development of the overall geothermal resource. However, analytical information on which to develop extraction processes is inadequate. The objective of this study is to determine concentrations of minerals in geothermal brines in order that mineral recovery systems can be formulated and evaluated. Sixty-six samples were collected from geothermal areas and each sample was analyzed for 34 to 39 individual constituents. Nearly 860 analyses from about 420 geothermal sources in the Western United States were incorporated into a computerized storage and retrieval system. These data can be selectively retrieved according to any specified combination of parameters in order to expedite calculations or other data handling required for development and evaluation of mineral recovery procedures. Descriptors: *Land forming, *Terracing, Groundwater recharge, Rainfall, Recharge, *Soil moisture, *Kansas, Wheat, Grain sorghum, Fallowing, Model studies, *Water utilization, Demonstration watersheds, Crop production, Watershed management, Monitoring, Agricultural watersheds, Potential water supply.
Identifiers: Fallow efficiency.

Two years of operation of conservation bench terraces and level pans at Garden City, Kansas conclusive as to determining increased water use efficiency for crop production. Precipitation in both years was well below normal and little surface runoff occurred. Measurements of precipitation, watershed runoff and soil moisture in the top 2.3 m were monitored and used to calibrate a soil moisture budget simulation model for western Kansas. The model was calibrated with one year's data from a fallow watershed. Predicted total soil moisture content in the 2.1 m soil profile averaged within 2.4 percent of actual field values. The model was then used to estimate the potential for ground water recharge from conservation bench terraces over the period 1945-1974.

THE SIGNIFICANCE OF REGULATING THE WATER REGIME OF AGRICULTURAL LANDS, (IN RUSSIAN),
E. P. Eihe.
Latv Psr Zinat Akad Vestis 7, p 3-8, 1975.

Descriptors: Control, *Water balance, *Cultivation, *Water requirements, *Soil moisture, *Crop production, Water resources, Management, Cultivated lands, Drainage effects, Perennial rye-grass, Corn(Field), Oats, Vetch, Water pollution, Irrigation practices, Sprinkler irrigation, Confined waters, *Regulation.
Identifiers: Latvian-SSR, U.S.S.R.

The problems and importance of maintaining an air-water balance in cultivated lands are discussed. A drainage network that fulfills only a drainage function cannot adequately supply crops with water during the period of maximum demand. In order to ensure high and resistant yields, bilateral regulation of the soil water regime is necessary. The significance of such measures for crop yields is illustrated by data on a perennial grass mixture, silage corn, an oat-vetch mixture with ryegrass and feed cabbage. The problems of limited water resources for irrigation in the Latvian SSR (USSR), intensified by water pollution and the inappropriateness (in terms of pH and temperature) of artesian well waters, are outlined. Surface water reservois, underground moistening of the root zone and increased soil moisture capacity should be developed. The advantages of deep (to 50-100 cm) plowing of drained lands, vertical drainage-based drying and moistening, and synchronous impulse sprinkler irrigation are also described.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Potassium, *Fertilizers, *Fertilization, Nutrients, Crop production, Cultivation, *Washington, Arid lands, Loam, Loess.

Two K fertilizer experiments were initiated in 1961 in arid central Washington on a Shano silt loam soil site that had been leveled to accommodate irrigation. The experiments were continued for 3 years and utilized rates of K fertilizer up to 320 kg K/ha in a randomized complete block design. By 1964 there existed a wide range of Kst (soil test K) as a result of the fixed random K treatments and partial exposure of K-deficient subsoils. That year the experiments were altered to completely randomized designs using both Kst and K fertilizer rates as controlled variables. The experiments were continued through 1970, providing an evaluation of the effects of crop management and K fertilization on soil K reserves. At low levels of Kst soil mineral K (Km) had a dominating influence, strongly buffering Kst changes involved with K removal (cropping) and K addition (fertilization). Whereas Kst serves as a good first approximation of soil K supply potential, supplemental information is required to fully describe the intensity and capacity factors in the K-soil-plant system. At comparable levels of Kst, the Shano silt loam profile is essentially homogeneous in regard to K availability. Therefore, special efforts to sample subsoils need not be made in routine fertility diagnosis of this soil series. (Skogerboe-Colo St)

Descriptors: *Comparative productivity, *Irrigation systems, *Irrigation effects, *Cotton, *Crop response, Crop production, Investigations, Surface irrigation, Subsurface irrigation, Sprinkler irrigation, Semiarid climates.
Identifiers: *Turkey.

Comparative investigations were carried out to test the underground irrigation vs. different surface irrigation methods under semiarid conditions of W Turkey. The underground irrigation water was applied by means of plastic drainage pipes laid out at 4 depths (0.8, 1.0, 1.2 and 1.4 m) below the soil surface and plastic foils were placed under the pipes to avoid infiltration losses. This irrigation method was compared with border and furrow irrigation with 50, 70 or 90 mm water/application. Sprinkler irrigation and a control treatment (non-irrigated) were included. The applied quantities of water amounted to 270-280 mm within the irrigation period from the beginning of July to the end of Aug. There were no significant differences between the border and furrow irrigation. Treatments with 90 mm of water per application were superior to the other treatments. The underground irrigation at the depth of 0.8 m was superior as compared to the other depths (1.0-1.201.4 m). Lowest yield was obtained with sprinkler irrigation. The control showed absolutely lowest yields. There were characteristic differences between surface and underground irrigation in regard to the development of the cotton plant and growth of the vegetative and generative organs. With underground irrigation at 0.8 m depth the branches and buds were formed earlier, and the highest number of bolls (closed and open) was reached at an earlier date as compared with surface irrigation (furrow 90 mm). The maximum leaf number was obtained with underground irrigation. The furrow irrigation at 90 mm showed the highest yield in all 4 rounds followed by the underground irrigation in the yield range. The seed:lint ratio was closer with underground irrigation in favor of lint yield. The advantages of the underground irrigation system result from the constant distribution of the applied water in the root zone. Underground irrigation which results in an earlier and faster development of cotton plants as compared with the other methods, offers advantages to the growth of cotton plants especially in ecological semiarid regions like W Turkey, where the vegetative time is limited by temperature (germination temperature of 15C at the beginning of May) in spring and by the start of the winter precipitation in autumn (Oct).--Copyright 1976, Biological Abstracts, Inc.

EVALUATION OF THE ENVIRONMENTAL IMPACT TO APPALACHIAN PENNSYLVANIA WATERS OF THE 1972 FLOOD AND SUBSEQUENT STREAM CHANNELIZATION WITH FUTURE POLICY RECOMMENDATIONS.
Baker (Michael), Jr., Inc., Beaver, Pa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 659, Price codes: A14 in paper copy, A01 in microfiche. Report ARC-73-185-2562, September 1975. 319 p, 74 fig, 29 tab, 45 ref, 6 append. ARC 73-185.

Descriptors: *Floods, *Channel improvement, *Ecology, *Pennsylvania, Watersheds(Basins), Hurricanes, Streams, Flood damage, Historic floods, Water quality, Effects, Fish, Freshwater fishes, Trout, Benthos, Algae, Mining, Hydrology, Biology.
Identifiers: *Hurricane Agnes, Pennsylvania streams.

Geologic, engineering, and biological investigations of six coldwater Pennsylvania streams were undertaken to determine the impact of Tropical Storm Agnes and both pre- and post-flood stream channelization. The primary focus of the study was the ecological changes brought about by channel modification. No long-term deleterious effects of stream channelization on water quality, attached algae, benthic fauna, or forage fish populations were found. Trout were found to be greater in numbers and weight in natural stream reaches than in channelized reaches. Destruction of habitat appears to be the primary cause. Stream channelization was found often to be performed with a lack of adequate planning and supervision. A comprehensive planning process, as well as other recommendations, was set forth. (Sims-ISWS)

Identifiers: *Harz Mountains(Federal Republic of Germany), Conjunctive operation, Release rules.

The conjunctive operation of reservoirs for better use of natural resources requires well adjusted plans for the individual reservoirs. The operation of single-storage reservoir systems in the Harz Mountains in northern Germany is investigated using a simulation procedure covering a period of 500 years. The technique is based on the Monte Carlo method. The storage model is based on the principle of queueing theory, and the storage volume is determined for each month according to a synthetic monthly inflow and a certain service function which is referred to as the release rule of the system. Synthetic values of monthly inflows are generated by the simulation, using the appropriate distribution function for the transformation of the random numbers generated in the interval (0,1). The synthetic monthly inflow is added to the storage volume at the end of the preceding month and the monthly outflow is determined by the release rule. It is concluded that the mode of operation is highly dependent upon the purpose of the reservoir determining the release rule and entails certain patterns of frequency distribution curves of monthly reservoir storage. OPTIMIZATION MODEL OF A SYSTEM OF TWO OPEN-CHANNEL HYDROPLANTS,
Gdansk Technical Univ. (Poland). Inst. of Hydraulic Engineering.
T. Biernacki, and T. Piwecki.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 908-914. 4 fig, 2 ref.

Descriptors: *Powerplants, *Optimization, *Open channels, *Efficiencies, Operations, Peak loads, Daily, Inflow, Time constraints, Economic efficiency, Computer models, Hydraulic models, Equations, Systems analysis.
Identifiers: *Hydroplants, Benefit maximization, Saint Venant equation, Load curve, System efficiency, Energy system cost, Energy cost function.

In an electrical grid system having power produced mainly by thermal plants, it seems that a small number of hydro-power plants by their nature should cover the peak of the load curve. However, this is not obvious when the system consists in part of a thermal plant now unable to meet peak demands and of low head hydroplants which are sensitive to the variation of head. Careful analysis is then required accounting for hydraulic phenomena and thereby guaranteeing the optimal usage of the hydroplants to meet the appropriate part of the daily load diagram. This paper presents a hydraulic, economic, computer optimization model for two (or more) hydro-power plants connected by an open channel without storage. The problem is stated as follows: locate the two hydropower plants in the load diagram so as to maximize the value of energy produced. Since the energy cost function illustrates the energy system costs resulting from participation of thermal power stations, the optimal time at which to operate the hydroplants is that giving the maximum value of energy produced by these hydroplants. Head losses and limited daily water inflow forces the hydroplants to cover different parts of the load diagram so as to optimize the operational cost. It is found that the computer model permits the energy output to be increased by several per cent, as compared with results obtained from hand computation. (See also W77-06708) (Bell-Cornell)

METHODS FOR CONTROL OF THE REGIMES FOR WATER RESOURCES SYSTEMS,
Moskovskii Energeticheskii Institut (USSR). Dept. of Hydropower.
A. Sh. Reznikovsky.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 915-918. 3 ref.

Descriptors: *Water resources, *Regulation, *Multiple purpose, Water storage, Behavior, Probability, Optimization, Equations, Mathematical models, Systems analysis, Reviews.
Identifiers: *Water systems, Hydroplants.

The definitions and characteristics of large multipurpose water systems are given in terms of system techniques. The basic problems and method for control of the regimes for water resources systems with water storage which are to regulate streamflow of different depths over the short seasonal and long-term period are considered. Special attention is given to the development of the hierarchy structure for control of the regimes for multi-purpose systems whose water storages have unequal regulating potentialities and time differences in water coming. Some problems on further development of water resource systems are posed. (See also W77-06708) (Bell-Cornell)

OPTIMAL COMPLEX USE OF CONTROLLED WATER RESOURCES OF A BASIN,
Akademiya Nauk SSSR, Moscow. Central Economic Mathematical Inst.
B. S. Verkhovskii.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 919-925. 3 ref.

Descriptors: *Water resources, *Control, *Lakes, *Water storage, *Markov processes, Regulation, Time, Effects, Optimization, Probability, Stochastic processes, Drainage, Volume, Constraints, Irrigation systems, Equations, Algorithms, Mathematical models, Operations research.
Identifiers: *Stochastic programming, Benefit maximization.

The paper presents a model for optimal complex use of the water resources of a basin with year-to-year regulation of drainage by lake storage. The optimized system is assumed to operate for an extended period. Since it operates in a stochastically varying environment, the optimum criterion is taken to be the maximum mathematical expectation of the total effect (e.g., of net income), accounting for the revaluation of the different time effects. Described is an algorithm for finding the uniform markovian control. Considered next is a different approach--not involving analysis of controlled stochastic process--which has particular application to the optimum use of water resources for irrigation. The approach, called stochastic programming, is quite efficient. (See also W77-06708) (Bell-Cornell)

Identifiers: *Syrdarya River(Middle Asia), Simultaneous operation, Water volume.

Extensive water resources systems providing water for vast areas and different users are becoming so complex that their effective control is possible only by the use of the newest cybernetic methods. Mathematical methods, used in combination with streamflow forecasting, are the most effective tools for obtaining optimal control rules. Use of these methods for the Syrsarya River basin, which is subject to various constraints, both natural and those of water demand, enables water resources to be used effectively. Presented is a complicated system of algorithms worked out for the purpose of water resources management to be used for the simulation of water systems under longterm planning and design. The mathematical model covers the whole hydrological cycle of the Syrdarya basin, one of the largest rivers of central Asia. The basin is divided into the following independent elements: (1) flow formation in the mountainous part; (2) transformation, use, and return of flow in the middle reaches; and (3) flow use in the lower reaches and its removal to the Aral Sea. The purpose of the system of algorithms is to check on the model and work out a method of estimating the optimal regime of simultaneous operation of the system of reservoirs in the basin. From the simulation results, the following are calculated: tables of optimal regimes of water releases from reservoirs for a series of years; tables of corrected values of water consumption; and a table of water consumption probabilities. OPTIMIZATION OF A THREE-RESERVOIR SYSTEM BY DYNAMIC PROGRAMMING,
Ministerio de Obras Publicas, Madrid (Spain). Geologico Servicio.
L. L. Garcia.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 936-941. 2 fig, 7 ref.

Descriptors: *River systems, *Reservoirs, *Dynamic programming, *Water demand, *Hydrology, Economics, Reservoir operation, Monthly, Computer programs, Water supply, Synthetic hydrology, Probability, Hydrologic data, Benefits, Mathematical models, Systems analysis, Irrigation, Constraints, Monte Carlo method.
Identifiers: Benefit maximization, Spain.

A Y-shaped river system has one reservoir on each of the branches of the Y figure. Spills from reservoirs 1 and 2 feed reservoir 3. Reservoir 1 can feed reservoir 2 through a diversion canal. Each reservoir has an independent system of water users, including irrigation, municipal and industrial supply, flood control, power, and minimum streamflows. A dynamic programming algorithm optimizes the monthly operation of the system for a given input of hydrological data. Thus it is possible to run the program for several samples of synthetic hydrology. The set of results may be analyzed statistically and the optimal operating policy may be selected in terms of probability. The objective function is benefit maximization. The program may be used either for systems fitting into the configuration assumed or for complex systems which, when simplified, may be reduced to this pattern. (See also W77-06708) (Bell-Cornell)

OPTIMAL DESIGN AND OPERATION OF RESERVOIR SYSTEMS,
New South Wales Univ., Kensington (Australia). School of Civil Engineering.
A. J. Askew, W. W-G. Yeh, and W. A. Hall.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 942-949. 1 fig, 6 ref. OWRT B-061-CALIF(14).

Descriptors: *Simulation analysis, *Reservoir operation, *Monte Carlo method, Streamflow forecasting, Hydrology, Reservoir design, Constraint, Optimization, Probability, Stochastic processes, Computer programs, Failures, Mathematical models, Systems analysis.
Identifiers: Release rules.

Many sophisticated analytical procedures produce output which is not related to any given probability of failure, and therefore they cannot be used with confidence in the design and operation of water resources systems. A simple procedure is proposed which involves the use of Monte Carlo techniques in deriving the optimum value for any particular parameter of a reservoir system. The purpose of the paper is to demonstrate the ease and simplicity of the simulation approach and to indicate how great a quantity of information regarding the response of a system can be derived from such an analysis. Herein, the constraints are imposed by setting maximum permissible probabilities of failure. The procedure can be used to analyze a variety of complex reservoir systems. Probability tables derived from the analysis may be employed to improve the efficiency of operation of the reservoir system, particularly where detailed knowledge of the streamflow forecasting capability is available. The financial benefit of such forecasts can thereby be assessed. (See also W77-06708) (Bell-Cornell)

Identifiers: *Barcelona(Spain), Llobregat Delta(Spain).

Barcelona, one of the two largest cities in Spain, has ever-increasing water supply problems. The present situation calls for the optimum utilization of all local resources rather than the construction of costly water transference canals. The local resources rather than the construction of costly water transference canals. The Llobregat River is the primary source of water and its associated alluvium acts as an important regulation system upon which many different types of supply are totally dependent. The aquifers in the Lower Llobregat and its delta have been modeled in order to provide a tool for optimizing their utilization and adequate management; however, at the opportune moment, they may be employed to stop, or at least reduce, the degree of sea-water intrusion and to improve artificial recharge. The mathematical model consists of two sets of superimposed polygons which simulate the two aquifers existing in the delta area. This model has certain special characteristics which were included in order to obtain a better adjustment to the boundary conditions and to the local hydrological conditions of the area. The model, which appears to be a useful management tool, has been programmed in general form which will allow for processing by different types of computer, as well as admitting changes in the geometrical network and the input functions. INTEGRATION OF AQUIFERS IN FLOOD CONTROL PROJECTS,
Technion - Israel Inst. of Tech. Haifa. Dept. of Agricultural Eng.
N. Buras.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 965-977. 4 fig, 5 tab, 10 ref.

Descriptors: *Flood control, *Flood protection, *Aquifers, *Conjuctive use, *Linear programming, Reservoir operation, Reservoir releases, Flooding, River basins, Water storage, Streamflow, Irrigation, Constraints, Computer models, Flood damage, Equations, Mathematical models, Systems analysis, Optimization.
Identifiers: Damage minimization, Flood volume, Minimum release, Maximum release, Supply maximization.

The lower parts of river basins in many arid and semi-arid regions are often economically developed and intensively cultivated. Under such climatic conditions, wet season rainfall of high intensity may cause damaging floods. The system under consideration consists of surface components (a river and its tributaries, dams and reservoirs, and urban and irrigated areas) and of groundwater aquifers. The problem is to integrate operationally the aquifers within the system so as to minimize damages caused by flooding. A linear programming model has been set up and two modes of operating the system have been considered: (1) maximizing the release from the uppermost surface reservoir at the beginning of the wet season; and (2) minimizing this release. In both cases, the flood volume is diminished to the same amount, but the number of days when inundating streamflows occur is smaller in the first case. The factor limiting the effectiveness of the integration of aquifers within flood control projects is the rate of infiltration into these sub-surface formations. The system objective is to mitigate as much as possible the flood damages and, at the same time, to store as much water as possible for irrigation purposes. (See also W77-06708) (Bell-Cornell)

OPTIMAL SEASONAL AND SHORT-TERM OPERATION OF A RESERVOIR USED FOR FLOOD CONTROL AND WATER SUPPLY,
Water Research Association, Marlow (England).
J. A. Cole.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 978-988. 6 fig, 6 ref, append.

Descriptors: *Reservoir operation, *Dynamic programming, *Flood control, *Water supply, Multiple-purpose reservoirs, Regulation, Runoff, Decision making, Short-term planning, Seasonal, Monthly, Reservoir releases, Storm runoff, Water demand, Flooding, Hydrology, Downstream, Flood damage, Mathematical models, Systems analysis, Optimization.
Identifiers: Cost minimization, *Release rules, Reservoir contents.

Starting from an objective of minimizing the combined costs of deficient water supply and of flood damage downstream, the monthly release rules of a reservoir are found by using dynamic programming. Examples are shown of how the rules may depend not only on prevailing contents but

lso on the previous monthly infow. Methods of aking prior inflow into account, without having ny significant increase in the problem's dimenions, are tested. Computational efficiency is also nhanced by limiting the number of decision tates. Given the seasonal vaues of each contents tate, as one result of the dynamic programming alculations, it is then shown how short-term regulation of the reservoir contents may be decided, sing a quantitative forecast of storm runoff. TREAMFLOW REGULATION BY ARTIFIIAL RECHARGE FED FROM UPSTREAM URFACE STORAGE: DERIVATION OF CONROL RULES,
Vater Research Association, Marlow (England).
. Wyatt, D. G. Thorn, and P. A. Mawer.
n:Mathematical Models in Hydrology, roceedings of the Warsaw Symposium, Poland, uly 1971, Volume 2. IAHS/Unesco, Paris, rance, 1974, p 989-997. 7 fig, 4 ref.

Descriptors: *Streamflow, *Regulation, *Artificial echarge, *Dynamic programming, *Water torage, Groundwater, Surface waters, Upstream, Control, Aquifers, Conjunctive use, Constraints, Feasibility, Probability, Methodology, Costs, Markov processes, Algorithms, Rivers, Operaons research, Mathematical models, Optimizaon.
Identifiers: *Direct search method, *Control rules, Hill-climbing technique.

The conjunctive use of ground and surface water esources has been extensively reported for cases here inflows to the two sources are not strongly nked. In contrast, this paper considers the special ase of regulation of a common streamflow by ombined surface storage and artificial groundater recharge. Two methods are presented for nding control rules for regulating streamflow sing an on-channel surface store conjunctively ith abstraction from an artificial recharge to an quifer. The two methods are based on direct earch (hill-climbing) and dynamic programming ethods. The objective is to minimize use of the quifer, given that the operating costs of echarge/abstraction are higher than the costs of irect releases from the surface store. Comparave results are given for a single case, and further esults show the considerable reductions in surace storage made possible with the conjunctive se of artificial recharge. Identifiers: *River Llobregat(Spain).

This article is a general description of a mathematical model which simulates the surface water system of the basin of the River Llobregat in Spain. This description includes a general outline of the features of the basin, the generation of synthetic streamflow sequences at certain vital points within the basin, and the variables obtained as a result of the simulation process. The author describes generally the method of simulation; described also are the criteria employed in the economic evaluation of the statistical distribution of the variables in question, which were subsequently used to compare various solutions of basin management. OPTIMAL PLANNING OF FLOWS IN MULTIRESERVOIR HYDRO-POWER SYSTEMS,
Boeing Computer Services Inc., Seattle, Wash. Mathematical Analysis Unit.
S. L. S. Jacoby, and J. S. Kowalik.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/ Unesco, Paris, France, 1974, p 1028-1039. 3 fig, 11 ref.

Descriptors: *Long-term planning, *Reservoirs, *Flow, Optimization, Reservoir storage, Constraints, Computers, Economic feasibility, Decision making, Equations, Mathematical models, Systems analysis.
Identifiers: *Nonlinear programming, *Hydropower systems, Outflow, Sensitivity, Power deficit.

The problem of optimal planning of flows for a large number of relatively long time periods in multi-reservoir hydro-power systems is considered. It is shown that this is a nonlinear programming problem. The problem variables are either reservoir storage contents at the end of the planning periods or averages for the planning periods of reservoir outflows. The objective may be to minimize power deficit or to minimize the maximum of the power deficits in any of the planning periods. This large nonlinear programming problem needs to be solved repeatedly to study the sensitivity of the optimal plan to changes in systems configuration, side conditions and constraints. It is shown how to obtain a meaningful model of the system on a computer and how to obtain a scheme enabling repeated computations in an accurate and economically feasible manner. HYDROLOGICAL EVALUATION OF CHANGES IN RUNOFF CHARACTERISTICS,
Hydrologic Engineering Center, Davis, Calif.
L. R. Beard.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 1048-1055. 3 fig, 1 tab.

Descriptors: *Hydrology, *Evaluation, Effects, *Runoff, *River basin development, Economics, Urban runoff, Reservoir construction, Levees, Channel improvement, Floods, Assessment, Storms, Computer programs, Probability, Simulation analysis, Mathematical models, Systems analysis, *Floods.
Identifiers: Urban development, Lumped-parameter model, Unit hydrograph procedure.

In addition to natural changes, there are cultural changes such as urban development, channel and levee improvements, and reservoir construction that can greatly affect flood runoff characteristics in a river basin, particularly when such changes are spread throughout the river basin. Some changes affect small floods and do not appreciably change maximum flood potential. Other changes might not affect the frequency and extent of minor floods but can substantially moderate or aggravate large floods. Many parts of the river basin are affected differently by any specific change. In order to evaluate all effects at all locations adequately, it is necessary to examine a large number of flood events of various magnitudes and of various areal and temporal characteristics under each pertinent set of basin characteristics. Described is a lumped-parameter model designed to perform the hydrological and economic evaluations for any type of river basin and for urban development, reservoir construction, and for levee and channel improvement. An example is given of a portion of a river basin where extensive channel improvement is proposed for the purpose of relieving frequent overbank flooding, and a computer program designed to accomplish the evaluation is described. Identifiers: *Vistula River(Poland), Planning data.

The Vistula is the largest river in Poland and the development of its water resources has a fundamental significance for the overall development of the country. The most recent studies concerning comprehensive development of the Vistula River water resources were undertaken within the framework of the UNDP/UN Vistula River Project. These are a continuation of the previous studies which have been in progress for several years. The purpose of the Vistula River Project is to determine the optimal basin-wide solutions by applying mathematical modeling techniques. This

paper describes the Vistula basin and the Vistula River Project. Special emphasis is laid on the methodical preparation of the basic planning data and their scope (input data for the mathematical models). (See also W77-06708) (Bell-Cornell)

Identifiers: *Vistula River(Poland), Target outflows, Operating rules, Inflow hydrology, Out-of-kilter algorithm, Cost minimization.

A multi-step method is described for the simulation of a multi-reservoir river basin system. The method entails the use of three separate models to determine the optimum planning alternatives for the Vistula River system. The first model is called The Target Outputs Model; using the out-of-kilter algorithm, which is a special purpose linear programming method, the model determines the optimal (minimum) target releases from individual reservoirs for given inflows, water demands, outflow constraints and penalty costs for water deficits. The second model, The Reservoir Operating Rules Model, utilizes stochastic dynamic programming and determines the reservoir releases in such a way that departures from the release targets are minimized for a given probability of distribution of inflows. It also finds the flows at control profiles downstream of the reservoirs. Finally, The Allocation Model considers the allocation of water deficits arising from the inability to meet all demands given the optimized operating rules from model number 2 and penalty costs for deficits. THE OUT-OF-KILTER ALGORITHM AS A SINGLE-STEP METHOD FOR SIMULATION AND OPTIMIZATION OF VISTULA RIVER PLANNING ALTERNATIVES,
Water Resources Engineers Inc., Walnut Creek, Calif.
I. P. King, J. Filimowski, and J. Kindler.
In: Mathematical Models in Hydrology, proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 1076-1083. 7 fig, 3 ref.

Descriptors: *River basins, *Reservoirs, *Simulation analysis, *Optimization, *Alternative planning, Linear programming, Algorithms, *Water allocation(Policy), Water demand, Computer programs, Computer models, Networks, Methodology, River flow, Pumping, Costs, Constraints, Operations research.
Identifiers: *Out-of-kilter algorithms, *Vistula River(Poland), Target costs, Cost minimization.

A mathematical model is described for the simulation of a multi-reservoir river basin system. The system is set up as a network of arcs and nodes. A special purpose linear programming algorithm (the out-of-kilter algorithm) is used to find the optimal, least cost allocation of water to all demands. Overlapping time periods are used to eliminate the need for prespecified policies for the reservoir. The entire model program is written in Fortran and processes up to 15 years with a basic net of 100 arcs in one simulation. The method is demonstrated using an example river network having three reservoirs and six points at which natural runoff is aggregated. (See also W77-06708) (Bell-Cornell)

FORECASTING FLOODS IN HAWAII (EXCLUDING HAWAII ISLAND),
National Weather Service, Honolulu, Hawaii. Pacific Region.
P. Haraguchi.
NOAA Technical Memorandum NWSTM PR-16, January 1977. 32 p, 10 fig, 6 tab, 37 ref.

Descriptors: *Hawaii, *Forecasting, *Warning systems, *Weather data, *Flood forecasting, *Flooding, Flood data, Rainfall, Thunderstorms, Lightning, Weather forecasting.

The floods from 1965 to the present (October 1976) were studied and the 11 most severe floods in respect to fatalities, monetary loss and areal extent were selected for detailed investigation. Observations of lightning and thunderstorms and short period intense rainfall were related to most floods since 1976. Data were insufficient for these studies prior to 1965. In summary there is, on the average, one severe localized flood a year. They occur mainly on Oahu, at night, from late November through early May. Flood damage averages about $1 million and damage amounts are increasing yearly mainly because of more property construction and inflation. Fatalities are not common. A 500-mb trough is usually present west of the islands before flooding. On Oahu and Maui, flood associated with low level easterlies occurred on windward side or just lee of windward mountain while flood preceded by deep southwesterlies occurred in the normally dry leeward area. Lightning and thunder observations are good indicators of possible flooding. In the severe floods, the rainfall for 1/2, one, and two hours prior to flooding exceeded the critical rainfall values. DELINEATION OF FLOOD HAZARD AREAS: FLOOD HAZARD REPORT NO. 2, RARITAN RIVER.
Anderson-Nichols and Co., Inc., Boston, Mass.
Prepared for Department of Environmental Protection, Division of Water Resources, State of New Jersey, March 1972. 30 p, 13 fig, 15 plates, 6 tab, 4 ref.

Descriptors: *New Jersey, *Floods, Flooding, *Design flood, *Flood profiles, *Floodways, *Flood plains, *Flood protection, *Non-structural alternatives, *Control structures, Streamflow forecasting, Historic floods, Peak discharge, Flood plain zoning, Flood plain insurance, Erosion control, Channel improvement, Watershed management.
Identifiers: *Raritan River(NJ), *Flood fringe area.

General reasons for flooding problems as well as specifics about the Raritan River situation are given. Three hundred and thirty-one lineal stream miles of flood plains were studied within the 1,100 sq mi of Raritan River Basin. This study covers the Raritan River and contains some information on 6 sub-watersheds: South Branch and North Branch Raritan River, Millstone River, Green Brook, Lawrence Brook and South River. A number of major floods have occurred since the earliest recorded in 1810. The 30.6 mi segment of the Raritan River in this report slopes at an average of 2.3 ft/mi and flows through 18 communities. Design discharges have been calculated for this region. For the Floodway, the discharge is 2.4 times the Mean Annual Flood and for the Flood Hazard Area it is 3.0 times the Mean Annual Flood. The peak discharge for the Floodway is 54,000 cubic feet per second and for the Flood Hazard Area, 67,500 cfs. Contour maps show the delineation of the Floodway and Flood Fringe Area. The following recommendations are given: communities along the river should establish regulations to control land use along the river; no fill or structure should be permitted in the floodway which would alter the natural flow of the river; in the flood fringe the lowest floor elevation should be at least a foot above the flood hazard design elevation; the possibility of structural flood reduction measures should be considered periodically; National Flood Insurance should be considered; and municipalities should consider taxing land that is not suitable for development because of location in a flood area. (Smith-North Carolina)

FLOOD HAZARD INFORMATION: CAVE CREEK, ARIZONA CANAL TO 19TH AVENUE, PHOENIX, ARIZONA.
Army Engineer District, Los Angeles, Calif.
Prepared for Flood Control District of Maricopa County, Arizona, October 1971. 15 p, 5 fig, 13 plates.

Descriptors: *Arizona, *Floods, Flooding, *Flood profiles, *Flood plains, Flash flood, Annual flood, Streamflow forecasting, Maximum probable flood, Historic floods, Flood data, Peak discharge, Flood peak, Bank erosion, Floodways, Channels, Obstruction to flow, Dams, Channel improvement.
Identifiers: *Phoenix(AZ), *Cave Creek(AZ), *Intermediate Regional Flood, Arizona Canal(AZ), 50-year flood.

Land in the floodplains of this study area in the northwest part of Phoenix has been largely undeveloped to date, but pressure for development is expected to increase. Phoenix grew from a population of 107,000 in 1950 to 582,000 in 1970. The de-

mand for urbanization of flat land has been strong. Cave Creek, which drains 252 sq mi, originates in the mountains north of Phoenix and ends at its confluence with Arizona Canal. The flood season is generally from July through October, although floods can occur in any month. Floods are caused by general winter storms, general summer storms and local summer thunderstorms which cause flash floods, usually less than 3 hrs duration. Major floods occurred in 1905 and 1921. Cave Creek Dam, completed in 1923, serves as protection and has never been overtopped. The 1943 flood, largest since completion of the dam, had a peak discharge of 9,000 cubic ft/sec. It is predicted in an Intermediate Regional Flood, a peak discharge of 21,000 cfs will occur at the confluence of Cave Creek with Arizona Canal. Average channel velocities could range from 8-16 ft/sec. During a 50-year flood, a peak discharge of 13,000 cfs is anticipated with average channel velocities of 7-14 ft/sec. The sharp curve of the improved earth channel downstream from 19th Avenue could cause an erosion problem on the north and west bank of the channel. Several bridges over Cave Creek and Arizona Canal obstruct flood flows. In the past the canal has been overtopped several times. No federal flood control projects exist in the area, but Phoenix is undertaking some channel improvement. The Corps of Engineers has authorized a dam and channel system downstream of Cave Creek Dam. PRELIMINARY ASSESSMENT OF THE WATER RESOURCES OF THE TULALIP INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash. Water Resources Div.
B. W. Drost.
Open-file report 76-493, 1977. 89 p, 17 fig, 1 plate, 16 tab, 21 ref.

Descriptors: *Water resources, *Indian reservations, *Washington, *Available water, *Water quality, Surface waters, Groundwater resources, Aquifer characteristics, Hydrogeology, Water utilization, Water yield, Water demand, Chemical analysis, Water supply.
Identifiers: *Tulalip Indian Reservation(Wash).

In 1974 about 30 percent of the nearly 600 acre-feet of water used on the Tulalip Indian Reservation, Washington, was obtained from a surface-water reservoir, while nearly 70 percent was obtained from ground-water sources. Domestic use accounted for about 93 percent of total water use. Nutrient (phosphorus) concentrations measured in most surface-water samples were less than the maximum limit recommended by the U.S. Environmental Protection Agency. The recommended maximum limit for total coliform bacteria was never exceeded. Ground water is withdrawn from aquifers in unconsolidated deposits. Shallow aquifers, which provide about 45 percent of the total ground-water supply, are tapped by about 250 wells and yield 5 to 20 gpm to 30- and 42-inch diameter dug wells. Deeper aquifers yield about 55 percent of the ground-water supply to about 125 wells that are mostly between 100 and 150 feet deep. Yields are generally at least 20 gpm to 6- and 8-inch wells, and several wells have yields exceeding 300 gpm. Water in the shallow aquifers generally had an excessive concentration of dissolved iron, often exceeding the recommended maximum limit of 0.30 mg/liter, and total coliform bacteria in water from six wells exceeded 1 colony per 100 milliliters of water. Some wells in the deeper aquifers yield water with dissolved iron and (or) manganese concentrations exceeding the recommended maximum limit of 0.30 and 0.05 mg/liter, respectively. Although many deep coastal wells bottom far below sea level, only two wells indicated local saltwater intrusion. An aquifer underlying the central plateau and an artesian aquifer in the northeastern part of the reservation appear to offer the best potential for development of additional ground-water supplies. (Woodard-USGS)

IMPROVING ESTIMATES OF STREAMFLOW CHARACTERISTICS USING LANDSAT-1 (ERTS-1) IMAGERY,
Geological Survey, Nashville, Tenn. Water Resources Div.
E. F. Hollyday.
Journal of Research of the U S Geological Survey, Vol 4, No 5, p 517-531, September-October 1976. 3 fig, 6 tab, 11 ref.

Descriptors: Streamflow forecasting, *Remote sensing, *Satellite(Artificial), *Aerial photography, *Photogrammetry, Equations, Methodology, Evaluation, Regression analysis, Statistical models, Watersheds(Basins), Delaware, Maryland, Virginia.
Identifiers: *Delmarva Peninsula, Landsat-1.

Imagery from the first Earth Resources Technology Satellite (renamed Landsat-1) was used to discriminate physical features of drainage basins in an effort to improve equations used to estimate streamflow characteristics at gaged and ungaged sites. Records of 20 gaged basins in the Delmarva Peninsula of Maryland, Delaware, and Virginia were analyzed for 40 statistical streamflow characteristics. Equations relating these characteristics to basin characteristics were obtained by a technique of multiple linear regression. A control group of equations contains basin characteristics derived from maps. An experimental group of equations contains basin characteristics derived from both maps and imagery. Comparison of equations in the control group with corresponding equations in the experimental group reveals that for 12 out of 40 equations the standard error of estimate was reduced by more than 10 percent. It is concluded that data from Landsat imagery can substantially improve the accuracy of estimates of some streamflow characteristics at sites in the Delmarva Peninsula. (Woodard-USGS)

ON LARGE-SCALE SIMULATION OF GROUNDWATER FLOW SYSTEMS,
Institut fuer Wasserwirtschaft, Berlin (East Germany).
K. Tiemer.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2, IAHS/Unesco, Paris, France, 1974, p 887-891. 1 fig, 4 ref.

Descriptors: *Groundwater resources, *Simulation analysis, *Aquifers, *Subsurface investigations, Management, Water demand, Flow, Hydrogeology, Mathematical models, Equations, Systems analysis, Methodology.
Identifiers: German Democratic Republic, Geohydraulic research, Subsurface reservoirs, Water availability.

The unfavorable relation between water demands and available water resources in the German Democratic Republic requires the optimal utilization of water resources, especially the efficient management of groundwater resources. To solve this problem, it is necessary to develop practicable

models of managed aquifers, an essential requirement for geohydraulic research in this country. In the areas of interest, the groundwater flow may be assumed to be in a horizontal plane. The difficulties of the mathematical problem result from the non-homogeneous hydrogeological properties of the aquifers and the complicated time-variable boundary conditions. However, combining mathematical and experimental methods it is possible to obtain acceptable approximate solutions, provided that all model parameters are known. In most cases, these parameters are widely unknown. Therefore, the simulation of typical groundwater situations is important for the development and testing of aquifer models. The effectiveness of the method presented herein--'Simulation of natural processes' or Indirect hydrological exploration'--is demonstrated using an example of a subsurface reservoir. As a result of this investigation, a proven mathematical model is available as well as a practicable solution algorithm. The model constitutes an adequate basis for precalculating the effects of intended water management measures on the groundwater balance. (See also W77-06708) (Bell-Cornell)

THE CONJUNCTIVE USE OF A MULTI-RESERVOIR SYSTEM AND A DUAL-PURPOSE DESALTING PLANT,
Sahand Co., Tehran (Iran).
F. Mobasheri, and V. Budhraja.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 895-900. 2 fig, 2 tab, 6 ref.

Descriptors: *Conjunctive use, Surface waters, *Desalination plants, *Dynamic programming, *Multiple-purpose reservoirs, Optimization, Reservoir operation, Water supply, Economic efficiency, Simulation analysis, Algorithms, Computer models, Operations research, Mathematical models.
Identifiers: Benefit maximization.

Products from surface reservoirs are subject to natural fluctuations in supply due to uncertainty in projecting the future stream flow data. A desalting plant used as a reserve capacity provides the possibility of producing fresh water to fill firm water demand during critical periods of surface water supply. This means that the firm water supply from surface reservoirs can be raised in the conjunctive system. Benefit from such an increase in supply can be larger than the cost of a dual-purpose desalting plant which produces water during critical periods of surface water supply and electricity when there is no need for fresh water from the desalting plant. Using the incremental dynamic programming technique, a mathematical model is developed to find the optimum conjunctive use of surface and desalted water which maximizes benefits. Several reservoir system configurations are used, e.g., reservoirs in series on the same river and parallel in different rivers. Reservoirs are multi-purpose, providing flood control, power production, water supply, and water quality control. The model functions on monthly stream flow data. State variables are monthly storage levels in the reservoirs and decision variables are monthly releases from reservoirs and the amounts of water produced by the desalting plant. In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 1017-1022. 2 fig, 5 ref.

Descriptors: *Conjunctive use, *Aqueducts, *Aquifers, *Surface waters, Alternative planning, Groundwater, Pumping, Water storage, Feasibility, Recharge, Water demand, *River basins, Regional development, Operations research.

Spain's Tajo-Segura Aqueduct, currently under construction, will divert 1200 Hm per year from the Tajo to the Segura Basin. The possibility if integrating the aquifers of the La Mancha area underlying the Aqueduct is discussed. Various alternatives are proposed: use of the water reserves; groundwater pumping only in dry years; use of the aquifers as storage units; feasibility of using the Aqueduct under a greater initial capacity in order to recharge the aquifers; or combinations of several of these alternatives. Groundwater studies are being carried out to obtain a better knowledge of these aquifers. (See also W77-06708) (Bell-Cornell)

HYBRID COMPUTER ANALYSIS OF A COMBINED SURFACE WATER--GROUNDWATER SYSTEM,
City Univ., London (England). Dept. of Civil Engineering.
W. J. Morris, and N. W. Morgan.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 1023-1027. 4 fig, 6 ref.

Descriptors: *Hybrid computers, *Surface waters, *Groundwater, *Simulation analysis, Conjunctive use, Hydrology, Hydraulics, Management, Alternative planning, Aquifers, Equations, Mathematical models, Systems analysis, *Computer models.
Identifiers: Linear equation, Nonlinear equation, Groundwater levels.

An analysis of a combined surface water--groundwater system with the aid of a hybrid computer is outlined and an assessment is made of the importance of the nonlinear terms in the partial differential equations used for simulating the groundwater system. For purposes of this study, the surface water system is considered as including the unsaturated zone and the hydraulic and hydrological processes at ground level, and the groundwater system is considered as all water within the saturated zone. It is shown that the accuracy of a simulation of such a combined system usng a hybrid computer is largely dependent on the availability and accuracy of the basic input data. A rapid and accurate evaluation of the controlling hydrological parameters can be made and the effect on groundwater levels of various water resource planning alternatives can be evaluated. ECONOMIC ANALYSIS OF ALTERNATIVE GROUNDWATER WITHDRAWAL RATES IN CONJUNCTION WITH SURFACE WATER IRRIGATION,
Washington State Univ., Pullman. Coll. of Agriculture.
M. Feldman, N. K. Whittlesey, and W. R. Butcher.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 026, Price codes: A07 in paper copy, A01 in microfiche. Washington Water Research Center, Pullman, Report No 27, September 1976. 126 p, 28 tab, 5 fig, 12 ref, append. OWRT B-051-WASH(2). 14-31-0001-3945.

Descriptors: Groundwater, *Withdrawal, *Conjunctive use, *Irrigation, Aquifers, *Economics, *Groundwater mining, *Input-output analysis, Water level.
Identifiers: Groundwater management.

Eastern Washington is experiencing rapid declines in groundwater levels due to irrigation pumping of the essentially fixed stock of groundwater. This study develops a conceptual framework for comparing economic factors of the present management policy to avoid exceeding a 10 foot per year decline in the static water level with alternative policies allowing greater decline rates or augmenting the water supply with surface water diverted from the Columbia River. A well cost model was developed to provide estimates of water costs for every potential well in the study area under alternative rates of water level decline. A computer model of the groundwater aquifer was utilized to provide estimates of the amount and location of the water that could be withdrawn from the aquifer while remaining within the limits of any management policy. An agricultural model (utilizing linear programming) calculated discounted net returns to agriculture, including non-irrigated agriculture, over a 50 year period. An input-output model was used to estimate the secondary economic impacts of additional irrigation development that could result from alternative management policies. Results showed that the actual depth from which water may be pumped depends heavily upon the rate of decline and the static water level. If water levels are relatively stable, water may be economically pumped from considerable depths. Rapid decline rates in the static water level will reduce the absolute depth at which water may be pumped economically. The results indicate that some economic gains would accure to irrigated farms and the local economy under policies which encourage more water use. However, the economic gains are proportionately much less than the changes in water use required to induce the economic gain.

TABLES AND TYPE CURVES FOR ANALYSIS OF PUMP TESTS IN LEAKY PARALLEL-CHANNEL AQUIFERS,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
A. Vandenberg.
Technical Bulletin No 96, 1976. 28 p, 3 tab, 7 fig, 5 ref, 18 plates.

Descriptors: *Aquifers, *Leakage, Analysis, Curves, Computer programs, *Canada, Pumping.
Identifiers: *Parallel-channel aquifers, Esterhazy, Saskatchewan, *Leaky aquifers.

Analysis of drawdown data from pump tests in channel aquifers - as for example, buried bedrock channels - can be cumbersome when leakage effects and boundary effects set in simultaneously. Bukhari et al. (1969) have described a method for determining the leakage factor for cases where transmissivity and storativity can be determined from the early part of the drawdown data. Vandenberg (1976) has shown that if the distance measured along the axis of the channel between the pumped well and the observation well is greater than the width of the channel, the time-drawdown curve at the observation well can be closely approximated by assuming linear flow in the aquifer. This publication contains: (1) Extensive tables for the well function for leaky parallel-channel flow; (2) The corresponding type curves at a scale of .85 inches/log cycle, suitable for curve matching; (3) Several sets of type curves for cases where either the method of Bukhari et al. (1969) nor of Vandenberg (1976) can be used; (4) A computer program for plotting type curves for leaky artesian drawdown in a parallel channel for any configuration of pumped well and observation well; and (5) Examples illustrating the use of the type curves. ANALOG-MODEL SIMULATIONS FOR SECONDARY CANAL CONTROLS AND FORWARD PUMPING WATER-MANAGEMENT SCHEMES IN SOUTHEAST FLORIDA,
Geological Survey, Tallahassee, Fla. Water Resources Div.
E. H. Cordes, and R. A. Gardner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-264 825, Price codes: A04 in paper copy, A01 in microfiche. Water-Resources Investigations 76-93, December 1976. 60 p, 35 fig, 9 tab, 10 ref.

Descriptors: *Model studies, *Flow control, *Canals, *Florida, *Analog models, Flow augmentation, Water management(Applied), Low-flow augmentation, Groundwater recharge, Water storage, Pumping, Water wells.
Identifiers: Southeast Florida, *Biscayne aquifer(Fla).

The analog model of the Biscayne aquifer of southeast Florida was used to approximate the effects of two proposed water-management schemes. One involved adding a secondary control structure in a major canal which is controlled near the coast. In the model the controls were operated in accordance with canal water level both above and below the secondary control. Although the model could not differentiate between control openings of 1 foot or 5 feet, it showed that the secondary control is a viable method of conserving ground water. The second scheme involved pumping ground water ('forward pumping') from the Biscayne aquifer in inland areas during the dry season to: (1) augment canal flows toward the coast to sustain ground-water levels there, and (2) generate additional ground-water storage space for recharge in the wet season. Several sites on the model were programmed for forward pumping wells and the storage change was noted as a percentage of the ground-water withdrawal. (Woodard-USGS)

HYDROLOGIC INTERPRETATION OF GEOPHYSICAL DATA FROM THE SOUTHEASTERN HUECO BOLSON, EL PASO AND HUDSPETH COUNTIES, TEXAS,
Geological Survey, El Paso, Tex. Water Resources Div.
J. S. Gates, and W. D. Stanley.
Open-file report 76-650, November 1976. 37 p, 6 fig, 1 tab, 26 ref.

Descriptors: *Groundwater resources, *Surveys, *Remote sensing, *Instrumentation, *Texas, Geophysics, Electrical resistance, Evaluation, Aircraft, Geological surveys, Aquifer characteristics, Supplemental irrigation, Water supply.
Identifiers: *El Paso area(Tex), Airborne-electromagnetic surveys, Earth-resistivity surveys.

Airborne-electromagnetic and earth-resistivity surveys were used to explore for fresh ground water in the Hueco Bolson southeast of El Paso, Texas. Aerial surveys were made along about 500 miles of flight line, and 67 resistivity soundings were made along 110 miles of profile. The surveys did not indicate the presence of any large bodies of fresh ground water, but several areas may be underlain by small to moderate amounts of fresh to slightly saline water. The material underlying the flood plain of the Rio Grande is predominantly clay or sand of low resistivity. Along a band on the mesa next to and parallel to the flood plain, more resistive material composed partly of deposits of an ancient river channel extends to depths of about 400 to 1,700 feet. Locally, the lower part of this more resistive material is saturated with fresh to slightly saline water. The largest body of fresh to slightly saline ground water detected is between Fabens and Tornillo, Texas, mostly in the sandhill area between the flood plain and the mesa. Under assumed conditions, the total amount of water in storage may be as much as 400,000 to 800,000 acre-feet. The resistivity data indicate that the deep artesian zone southwest of Fabens extends from a depth of about 1,200 feet to about 2,800 feet. (Woodard-USGS)

Descriptors: *Water supply, *Water demand, *Watershed management, *Hydrologic budget, *Water resources, Surface waters, Groundwater, Water quality, Water utilization, Water well, Aquifers, Pumping, Drawdown, Surface-groundwater relationships, *Irrigation, Municipal water, Evaluation, Available water, *Washington.
Identifiers: *Palouse River basin(Wash).

Surface-water supplies are inadequate for irrigation in much of the Palouse River basin in eastern Washington, and dryland wheat farming characterizes much of the area. Along the valleys where farms are irrigated from streams, upstream diversions during the low-flow period have sometimes depleted streamflow to the detriment of downstream irrigators. However, suitable sites for reservoirs for storage of winter and spring streamflows for summer irrigation are scarce; also, the large quantity of sediment deposited by streams in the basin would limit the usefulness of reservoirs.

A study directed toward defining low-flow characteristics of the streams could provide valuable information to water management agencies in the basin. A major ground-water problem exists in the heavily populated area of Pullman, where extensive pumping from wells for municipal supplies has lowered the artesian pressures to such an extent that wells that once flowed freely no longer do so. Any plan for continued development of the ground-water resource should include a wide spacing of new wells and a careful monitoring of water levels until the capacity of the local aquifers has been determined. Artificial recharge of aquifers may not be practical in the Palouse River basin because of the limited availability of surplus surface water to serve for recharge, and because the high sediment load in the surface water would require extensive treatment of the recharge water. 4C. Effects On Water Of Man's Non-Water Activities

ANTIEROSION ROLE OF FOREST PLANTINGS IN THE STEPPE ZONE OF THE MOLDAVIAN SSR, (IN RUSSIAN),
N. A. Pinchuk.
Izv Akad Nauk Mold SSR Ser Biol Khim Nauk 3, p 10-14, 1975.

Descriptors: *Erosion control, *Planting management, *Forest management, *Sediment discharge, Soils, *Permeability, *Runoff, Regulation, Oak, Scotch pine trees, Trees, Black locust trees, Maple trees, Shrubs.
Identifiers: *Moldavian SSR, USSR.

The effect of antierosion tree plantings of different composition on runoff, sediment discharge and water permeability of soils was studied by the artificial sprinkling method on 0.5 x 0.5 m runoff microplots. In southern Moldavian-SSR (USSR) forest litter in antierosion plantings serves as a hydrologic regulator. To accumulate and preserve forest litter these plantings should be made with a dense shrub undergrowth of a shady or semishady structure, mainly with oak on soils with average erosion and Scots pine and black locust with Norway maple on severely eroded soils.--Copyright 1976, Biological Abstracts, Inc.

SEDIMENT DISCHARGE FROM AN AREA OF HIGHWAY CONSTRUCTION, APPLEMANS RUN BASIN, COLUMBIA COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, Pa. Water Resources Div.
D. A. V. Eckhardt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-263 616, Price codes: A03 in paper copy, A01 in microfiche. Water-Resources Investigations 76-111, October 1976. 25 p, 6 fig, 4 tab, 16 ref.

Descriptors: *Sediment transport, *Sediment yield, *Soil erosion, *Road construction, *Storm runoff, Data collections, Turbidity, Sedimentation, Sediment control, *Pennsylvania.
Identifiers: Columbia County(Penn), Susquehanna River basin(Penn), Applemans Run basin(Penn).

The effects of highway construction on stream sediment loads were studied in Applemans Run basin, Columbia County, Pa., from October 1971 to May 1974. During the investigations, about 5,200 tons of suspended-sediment were discharged from the basin. Of this amount, about 2,700 tons, or about half the total sediment discharge, as derived from the highway construction area. Annual suspended-sediment yields from 17.5 acres under construction ranged from 40,000 to 66,000 tons/sq mi in the 1972 and 1973 water years, respectively. In the 1972 and 1973 er years of active construction, 83 percent of the sediment transported from the construction site was eroded each year in storms from January to June. Seasonal trends in sediment discharge for 1972 show that 69 percent of that year's suspended-load was transported in April, May, and June, whereas less than 1 percent was transported in July, August, and September. (Woodard-USGS)

URBANIZATION AND FLOODING IN SHADES CREEK BASIN, JEFFERSON COUNTY, ALABAMA,
Geological Survey, Tuscaloosa, Ala. Water Resources Div.
A. L. Knight.
Alabama Geological Survey, University, Information Series 55, December 1976. 73 p, 42 fig, 11 tab, 8 ref.

Descriptors: *Flood control, *Urbanization, *Flood forecasting, *Computer models, *Alabama, Flood profiles, Flood frequency, Regression analysis, Storm runoff, Storm drains, Surface runoff, Planning, Urban hydrology, Watershed management.
Identifiers: Jefferson County(Ala), *Shades Creek basin.

The magnitude of the 25-, 50-, 100-, and 500-year floods for drainage basins having various degrees of urban development in Jefferson County, Alabama may be estimated from graphical and mathematical relations. The basic equations utilize the relations among drainage area, lag time, a length-slope parameter, and percent imperviousness for a particular drainage basin. The relations presented in this report, and the U.S. Geological Survey step-backwater computer program, were used to compute water-surface profiles along Shades Creek. Flood profiles and maps were determined on the basis of main channel conditions as surveyed prior to December 1973 but assuming complete urbanization within the remaining part of the drainage basin. A completely urbanized area is defined as an area where curbing, guttering, and storm sewers are complete and where more than 45 percent of the watershed has impervious cover. (Woodard-USGS)

SEDIMENT YIELD PREDICTION BASED ON WATERSHED HYDROLOGY,
Agricultural Research Service, Temple, Tex.
J. R. Williams, and H. D. Berndt.
Paper No. 76-2535, American Society of Agricultural Engineers 1976 Winter Meeting, Chicago, Illinois, December 14-17, 1976. 14 p, 3 tab, 12 ref.

Descriptors: *Sediment yield, *Forecasting, *Hydrology, Watersheds(Basins), Reservoir design, Model studies, Runoff, Computers, Erosion, Equations, Farm management, Erosion control, Costs, Curves, Soil moisture, Peak discharge.
Identifiers: *Sediment-runoff model, *Modified universal soil loss equation, Sediment delivery ratio, Gross erosion.

A model for predicting sediment yield from ungaged watersheds was developed by attaching a sediment yield model to hydrologic models. The sediment-runoff model is useful in reservoir design and water quality modeling because daily, monthly, and annual sediment yield can be predicted with simple inputs and low computer costs. (Visocky-ISWS)

CURRENT METHODS USED IN THE SOIL CONSERVATION SERVICE TO ESTIMATE SEDIMENT YIELD,
Soil Conservation Service, Fort Worth, Tex.
E. C. Nicholas.
Paper No. 76-2532, American Society of Agricultural Engineers 1976 Winter Meeting, Chicago, Illinois, December 14-17, 1976. 8 p, 2 fig, 7 ref.

Descriptors: *Sediment yield, *Sedimentation rates, *Soil conservation, *Estimating, Forecasting, Equations, Erosion, Soil erosion, Suspended load, Deposition(Sediments), Methodology, Reservoirs, Land management, Farm management, Aerial photography, Curves.
Identifiers: *Universal soil loss equation, Gross erosion, Sediment delivery ratio.

The four basic procedures currently used in the Soil Conservation Service to estimate sediment yield depending on the environment and available data are: (1) gross erosion and sediment delivery ratio estimates, (2) predictive equations, (3) suspended sediment load measurements, and (4) sediment accumulation measurements. For verification, it is desirable to use more than one method. (Visocky-ISWS)

DIMINUTION RATIOS FOR PLANNING CONSTRUCTION-AREA SEDIMENT CONTROLS,
Geological Survey, Reston, Va. Water Resources Div.
H. P. Guy.
In: Proceedings of National Symposium on Urban Hydrology, Hydraulics, and Sediment Control, July 26-29, 1976, University of Kentucky, Lexington, Kentucky, p 91-97, 1976. 7 fig, 14 ref.

Descriptors: *Sediment control, *Erosion control, *Land management, Planning, Construction, Agriculture, Watershed management, Topography, Sediment yield, Analytical techniques.
Identifiers: Diminution ratio.

Planning erosion-control programs to limit sediment concentration in streams where part of the drainage bsin is construction area requires knowledge in the ratio of construction-area to rural-area concentration and the relative construction area of the basin. The diminution ratio required to obtain a specific stream concentration can be computed on the basis of these construction- and rural-area concentration determined from the Universal Soil Loss equation. The diminution ratio required to obtain a specific stream concentration can be computed on the basis of these construction- and rural-area concentrations determined from the Universal Soil Loss equation. The diminution ratio is the product of the factors necessry to achieve a specific limit of average sediment concentration in the stream draining the basin. Included are (1) the ratio of construction area to total area, (2) the sediment delivery factor, (3) the cropping management factor, and (4) the conservation practice factor. A map of the eastern United States shows diminution ratios based on a discharge-weighted annual stream-sediment concentration of 2,000 mg/liter, a soil erosivity factor of 0.4 a topographic effect factor of 1.0, and average annual stream-flow given by U.S. Geological Survey Hydrologic Atlas 212. GAS BUBBLE DISEASE OF SALMONIDS: A CRITICAL REVIEW,
Bureau of Sport Fisheries and Wildlife, Seattle, Wash. Western Fish Disease Lab.
R. R. Rucker.
Technical Paper No. 58, February 1972, 11 p., 3 tab., 35 ref.

Descriptors: Freshwater fish, *Fish diseases, *Fish hatcheries, Atmospheric gases, *Animal pathology, Oxygen, Nitrogen, Supersaturation, Water temperature, *Metabolism, Carbon dioxide, Analytical technique, Gas chromatography, Mass spectrometry, Saturation, Reviews.
Identifiers: Saturation tables, *Gas bubble disease, *Nitrogen supersaturation.

Fish maintained in water supersaturated with air reach equilibrium with the gases dissolved in water. These gases in the fish tend to equilibrate to the atmosphere the same as the gases in the water. Gas-bubble disease is characterized by bubbles under the skin, in the fins, tail, mouth, behind the eyeballs, and in the vascular system. Carbon dioxide does not cause gas-bubble disease. Oxygen can cause gas-bubble even below 350 percent air saturation, but nitrogen can cause the disease even below 118 percent air saturation. Excess gas in water can be produced by pressure, increase in temperature, and biotic metabolism, and can be reduced by exposure to air. Carbon dioxide and oxygen can be quantitated by tritrimetry, while nitrogen analysis requires manometry, gas chromatography, or mass spectrometry, Saturation tables for atmospheric oxygen and nitrogen in water for O to 30C. are presented. ZOOPLANKTON SAMPLING VARIABILITY: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Woods Hole Oceanographic Institution, Mass.
T. J. Lawson, and G. D. Grice.
Bulletin of Marine Science, Vol. 27(1), p. 80-84, 1977. 2 tab, 2 fig, 9 ref.

Descriptors: *Zooplankton, *Distribution, *Nets, *Sampling, *Variability, On-site data collection, Correlation analysis, Statistics, Analytical techniques, Methodology.
Identifiers: *Controlled experimental ecosystem, *Schindler plankton trap, Bongo net.

Zooplankton sampling variability in controlled experimental ecosystems (CEEs) was investigated using a small, vertically-hauled net and a Schindler plankton trap. Following sampling, all the zooplankton in the CEEs were collected by filtering the water. Based on precision, accuracy, and comparability between experiments, vertically integrated net hauls provide the best measure of zooplankton abundance in CEEs. (Katz)

DYNAMICS OF MICRO-ZOOPLANKTON POPULATIONS TREATED WITH COPPER: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
J. R. Beers, G. L. Stewart, and K. D. Hoskins.
Bulletin of Marine Science, Vol 27(1), p 66-79, 1977. 2 tab, 10 fig, 28 ref.

Descriptors: *Zooplankton, *Protozoa, Larvae, Biomass, *Bioassay, *Copper, On-site data collections, *Copper, *Heavy metals, Water pollution effects, Path of pollutants, *Biological communities, Monitoring, Bioindicators, Toxicity, On-site-investigations.
Identifiers: *Controlled experimental ecosystem, *Micro-zooplankton, Micrometazoa.

The taxonomic composition, numerical abundance, and biomass of the microzooplankton component of natural plankton populations from Saanich Inlet, British Columbia contained in large-volume (68 cu m) Controlled Experimental Ecosystems (CEEs) were monitored during two studies on the effects of copper. Populations subjected to 50 and 10 micrograms per liter copper were examined along with two control populations in the first experiment; enclosures with copper at 10 and 5 micrograms/l and a single control were observed during the second experiment. Differences between experimental and control CEE populations were greatest at the highest copper level, decreasing with lower concentrations. The major ciliate groups dropped out of the contained ecosystem with copper introduced at 50 micrograms/l and did not reappear. Oligotrich ciliates, but with different dominant species than in the controls, developed in environments to which 5 and 10 micrograms/l copper had been added. Among the important micrometazoan taxa, naupliar copepod abundances were lower relative to the controls in 50 and 10 micrograms/l, but not 5 micrograms/l, copper-treated enclosures. The observed effects on the micro-zooplankton taxa may not be related to direct action of copper on these organisms, but may have resulted from modifications to other trophic levels of the contained populations. (Katz)

EVALUATION OF POTENTIAL INDICATORS OF SUB-LETHAL TOXIC STRESS ON MARINE ZOOPLANKTON (FEEDING, FECUNDITY, RESPIRATION AND EXCRETION): CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
M. R. Reeve, M. A. Walter, K. Darcy, and T. Ikeda.
Bulletin of Marine Science, Vol 27(1), p 105-113, 1977. 3 tab, 1 fig, 14 ref.

Descriptors: *Marine animals, *Zooplankton, Copepods, Feeding rates, Fecundity, Respiration, *Copper, *Mercury, *Heavy metals, Water pollution effects, Toxicity, *Bioindicators, Laboratory tests, *Methodology, Mortality.
Identifiers: *Controlled experimental ecosystem, *Sub-lethal effects, Fecal pellet production, Egg production, LC 50.

Fecal pellet and egg production were used as indicators of the condition of small copepods exposed to low levels of copper and mercury in the laboratory. Natural copepod assemblages in three different locations were compared in their sub-lethal responses. Although effects could be demonstrated in the 1-10 microgram/l range, many biological and chemical factors combined to make it pointless to specify toxicity levels more precisely, particularly where the aim is to extrapolate data to other situations for regulatory purposes. Species composition, season, temperature, and chemical complexing capacity of the water would all introduce variability. It is suggested that in this concentration range, the kind of metal present may be less important than the total amounts. Respiration and excretion rates of zooplankton were not found to be sensitive indicators of sub-lethal stress. (Katz)
W77-06617

THE GROWTH OF YOUNG SALMONIDS (ONCHORHYNCHUS KETA): CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
British Columbia Univ., Vancouver. Inst. of Oceanography.
P. Koeller, and T. R. Parsons.
Bulletin of Marine Science, Vol 27(1), p 114-118, 1977. 4 tab, 1 fig, 7 ref.

Descriptors: Salmonids, *Chum salmon, *Juvenile fish, *Fish food organisms, Zooplankton, Crustaceans, Food chains, *Copper, *Heavy metals, Water pollution effects, Growth rates, Productivity.
Identifiers: *Controlled experimental ecosystem.

The growth of juvenile chum salmon (Oncorhynchus keta) in full-scale (1700m3) controlled ecosystems was followed over a period of 45 days. The controlled ecosystems supported the growth of juvenile salmon when large crustacean zooplankton were present as part of the natural food chain in the enclosures. In the presence of small zooplankton the young salmon were unable to increase in weight. In contrast to the marked effect of diet on the growth of juvenile salmonids, the presence of 2.5 micrograms/l inorganic copper (10 x ambient level) caused no observable effect on the growth or survival of the fish. These experiments indicate that factors (pollutants or natural events) which alter the spectrum of prey items available to young fish may be more important than the direct effect of physical or chemical factors on juvenile fish. (Katz)

EXPERIMENTAL OBSERVATIONS ON THE EFFECTS OF COPPER ON COPEPODS AND OTHER ZOOPLANKTON: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Rosentiel School of Marine and Atmospheric Science, Miami, Fla.
M. R. Reeve, J. C. Gamble, and M. A. Walter.
Bulletin of Marine Science, Vol 27(1), p 92-104, 1977. 1 tab, 7 fig, 23 ref.

Descriptors: *Zooplankton, *Copepods, Digestion, Filtration, Feeding rates, *Copper, *Heavy metals, Water pollution effects, Toxicity, Mortality, Path of pollutants, On-site data collections, Predation, *Grazing, Biological communities, Food chains.
Identifiers: *Controlled experimental ecosystem, Pseudocalanus, Calanus, Euphausia, Pleurobrachia, Fecal pellet production rates, Egg production rates.

Laboratory experiments were performed on ingestion, filtration, and fecal pellet production rates of the copepods Pseudocalanus sp. and Calanus sp. and on the feeding rates of Euphausia sp. and Pleurobrachia sp. taken from controlled environmental ecosystems to which 0, 5, and 10 micrograms/l copper had been added. In all cases, reduced activity could be demonstrated at these copper concentrations compared with populations from environmental controls. Data from sediment traps placed in the ecosystems suggested that effects of egg and fecal pellet production could also be observed. Population control by predation and grazing is also discussed. (Katz)
W77-06619

RESPONSE OF MACRO-ZOOPLANKTON POPULATIONS TO COPPER: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Woods Hole Oceanographi Institution, Mass.
V. R. Gibson, and G. D. Grice.
Bulletin of Marine Science, Vol. 27(1), p. 85-91, 1977. 3 tab, 3 fig, 9 ref.

Descriptors: *Zooplankton, *Fluctuations, Biomass, Biological communities, Sampling, Nets, On-site data collections, *Predation, Copepods, *Copper, *Heavy metals, *Water pollution effects, Toxicity, Mortality, Path of pollutants.

Identifiers: *Controlled experimental ecosystems, *Species composition, *Ctenophores, Medusae, Acartia sp., Pseudocalanus sp.

Fluctuations in zooplankton abundance and species composition are described for two copper experiments conducted in Controlled Experimental Ecosystems during 1974. Copper concentrations of 5, 10, and 50 micrograms/l were tested. The major phenomenon in both experiments was a severe reduction (>80%) in the abundance of zooplankton in all CEEs, control as well as copper polluted. A portion of the population decline was attributed to grazing by carnivorous ctenophores and medusae, making it difficult to quantitatively assess the effects of copper. The abundance of ctenophores and medusae remained higher in control than in copper perturbated CEEs, indicating that these organisms are adversely affected by the copper concentrations used in the experiments. At a nominal concentration of 50 micrograms/l copper, abundances of Pseudocalanus sp. and Acartia longiremis were reduced to 50% of their original levels 3-3.5 times more quickly than in the controls. Results in 5 and 10 micrograms/l CEEs were more variable and less significant. It is not known whether these effects were the direct result of copper on the organisms, or an indirect result of alterations at lower trophic levels. (Katz)
W77-06620

EFFECTS OF COPPER ON SILICIC ACID UPTAKE BY A MARINE PHYTOPLANKTON POPULATION: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Alaska Univ., College. Inst. of Marine Science.
J. J. Goering, D. Boisseau, and A. Hattori.
Bulletin of Marine Science, Vol. 27(1), p. 58-65, 1977. 4 tab, 21 ref.

Descriptors: *Phytoplankton, Silicates, *Copper, *Heavy metals, Water pollution effects, *Path of pollutants, *Bioassay, On-site investigation, Diatoms, Growth rates, Marine algae, Marine plants, *Silica, Plant growth, Plant physiology.
Identifiers: *Controlled experimental ecosystem, *Silicic acid uptake.

Stable isotope tracer techniques were used to examine the effect of copper on silicic acid uptake by natural populations of marine phytoplankton. Short term exposures (1-6 days) of phytoplankton to four levels of added copper, 2.5, 5.0, 10.0, and 25.0 micrograms/l were studied. Copper additions, in general, inhibited uptake when compared to controls with the greatest effect at 25 micrograms/l copper. Uptakes at this copper concentration ranged from 49-98% of the control with a mean of 61% and many values near 50%. The estimated rates of dissolution of silica from phytoplankton cell walls in the presence or absence of copper were low. This implies that exposure of siliceous phytoplankton to copper up to 25 micrograms/l does not greatly alter their dissolution rate. (Katz)
W77-06621

RESPONSE OF NATURAL MARINE BACTERIAL POPULATIONS TO COPPER: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
Woods Hole Oceanographic Institution, Mass.
R. F. Vaccaro, F. Azam, and R. E. Hodson.
Bulletin of Marine Science, Vol. 27(1), p. 17-22, 1977. 4 fig, 12 ref.

Descriptors: *Copper, *Heavy metals, *Marine bacteria, *Phytoplankton, Ions, On-site data collection, Photosynthesis, Biological communities, Succession, Resistance, *Water pollution effects, Path of pollutants, *Toxicity, Mortality.
Identifiers: Enclosed marine ecosystem, Heterotrophic bacteria, *Copper ion.

The addition of Cu^{2+} at 10 and 50 micrograms/l to two enclosed marine ecosystems led to a marked increase in the relative numbers and activity of bacterial heterotrophs. This acceleration appears to follow the release of available organic carbon from one or more copper-sensitive components of the original ecosystem. Ultimately, the bacterial survivors, which demonstrate an increased tolerance to copper with time, reciprocate by providing a source of plant nutrients suitable for the establishment of succeeding phytoplankton regimes. (Katz)
W77-06622

EFFECTS OF FOUR OILS ON MARINE BACTERIAL POPULATIONS: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
R. E. Hodson, F. Azam, and R. F. Lee.
Bulletin of Marine Science, Vol. 27(1), p. 119-126, 1977. 2 tab, 2 fig, 20 ref.

Descriptors: *Marine bacteria, *Microorganisms, *Oil wastes, *Oil pollution, *Water pollution effects, *Toxicity, Mortality, Resistance, On-site data collection, Carbon radioisotopes, Chemical analysis, Organic compounds.
Identifiers: Controlled experimental ecosystem, Processed oil, Crude oil, Tolerance, Glucose, Mineralization, Total hydrocarbon concentration.

During the August, 1974 CEPEX (Controlled Ecosystem Pollution Experiment) hydrocarbon experiment, the effects of four oils (Louisiana crude, Kuwait crude No. 2 fuel oil, and Bunker C oil) on heterotrophic uptake and mineralization of D-glucose-14C by 1 microgram-filterable microbial populations from Saanich Inlet, British Columbia, Canada, were examined. The four oils inhibited D-glucose uptake and mineralization; the degree of inhibition was dependent upon both the oil type and concentration. The two processed oils were more toxic than the two crude oils tested. Low concentrations (e.g. 80 micrograms/l) of Bunker C oil stimulated bacterial metabolism. Populations exposed to 10 micrograms/l of No. 2 fuel oil for 30 days in CEE enclosures did not acquire oil tolerance. Neither the potential for oxidation of 14C-labeled hydrocarbons nor the total bacterial density was enhanced by one-month's exposure to 10 micrograms/l of No. 2 fuel oil. These data suggest that concentrations of these oils in seawater above 300 micrograms/l can significantly inhibit marine bacterial activity. (Katz)
W77-06623

EFFECTS OF COPPER ON PHYTOPLANKTON STANDING CROP AND PRODUCTIVITY: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. H. Thomas, O. Holm-Hansen, D. L. R. Siebert, F. Azam, and R. Hodson.
Bulletin of Marine Science, Vol. 27(1), p. 34-43, 1977. 1 tab, 10 fig, 27 ref.

Descriptors: *Copper, *Heavy metals, *Toxicity, *Mortality, *Water pollution effects, Phytoplankton, Productivity, Standing crops, Growth rates, Carbon radioisotopes, Photosynthesis, Food chain.
Identifiers: *Controlled experimental ecosystem.

Two experiments were performed in which copper was added to seawater and its associated plankton enclosed in plastic containers moored in Saanich Inlet, British Columbia. In the first experiment (10 and 23 to 50 microgram/l copper) phytoplankton crops, photosynthesis, and growth rates were initially inhibited by copper. Excretion of 14C-labelled organic matter was high in copper-treated populations. Initial inhibition was followed by recovery of the phytoplankton crops and of photosynthesis so that, at the end of the experiment (27 days), values were similar to those in untreated control enclosures. There were no significant differences in the particulate carbon:nitrogen or carbon:phosphorus ratios between the control and test enclosures, indicating that copper did not change the gross chemical composition of the phytoplankton. In the second experiment (5 and 10 microgram/l copper), copper seemed to increase the algal standing crops, but not the rate of photosynthesis, over levels in the control enclosure. The lack of inhibitory effects of copper might have been because the crop at the time of copper addition consisted mostly of microflagellates which were the copper-resistant algae noted in the first experiment. The slight increase in plant biomass in treated CEEs was, however, most likely due to inhibition of zooplankton which would result in reduced grazing pressure on the algal crops. (Katz)
W77-06624

EFFECTS OF COPPER ON THE DOMINANCE AND THE DIVERSITY OF ALGAE: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. N. Thomas, and D. L. R. Seibert.
Bulletin of Marine Science, Vol. 27(1), p. 23-33, 1977. 10 figs, 2 tabs, 15 ref.

Descriptors: *Copper, *Heavy metals, *Water pollution effects, *Path of pollutants, Diatoms, *Phytoplankton, Marine algae, Dinoflagellates, *Biomass, Toxicity, Mortality, On-site data collections, Bioassay.
Identifiers: *Controlled experimental ecosystems, Microflagellates, Centric diatoms, Pennate diatoms, Diversity.

Two experiments were performed in which copper was added to plastic experimental enclosures (CEEs) moored in Saanich Inlet, British Columbia. In the first experiment, copper was added 1 day after mooring at concentrations of 10 and 50 micrograms per liter copper. Ten days later, populations of centric diatoms, Chaetoceros sp., declined as a proportion of the crop in copper treated enclosures. These populations were replaced by copper-insensitive algae (microflagellates, Nitzschia delicatissima and Navicula distans). Taxonomic diversity declined in both control and treated enclosures, but was very much lower in copper treatments. Biomass diversities also declined, but the differences between control and treated enclosures were not significant. In the second experiment, copper was added 10 days after the start at concentrations of 5 and 10 mg/l copper. Before copper addition diatoms declined proportionally and were replaced by microflagellates. Thereafter, in the control enclosure, the proportion of centric diatoms and dinoflagellates increased. Copper treatment resulted in low proportions of centric diatoms and the complete absence of dinoflagellates 4 days after copper treatment. The remaining population consisted mainly of pennate diatoms, of which Nitzschia d. was prominent. Taxonomic and biomass diversity declined in all enclosures prior to copper treatment; copper treatment in this experiment did not result in significant changes in either diversity measurement. These studies provide data substantiating the hypothesis that certain algae will predominate over others when pollutants are introduced into the sea. (Katz)
W77-06625

TEMPERATURE, SALINITY AND LIGHT PENETRATION STRUCTURES: CONTROLLED ECOSYSTEM POLLUTION EXPERIMENT,
British Columbia Univ., Vancouver. Inst. of Oceanography.
M. Takahashi, and F. A. Whitney.
Bulletin of Marine Science, Vol. 27(1), p. 8-16, 1977. 11 figs, 15 ref.

Descriptors: *Water temperature, *Salinity, *Light penetration, *Euphotic zone, Stratification, On-site data collection, Physical properties,

*Marine microorganisms, Cycling nutrients, Diatoms, Zooplankton, Phytoplankton, *Sea water.
Identifiers: *Controlled experimental ecosystems, *Pelagic ecosystems.

Temperature, salinity, and light penetration profiles were taken frequently during eight separate experiments in 0.25-scale controlled experimental ecosystems (CEEs), each lasting approximately 1 month, and one experiment in full-scale CEEs, lasting 2.5 months. In both scale CEEs, the temperature profiles showed similar temporal changes to those of the outside waters. Initial salinity structures were maintained throughout the experiment, except for some modification by rain and wave action, while that outside changed due to estuarine and tidal activity as well. In the 0.25-scale CEEs, waves promoted vertical mixing and, in the top 5 to 7 m, occasionally caused water exchange. The water column in the full-scale CEEs was highly stratified, preventing some organisms and regenerated nutrients from being advected into the euphotic zone. The floats and plastics of the CEEs reduced direct solar energy up to 50% and diffused the incident light. (Katz)
W77-06626

LOCH EWE BAG EXPERIMENT, 1974,
Marine Lab., Aberdeen (Scotland).
J. C. Gamble, J. M. Davies, and J. H. Steele.
Bulletin of Marine Science, Vol. 27(1), p. 146-175, 1977. 5 tab, 25 figs, 46 ref.

Descriptors: *On-site data collections, *Methodology, *Primary production, Carbon radioisotopes, Water temperature, Salinity, *Copper, *Heavy metals, Larvae, Benthic fauna, Phytoplankton, Zooplankton, Marine biology, *Cycling nutrients.
Identifiers: *Controlled experimental ecosystems, *Lock Ewe(Scotland).

The study of planktonic ecosystems in large plastic enclosures (bags) elucidates the effects of a range of factors including different rates of nutrient enrichment, variations in predator numbers, and additions of copper to the system. Differences in rates of nutrient enrichment alter the rate of primary production without greatly altering phytoplankton biomass. Variations in population structure of the phytoplankton and in herbivore biomass appear to result from differences in predator numbers. The effects of natural stresses appear similar to those induced by a pollutant. (Katz)

STABLE ELEMENTS OF RADIOECOLOGICAL IMPORTANCE IN CERTAIN ECHINODERM SPECIES,
Democritus Nuclear Research Center, Athens (Greece). Chemistry Dept.
C. Papadopoulou, G. D. Kanias, and E. Moraitopoulou-Kassimati.
Marine Pollution Bulletin, Vol. 7(8), p. 143-144, 1976. 2 tab, 1 fig, 14 ref.

Descriptors: *Radioecology, Neutron activation analysis, *Radio-chemical analysis, Radioisotopes, *Radioactive wastes, *Path of pollutants, Water pollution sources, Marine animals, Bioindicators, Public health, Benthos, Trace elements, Pollutant identification, Spectroscopy.
Identifiers: *Echinoderms, Gamma-ray spectroscopy, *Marine ecosystems.

Echinoderms may present variations in their elementary composition according to the surrounding medium and to their food sources. The accumulation of certain trace elements by these organisms is of radioecological interest, besides the biological one. The elements cobalt, zinc, chromium, caesium, silver, tin, iron, rubidium, selenium and scandium were determined in seven echinoderm species by neutron activation analysis and gamma-ray spectroscopy. The calculated values of the concentration factors of the determined elements are reported and discussed from the radioecological point of view. (Katz)

AN OFFSHORE BIOMONITORING SYSTEM FOR CHLORINATED HYDROCARBONS,
Southern California Coastal Water Research Project, El Segundo.
D. R. Young, T. C. Heesen, and D. J. McDermott.
Marine Pollution Bulletin, Vol. 7(8), p. 156-159, 1976. 4 figs, 17 ref.

Descriptors: *Mussels, *DDT, *Polychlorinated biphenyls, *Chlorinated hydrocarbons, *Bioindicators, On-site data collections, Industrial wastes, Water pollution effects, Path of pollutants, Bottom sediments, *Methodology, Bioassay, Biochemistry, *Monitoring, Pollutant identification.
Identifiers: *Mytilus californianus, Taut-line buoy system, Submarine outfalls.

Uncontaminated intertidal mussels transferred to a tautline buoy system near a major submarine outfall off southern California proved to be useful bio-indicators of water column contamination. Mussel survival exceeded 90%, and specimens maintained for 13 weeks near the polluted bottom (35m) and the sea surface accumulated DDT above control concentrations by factors of 200 and 20, respectively. Corresponding factors for PCB were 60 and 6. (Katz)

PETROLEUM HYDROCARBONS FROM EFFLUENTS: DETECTION IN MARINE ENVIRONMENT,
Hunter Coll., New York. Dept. of Environmental Health Sciences.
J. T. Tanacredi.
Journal of the Water Pollution Control Federation, Vol 49, No 2, p 216-226, February 1977. 7 fig, 5 tab, 32 ref.

Descriptors: *Pollutant identification, *Oil wastes, *New York, *Water pollution sources, *Marine biology, *Oil pollution, *Waste water(Pollution), Benthos, Analytical techniques, Aquatic life, Fluorescence, Spectroscopy, Chromatography, Chemical analysis, Instrumentation, Oil, Water pollution, Oily water, Effluents, Pollutants, Organic compounds.
Identifiers: *Petroleum hydrocarbons, *Marine environments, *Crankcase wastes, *Waste oil disposal, *Jamaica Bay(NY), Marine organisms, Crankcase oil.

Weekly samples from four wastewater treatment facilities discharging into Jamaica Bay were analyzed for the presence of waste crankcase petroleum products. Two novel ultraviolet-fluorescence spectroscopic techniques were utilized to exhibit qualitatively the presence of waste automotive petroleum hydrocarbons in each of the final effluents of water pollution control plants by comparison of sample 'profiles' to 'profiles' generated by standard oils. The surface waters and a benthic organism (Mya arenaria) residing in Jamaica Bay were also analyzed for petroleum hydrocarbons using these techniques. Ultraviolet-fluorescence spectroscopic analyses furnished dramatic evidence for the presence of a significant quantity of hydrocarbons associated with waste petroleum products in all samples collected. Gas chromatographic and mass spectroscopic analyses indicate petroleum contamination of mollusks. (Henley-ISWS)

APPLICATION OF LANDSAT TO THE SURVEILLANCE AND CONTROL OF EUTROPHICATION IN SAGINAW BAY,
Bendix Aerospace Systems Div. Ann Arbor, Mich.
R. H. Rogers.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-12434, Price codes: A02 in paper copy, A01 in microfiche. Report BSR 4201, October 1975. 11 p, 4 fig, 4 tab, 7 ref. NASA NAS5-20942.

Descriptors: *Remote sensing, *Water quality, *Lake Huron, Satellites(Artificial), *Mapping, Eutrophication, Nutrients, Chlorophyll, Phosphorus, Water temperature, Correlation analysis, Regression analysis, Data processing.
Identifiers: *LANDSAT, *Saginaw Bay(Mich).

Computer techniques developed for mapping water quality parameters from LANDSAT data were demonstrated, using ground truth collected in an ongoing survey of water quality in Saginaw Bay (Lake Huron), Michigan sponsored by the US Environmental Protection Agency. Chemical and biological parameters were collected at 27 bay stations in concert with LANDSAT overflights. Application on stepwise linear regression to 12 of these parameters and corresponding LANDSAT measurements resulted in relationships that can be applied to map any one of the 12 water quality parameters over the entire bay. The regression correlation coefficients varied from 0.99 for total phosphorus to 0.72 for chlorophyll a corrected. Five of the water quality parameters are best correlated with LANDSAT Band 6 alone. One parameter, temperature, relates to Band 5 alone, and only two bands are justified for mapping the remaining six parameters. (Sims-ISWS)

COMPUTER MAPPING OF LANDSAT DATA FOR ENVIRONMENTAL APPLICATIONS,
Bendix Aerospace Systems Div. Ann Arbor, Mich.
R. H. Rogers, J. B. McKeon, L. E. Reed, N. F. Schmidt, and R. N. Schecter.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-13551, Price codes: A02 in paper copy, A01 in microfiche. Report BSR 4206, November 1975. 17 p, 5 fig, 9 ref. NASA NAS5-20942.

Descriptors: *Remote sensing, *Mapping, *Land use, *Water quality, Satellites(Artificial), Data processing, Watersheds(Basins), Water pollution, Water pollution sources, Runoff, Sediments, Nutrients, Classification, Land classification, Forests, Cities, Urbanization, *North Carolina.
Identifiers: *LANDSAT, Triangle J Council of Government(NC).

LANDSAT computer compatible tapes were used as a basis for inventorying land cover within the Triangle J Council of Government's 1,750 sq mi study area. Ten land cover categories were interpreted for the study area at a detail of 0.44 hectares (1.1 acres). The study area included 3 urban density categories, 4 forest types, agricultural-managed lands, bare soil-construction sites, and water. The resulting products included color-coded overlays for each of the 10 categories for a

1:96,000 scale base map, a color composite map of the same categories and scale, and a computer tape containing 54 quadrangles (7.5 minute) where each 50 meter grid cell was coded as to the 10 land cover types. This taped data is being agrregated into 4 hectare (about 10 acres) grid cells and merged with soils and slope data to compute sediment and nutrient flows in the drainage areas. The complete inventory was accomplished with a period of 60 days at a cost of less than one cent per acre, a significant improvement in dollars and time over previously reported efforts. (Sims-ISWS)

Descriptors: *Arkansas, *California, *New York, *Connecticut, *Arizona, *Groundwater, *Water pollution, Water resources, *Monitoring, *Water quality, Water wells, Control systems, Data collections, Industrial wastes, Nitrates, Septic tanks, Salinity, Aquifers, Leachate, Cesspools, Chemical properties, Measurement, Water supplies, Oxidation lagoons.
Identifiers: *Brine disposal, Landfill leachate, Plating wastes contamination, Percolation ponds, Agricultural pollution.

This study was designed to show by example site-specific procedures for monitoring various classes of groundwater pollution sources. The first five case histories of actual or potential groundwater pollution were presented, including the monitoring techniques and their efficacy. The case histories cover brine disposal in Arkansas, plating waste contamination in Long Island, New York, landfill leachate pollution in Milford, Connecticut, an oxidation pond near Tucson, Arizona, and multiple-source nitrate pollution in the Fresno-Clovis, California, metropolitan area. The report concluded with hypothetical illustrative examples for developing and selecting monitoring alternatives based on a cost comparison between other alternatives and hydrologic judgment. The examples illustrated cover agricultural return flow, septic tanks, percolation ponds, and landfills. (Henley-ISWS)

Descriptors: *Reservoirs, *Plankton, *Biomass, *Measurement, *Variability, *Oklahoma, Euphotic zone, On-site investigations, Analytical techniques, Statistical methods, Pollutant identification.
Identifiers: *Lake Carl Blackwell(Okla), Melosira, Analysis of variance(ANOVA).

The assumption that planktonic biomass measurements at two nearby stations at the same euphotic zone depth would yield correlated data was tested in Lake Carl Blackwell, Oklahoma. The predominant diatom Melosira was used in the analysis of variance (ANOVA). The widest range in absolute values encountered were: 0.07-0.30 mg particulate nitrogen/1; 0.78-2.09 mg particulate carbon/1; 0.07-7.0 mg chlorophyll-a/cu m and 0-688 Melosira/ml. The only consistent pattern to emerge from two-way (ANOVA) is that station effects are an important variability source for Melosira. Three-wat (ANOVA) run with sampling time as an additional variable emphasized that for Melosira station site was a significant source but sampling time was not. However, interactions between samples and time of sampling and station and time of sampling were significant. In all three chemical parameters sampling time contributed a significant source of variability. Moreover, samples x time of sampling interaction was also significant in all cases. Chlorophyll-a and particulate nitrogen tended to increase with time. Sample effects and the samples x time of sampling interactions were significant in a three-way (ANOVA) for particulate carbon and particulate nitrogen. The test results are given as a guide to research planners. (Auen-Wisconsin)

Analytical determination of the chemical composition of water is discussed as well as the criteria for judging water quality as it is dependent upon the use of water. Water quality standards for domestic water use are particularly emphasized. A table is included which lists various contaminants and the amounts of each allowed by several countries around the world. Water quality management and monitoring is discussed. (Chilton-ORNL)

Four procedures which use 0.3 M HC1, pH 3 or pH 7 citrate-dithionite, or acetic acid-hydroxylmine solutions were evaluated with respect to their potential use in removing surface coatings from aquatic sediment particles. The 0.3 M HC1 extraction required fewer manipultions than the citrate-dithionite procedure, yielded approximately the same recovery efficiency with minimum structural degradation, and resulted in an easily analyzed solution. These advantages make the 0.3 M HC1 procedure preferable for routine use in monitoring the readily acid-soluble minor elements in aquatic sediments. (Chilton-ORNL)

A COMPREHENSIVE PLAN FOR THE GLOBAL INVESTIGATION OF POLLUTION IN THE MARINE ENVIRONMENT AND BASELINE STUDY GUIDELINES.
United Nations Educational Scientific and Cultural Organization, Paris (France).
UNESCO, Intergovernmental Oceanographic Commission, Technical Series, No. 14, 1976. 42 p, 4 tab.

Descriptors: *Water pollution, *Baseline studies, *Resources development, *Environmental effects, Water pollution effects, Oceans, Pollutant identification, Monitoring, *Comprehensive planning.
Identifiers: *Outer Continental Shelf, Mass balance, Transfer processes, Marine pollution, Biogeochemical cycle, Pollution monitoring.

This report is an amalgamation of a document entitled 'A Comprehensive Plan for a Global Investigation of Pollution in the Marine Environment', and a document entitled 'Report of the IOC/ICES Working Group on Baseline Study Guidelines', as amended by the IOC Executive Council at its seventh session in Bergen, June 1976. The GIPME Comprehensive Plan provides an international framework within which national and regional programs on various aspects of marine pollution may be coordinated to contribute to an understanding of global pollution problems. The ultimate objective of a comprehensive investigation of marine pollution is to provide a sound scientific basis for the assessment and regulation of the pollution problem, including sensibly planned and implemented monitoring programs. Equal priority is given to a number of research activities dealing with inputs, pathways, sinks, effects and dose/response reltionships. Baseline studies will provide valuable data on inputs, distributions and pathways, and to some degree will help the mass-balance studies. (Sinha-OEIS)

Identifiers: *Sensors, Water monitor systems.

The National Aeronautics and Space Administration has undertaken the task to develop an automatic water quality monitoring system that can assure conformance to projected high effluent quality standards and result in an increase and acceleration in the practice of reclamation and reuse of water. The objective of this water quality monitoring program was to develop a system which includes the necessary sensors, sample collection system, and data acquisition and display system to monitor in 'real time' the effluent discharge from waste treatment plants and to provide the data which determines the quality of the wastewater. The WMS (water monitor system) was installed in a mobile trailer which houses the DAS (data acquisition system), sensors, sample conditioning/distribution system, and the report generation system. The system can be integrated with a maximum of 40 water quality sensors. The major elments which comprise the WMS were described. (Sims-ISWS)

IDENTITY, ORIGIN AND DEVELOPMENT OF OFF-FLAVORS IN GREAT LAKES ANADROMOUS FISH,
Wisconsin Univ.-Madison.
R. C. Lindsay.
Wisconsin Department of Natural Resources, Madison Completion Report for Project AFC-13, for the period July 15, 1974 to June 30, 1976, February 1977. 7 p. PL-89-304, Proj AFC-13.

Descriptors: *Oil pollution, *Pollutant identification, Wisconsin, Great Lakes, *Anadromous fish, Lake Michigan, Fish, *Salmon, Aromatic compounds, *Taste, *Organoleptic properties, Polychlorinated biphenyls.
Identifiers: Phthlate esters, *Aromatic hydrocarbons, Volatile compounds, *Flavors(Fish).

The principal effort has been directed towards the chemical identification of volatile compounds present in Great Lakes salmon and environmentally related materials. Volatile compounds were collected from samples using vacuum and atmospheric steam distillations with subsequent ether extractions. Aroma concentrates obtained from the recovery procedures were subjected to high resolution gas chromatographic analysis and mass spectrometry. Compounds with potent and distinctive odors and/or structures which indicated that the substances were different from those routinely encountered in most foods were identified. The occurrence of a number of aromatic hydrocarbons along with the aliphatic even-carbon numbered hydrocarbons would strongly suggest salmon pick-up of oil or petroleum-based product contamination materials. The identification of polychlorinated biphenyl compounds indicates that compounds of relatively low degrees of chlorination are currently present in salmon along with other compounds exhibiting greater chlorination of the biphenyl ring system. (NOAA)

BLANK AND SALINITY CORRECTIONS FOR AUTOMATED NUTRIENT ANALYSIS OF ESTUARINE AND SEA WATERS,
New Hampshire Univ., Durham.
T. C. Loder, and P. M. Glibert.
Sea Grant Program Report No. UNH-SG-JR-101, Dec 1976. 32 p, 8 fig, 6 tab, 34 ref. Also as: Woods Hole Oceanographic Inst. Contribution No. 3897. SG-4-2037 R/EM-2.

Descriptors: *Estuaries, *Sea water, *Nutrients, *Salinity, Measurement, *Pollutant identification, Methodology, Analytical techniques.

Routine measurements of dissolved micronutrients in sea water are performed by numerous laboratories using a Technicon Auto Analyzer II System. The methods employed are generally the Technicon Industrial Methods with various modifications. Experimentation has shown, however, that there are some problems with these methods in the determination of blanks, which can cause significant errors in estuarine or sea water samples. The blank problems result from: (1) the index of refraction of the sea water sample, (2) reaction products of various wetting agents and sea water, (3) the absorbance of colored substances in the sample, either particulate or dissolved, and (4) the salt error or variable production of reaction products of the nutrient in the sample and the color reagents as a function of sample salinity. In this paper several methods are recommended for determining the blank and salt correction factors. The method to be used depends on the nature of the samples (fresh, estuarine or sea water) and the nutrient being analyzed. (NOAA)

ADENOSINE TRIPHOSPHATE (ATP) LEVELS IN MICROBIAL CULTURES AND A REVIEW OF THE ATP BIOMASS ESTIMATION TECHNIQUE,
Canada Centre for Inland Waters, Burlington (Ontario).
A. A. Qureshi, and J. Patel.
Scientific Series No. 63, 1976, 33 p., 9 fig., 10 tab., 101 ref., append.

Descriptors: *Bacteria, *Fungi, *Biomass, Analysis, Microorganisms, Assay, Technology, *Pollutant identification, Analytical techniques, Bioassay, Reviews, Cultures, Microbiology, Estimating.
Identifiers: *Adenosine triphosphate.

In laboratory-grown cultures of a lake bacterium and three lake fungi, the concentration of cellular ATP was found to vary appreciably during the various stages of growth. Generally, the highest level of ATP was observed during the lag and early log growth phases. Thereafter, the ATP concentration rapidly decreased and stabilized at a relatively constant level during the stationary phases of the growth cycle. With respect to the use of the Du-Pont Biometer for ATP determinations, it was observed that after calibration and strict adherence to procedure during analysis, relatively consistent results could be obtained with both standard ATP solutions and test solutions. Of the various solvents examined for determining the stability of the standard ATP, boiling Tris-HCl buffer (0.02M, pH 7.75) was the best solvent. This solvent also proved to be highly satisfactory for the extraction of ATP from bacterial and fungal cultures used in this investigation. The report also provides background information on the ATP biomass estimation technique, general remarks on the technique, and an extensive bibliography of its use and application in diverse systems. Geological Survey, Lakewood, Colo. Water Resources Div.
W. R. White, and J. A. Leenheer.
Journal of Chromatographic Science, Vol 13, p 386-389, August 1975. 3 fig, 1 tab, 21 ref.

Descriptors: *Chemical analysis, *Acids, *Aqueous solutions, *Gas chromatography, *Analytical techniques, Waste disposal, Injection wells, Path of pollutants, Groundwater movement, Sampling, Water wells, *Pollutant identification.
Identifiers: *Formic acid, *Acetic acid, *Flame ionization detector.

Formic and acetic acids in aqueous solution are analyzed by gas chromatography using the flame ionization detector. A specially conditioned four-foot glass column packed with Porapak Q coated with 3% phosphoric acid is used. The lower detectable limits for formic and acetic acids in solution are 100 micrograms respectively. By combining steam distillation and concentration steps, concentrations of 1.0 mg/liter of formic acid and 0.03 mg/liter of acetic acid can be measured. (Woodard-USGS)

CHARACTERIZATION OF SOLUBLE ORGANIC MATTER IN LEACHATE,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. K. Chian, and F. B. DeWalle.
Environmental Science and Technology, Vol 11, No 2, p 158-162, February, 1977. 4 fig, 2 tab, 26 ref.

Descriptors: *Pollutant identification, *Leachates, Analysis, Physical characteristics, Chemical characteristics, *Filtration, Membranes, *Organic matter, *Chromatography, Lipids, Separation techniques, Water pollution, Groundwater.
Identifiers: Organic matter analysis, Membrane ultrafiltration.

Membrane ultrafiltration, gel permeation chromatography, and specific organic analyses were used to determine the composition of unknown major organic fractions in leachate. Results indicated that a major fraction of organics permeated a 500-MW membrane in ultrafiltration and most were present as free volatile fatty acids. The second largest fraction was a fulvic-like material with relatively high carboxyl and aromatic hydroxyl group density. A high-molecular-weight, humic carbohydrate-like complex, with a significant amount of hydrolyzable amino acids, was a small percentage of the organics. In tests, 75% of organic mater was identified. Lipids associated with the high-molecular-weight humic fraction were indicated by solvent extraction. Aromatic hydroxyl compounds were extracted with butanol. Data indicated that universal bacterial processes might govern the character of naturally occurring organics. (Collins-FIRL)

FORMS OF SULFUR IN SEWAGE SLUDGE,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
L. E. Sommers, M. A. Tabatabai, and D. W. Nelson.
Journal of Environmental Quality, Vol 6, No 1, p 42-46, January-March, 1977. 7 tab, 21 ref.

Descriptors: *Pollutant identification, *Sulfur compounds, *Sludge, Analysis, Heavy metals, Carbon, Nitrogen, Phosphorus, Cadmium, Organic wastes, Waste disposal, Inorganic compounds, *Sewage sludge.

An analysis was undertaken to determine the forms and amounts of organic and inorganic components of elements composing sludge. Bulk sludge samples from eleven Indiana treatment plants were subjected to gravimetric and titrimetric determinations, to a modified semimicro-Kjeldahl procedure, and to steam distillation, acidimetric titration, colorimetric determination, and various metal analyses. The samples were from plants using anaerobic digestion and either activated sludge or trickling filter secondary treatment procedures. It was found that total sulfur ranged from 0.7-2.1% and that 1-27% of this was inorganic sulfur extractable with 0.1M LiCl. Sulfur was composed of sulfide sulfur (less than 1 to 35%), inorganic nonsulfate sulfur (18-53%), carbon-bonded sulfur (18-56%), ester sulfate sulfur and inorganic sulfate sulfur (0-35%), and unidentified organic sulfur (0-42%). These forms were found to vary with time and no consistent relationships were found between the amounts of organic carbon, nitrogen, sulfur and phosphorus in the sludges. It was determined that the amounts of lead and zinc were significantly correlated with sulfide sulfur, as was cadmium with organic sulfur, ester sulfate sulfur, and 0.1M LiCl extractable sulfur. No such relationships were found for other metals and various sulfur fractions. (Collins-FIRL)

DRUGS AND DRUG METABOLITES AS ENVIRONMENTAL CONTAMINANTS: CHLOROPHENOXYISOBUTYRATE AND SALICYLIC ACID IN SEWAGE WATER EFFLUENT,
Veterans Administration Hospital, Kansas City, Mo.
C. Hignite, and D. L. Azarnoff.
Life Sciences, Vol. 20, No. 2, p 337-342, January, 1977. 1 fig, 1 tab, 9 ref.

Descriptors: *Water pollution sources, *Chemical analysis, *Analytical techniques, *Pollutant identification, Waste identification, Sewage effluents, Potable water, Gas chromatography, Mass spectrometry, Waste water treatment.
Identifiers: Drugs, Metabolites, Salicylic acid, 2-(4-chlorophenoxy)-2-methylpropanoic acid(CPIB).

Effluent of the Big Blue River Sewage Treatment Plant, Kansas City, Missouri, was analyzed to determine the content of drugs or drug metabolites. Composite 24-hour samples were collected and extracted under acidic, neutral, and basic conditions with methylene chloride. The extracts were screened by gas chromatography-mass spectrometry. Results indicated the presence of 2-(4-chlorophenoxy)-2-methylpropanoic acid (CPIB), the active metabolite of clofibrate, a hypolipidemic drug; and 2-hydroxy benzoic acid (salicylic acid), a metabolite of aspirin. Average 24-hour discharges of CPIB from August, 1975 to May, 1976 were 2.1 kilograms/day and salicylic acid discharges for the same period were 8.64 kilograms/day. Concentrations in raw sewage for CPIB were 2.8 kilograms/day. Raw sewage concentrations of salicylic acid were much higher and a 90% removal of this metabolite was shown from the data. Neither compound was detected in drinking water. Further investigations for drugs in water were suggested. (Collins-FIRL)
W77-07045

THE CHEMICAL CHARACTERISTICS OF THE CITY OF WINNIPEG WASTE WATER,
Winnipeg Waterworks, Waste, and Disposal Div. (Manitoba).
W. D. Carroll, and P. C. Lee.
Chemistry in Canada, Vol. 29, No. 1, p 14-17, January, 1977. 3 fig, 8 tab.

Descriptors: *Pollutant identification, Analysis, *Monitoring, *Chemical properties, Sludge treatment, Sewage treatment, Treatment facilities, Activated sludge, Oxygen, Oxidation lagoons, Heavy metals, Organic matter, Nutrients, Biochemical oxygen demand, Domestic wastes, Industrial wastes, Waste water treatment, *Canada.
Identifiers: *Winnipeg(Canada).

The City of Winnipeg, Canada, uses a conventional sewage treatment plant, a pure oxygen activated sludge plant, and conventional stabilization ponds to provide secondary treatment of waste water. Industrial wastes are about 35% of the 55 mgd influent volume at the conventional plant. The oxygen activated sludge plant has an inflow of 10 mgd, which is primarily domestic sewage. The lagoon system handles about 5 mgd of domestic sewage in three primary cells. The city monitors treatment by characterizing the levels and variations of organics, nutrients, and heavy metals loadings. Analyses are made of suspended solids, grease, BOD, TOC, NH3, NO3, TKN, total phosphorus, copper, nickel, zinc, chromium, lead, and cadmium. TOC was used as a tool for predicting BOD in raw waste water because it provides a close approximation of potentially oxidizable carbonaceous content of samples. Nutrient levels of sewage with a significant industrial component were bout equal to that of raw waste water. Chromium, zinc, lead, and nickel levels from industrial sources probably could be reduced to levels equal to that of domestic sewage. About 50-85% of the metal content ended up in the sludge, except for nickel which is removed at much lower rates. The metal content of effluents was low when compared to drinking water criteria. These analyses provide some data needed to assess the character and extent of contaminants, and the most cost-effective approach to control them. (Collins-FIRL)

ESCHERICHIA COLI AS A SANITARY-INDICATOR MICROORGANISM, (IN RUSSIAN),
G. G. Mirzoev.
Gig Sanit 1, p 86-88, 1976.

Descriptors: *E coli, *Bioindicators, *Microorganisms, *Pollutant identification, Public health, Human diseases, Epidemiology.
Identifiers: Pathogenic microorganisms.

E. coli is not considered a suitable index for the sanitary evaluation of water, milk, milk products and other food products. E. coli is ubiquitous; its presence does not indicate fecal contamination since it makes up only 2-3% of the fecal microflora. A 5 yr analysis of sanitary microbiological laboratories showed 2.3 and 9.3% deviations from coli-titer standards. No significant correlation was established between the coli-titer and the epidemiological state of an area, even in a case of dysentery. Sanitary microbiological studies should be directed at the detection of carriers of pathogenic microorganims and workers with chronic disease at water works, in the milk and

meat industry, and in other food-related jobs.--Copyright 1977, Biological Abstracts, Inc.

QUANTITATIVE ANALYSIS OF ENTEROVIRUSES IN WATER WITH VARIOUS DEGREES OF POLLUTION, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR). Dept. of General Hygiene.
V. I. Zotova, and L. A. Myshlyaeva.
Gig Sanit 3, p 63-65, 1976.

Descriptors: *Pollutant identification, *Adsorption, Resins, *Ion exchange, Water pollution, *Viruses, *Water analysis, Chlorination.
Identifiers: *Enteroviruses, Picornavirus, Poliovirus.

A test of the adsorption capacity of the ion-exchange resin AV-17 in the chemical method of virus concentrtion and the efficacy of the resin in quantitative analysis indicated that the adsorption capacity is inversely proportional to the degree of water pollution. The vaccine strain poliomyelitis virus LSC was used as a model. The use of conversion factors increased the accuracy of quantitative analysis of test water samples. Primary cultures of monkey kidney cells were used to assay the virus. In a practical application 67 water samples from open reservoirs and 80 sewage water samples were tested for degree of purification. Cytopathic agent composition in river water was 15-30 virus particles/l; untreated sewage water contained 980-2320 plaque forming units (PFU)/l, reduced to 660-1200 PFU/l by mechanical and biological purification and 100-350 PFU/l by chlorination.--Copyright 1977, Biological Abstracts, Inc.

WATER QUALITY INVESTIGATIONS IN THE SOUTH PLATTE RIVER BASIN, COLORADO, 1971-72.
National Field Investigations Center, Denver, Colo.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 912, Price codes: A12 in paper copy, A01 in microfiche. EPA Report 1972. 266 p, 30 fig, 17 ref, 9 append.

Descriptors: *Pollutant identification, *Water quality, Analysis, *Rivers, *Streams, Water pollution sources, Pollution abatement, Treatment facilities, Municipal wastes, Industrial wastes, Evaluation, *Colorado.
Identifiers: *South Platte River Basin(Colo).

Stream surveys were conducted of the South Platte River Basin (Colorado) to determine water quality changes since a survey in 1964-65. Surveys were made of Bear Creek, Clem Creek, Boulder Creek, St. Vrain Creek, the Big and Little Thompson Rivers, Cache la Poudre River, and the South Platte River. Twenty-three municipal waste treatment facilities were evaluated, as were industrial pollution sources. Developments in the control of industrial wastes since the earlier survey were evaluated as well. (Collins-FIRL)

CONCENTRATION AND DETERMINATION OF TRACE ORGANIC POLLUTANTS IN WATER,
Iowa State Univ., Ames.
R. C-Y. Chang.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 77-1019. PhD Thesis, 1976, 89 p.

Descriptors: *Pollutant identification, *Analytical techniques, *Trace elements, *Phenols, Chlorination, Oxidation, Resins, Anion exchange, Chemical reactions, Gas chromatography, Chlorides, Organic matter, Water treatment, *Waste water treatment.

A method was developed for concentrating and determining phenols in natural water, treated potable water and waste water. Determination was by selective sorption on a macroreticular anion-exchange resin and elution with acetone-water. Concentration was by evaporation after extraction with methylene chloride; measurements were performed by gas chromatography. The techniques used for preventing phenol loss due to chlorination, oxidation, and other reactions during determination were presented. Recovery was excellent for samples with model organic compounds of various classes added to water. Volatile and less volatile gas chromatographic compounds were determined. Removal of organic components in potable water was possible by this sorption method. A rapid method for determining and concentrating halomethanes in potable water was developed. (Collins-FIRL)

PARTICLE CHARACTERISTICS AND DISPERSAL PATTERNS OF SUGAR CANE WASTES IN SELECTED RIVERS AND ESTUARIES OF PUERTO RICO,
Puerto Rico Univ., Mayaguez. Water Resources Research Inst.
D. J. Morelock, and K. Grove.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 907, Price codes: A04 in paper copy, A01 in microfiche. Completion Report, February 1976. 45 p, 19 fig, 8 tab, 6 ref. OWRT A-042-PR(1).

Descriptors: *Sugarcane, Streams, Estuaries, Bays, *Organic wastes, Sediments, Carbon, *Puerto Rico, Sediment distribution, Dispesin, Path of pollutants, Water pollution sources, Rivers, Waste disposal.
Identifiers: Anasco River(PR) Anasco Bay(PR).

The lower 2.5 km of the Anasco River is an estuary. Salt wedge movement is dependent on river discharge. The average position is 1 km upstream. The river empties onto the narrow insular shelf of Anasco Bay. The shelf edge is marked by a line of submerged coral reefs 1.5 km. offshore. The salt wedge has a profound influence on sedimentation in the river. In the estuary, sediments are fine grained, poorly sorted clayey silt to silty sand. Above the estuary, there are coarser sands and gravel. The organic content of sediments below the sugar mill during production is over 90%. Downstream, organic content is low and the organic debris is much finer. The traction and siltation load and part of the suspension load is deposited at the salt wedge head and in the estuary due to floccultion at the mixing boundary. Sediments in the bay are derived from coral reefs, alluvial plain shore erosion and from the discharge of the river. These are mixed with relict sediments deposited during the lowered Wisconsin sea level. The two major facies are carbonate reef deposits and terrigenous sediments. Each of the facies and the distribution of organic debris can be correlated with the topography, current and wave patterns, and general physical characteristics of the shelf area. The results of the study indicate that estuaries are poor disposal sites for organic pollutants. Most of the wastes are deposited in the estuary and remain there for long periods. They are only partly removed during periods of high river discharge.

CHEMICAL QUALITY OF EFFLUENTS AND THEIR INFLUENCE ON WATER QUALITY IN A SHALLOW AQUIFER,
Los Alamos Scientific Lab., N. Mex.
W. D. Purtymun, J. R. Buchholz, and T. E. Hakonson.
Journal of Environmental Quality, Vol. 6, No. 1, p 29-32, January-February 1977. 2 fig, 4 tab, 5 ref. ERDA W-7405-ENG.36.

Descriptors: *New Mexico, *Water quality, *Alluvial aquifers, *Waste water disposal, Effluents, Water pollution sources, Chemicals, Aquifers, Data collections, On-site investigations, Evaluation, Storm runoff, Hardness(Water), Fluorides, Calcium, Carbonates, Sodium, Nitrates, Chlorides, Bicarbonates, Magnesium, Specific conductivity, Hydrogen ion concentration.
Identifiers: *Mortandad Canyon(NM), Dilution ratios, Total dissolved solids.

The chemical quality of liquid effluent released from an industrial waste treatment plant at the Los Alamos Scientific Laboratory controls the quality of water in a shallow aquifer in the alluvium of Mortandad Canyon. The dilution of the effluent with surface flow in the canyon reduces the concentrations of the chemicals as they move down gradient into the aquifer. Mass estimates of residual chemicals in solution in the aquifer average 1-6% of the total chemicals released to the canyon from 1963-1974. The average annual con-

centration of sodium, nitrate, chloride, and total dissolved solids in the aquifer through a 12-year period was directly correlated with annual average concentrations in the effluent. This relationship provides a means of predicting the impact of the chemical effluents on the quality of water in the aquifer. Chemical concentrations in solution in the aquifer have increased over prerelease levels; however, there has not been a steady accumulation of these materials in the water with time. The rapid loss of water and its associated chemicals from the aquifer prevents chemical accumulation and indicates that cessation of effluent release to the canyon would rapidly improve the quality of water in the aquifer. Descriptors: *Water pollution sources, *Oceans, *Atmosphere, *Trace elements, *Sampling, Rain water, Sea spray, Analytical techniques, Evaluation, Data collections, On-site investigations, Heavy metals, Foreign countries.
Identifiers: *North Sea, *Clyde Sea(Scotland), Dry deposits.

Samples of airborne dust, rainwater, and dry deposit were collected at five coastal stations in the United Kingdom, from a Gas Platform in the North Sea and at a coastal station in North Holland. Estimates were made of the atmospheric input of trace elements into the North Sea and Clyde Sea, and comparisons were made with the estimated content of these seas. It was shown that the atmosphere is a significant source for certain heavy metals and other trace elements. The estimates of dry deposit were generally less than half those for deposition by rain which, because the rain-collecting funnel was continuously exposed, includes a component of dry deposition. A maritime effect, expressed by increased concentrations of trace elements in rainwater collected in the presence of sea-spray, was discussed in an appendix and attributed to a massive enhancement of trace elements in the surface microlayer of the sea. An estimate of the amount of precipitation over the sea was also given and discussed in an appendix. (Humphreys-ISWS)

Descriptors: *Path of pollutants, Water pollution sources, Hogs, *Groundwater movement, Waste disposal, *Farm lagoons, Clays, *Farm wastes, *Seepage, Monitoring, Nutrients, Water tables, Bacteria, Drainage, *Virginia, Coastal Plains, Anaerobic conditions.
Identifiers: *Swine-waste lagoons, Soluble nutrients.

The effect of three anaerobic swine-waste lagoons on the quality of nearby ground water was investigated. The lagoons, in the Coastal Plain region of Virginia, were located on soils with high water tables and with varying drainage characteristics. Over a 14-month period in 1974 and 1975, ground water samples were taken from wells located at various depths and distances from the lagoons. These samples were analyzed to determine the extent of contamination due to the lagoons. The biological constituent analyzed was the number of fecal coliform bacteria; chemical constituents analyzed were concentrations of Cl, Cu, Mn, NH4-N, NO3-N, PO4-P, and Zn. Research findings showed that the quality of ground water was affected least around one lagoon constructed at ground level in a poorly drained soil with a clay subsoil. No ground water contamination was found more than 3 m from this lagoon. In contrast, ground water around two lagoons constructed with embankments above ground level, one in a sandy clay loam subsoil and the other in a sandy subsoil, showed traces of swine-waste components as far away as 30 m. Pollutant levels in ground water around the former lagoon were below U.S. Public Health Service drinking water standards, while pollutant levels around the latter lagoon exceeded those standards on many occassions. These experimental results indicate that seepage may occur from lagoons with embankments above ground level in sandy soil, and that biological sealing in such lagoons may not sufficiently protect shallow aquifers from contamination.

STUDY OF LEACHATE AT LANDFILL SITES 1975, VOLUME 1.
Holzmacher, McLendon and Murrell, Melville, N.Y.
Department of Environmental Control Publication, Suffolk County, New York, 1975. 131 p, 44 fig, 7 tab, append.

Descriptors: *Landfills, *Water pollution sources, *Monitoring, *Control systems, Data collections, Water wells, Groundwater, *New York, Solid wastes, Leachate, Leaching, *Path of pollutants, Pollution abatement.
Identifiers: *Leachate migration, Migration patterns, Suffolk, County, Long Island(NY).

Increasing population growth and eastward expansion in Suffolk County, coupled with recent evidence suggesting that leachate from landfill sites may endanger the quality of the ground water supply, have hastened the need for solid waste management studies on Long Island, New York. The hydrogeology of each landfill site was defined by the examination of local water well logs and Suffolk County hydrologic studies. Core borings provided data regarding the nature of the underlying material. Characteristics of leachate production and migration are fairly uniform for any given climate zone and composition of refuse. However leachate migrating from landfill often responds to hydrogeologic and fluid dynamic mechanisms not entirely understood. Because the migration path of the leachate plume is uncertain it is important that leachate from landfill be carefully monitored. Monitoring systems should be designed at each site so that vertical as well as aerial distribution of the leachate concentrations can be determined. This can be achieved by placement of observation wells screened at different depths. An additional monitoring safeguard of plotting and periodic testing of local, adjacent private water wells, was used to supplement the above monitoring system. By these methods the spread of leachate can be studied and a control program initiated. (Heiss-NWWA)

WASTE INJECTION INTO STRATIFIED GROUND WATER BODIES,
Hawaii Univ., Honolulu. Dept. of Geology and Geophysics.
F. L. Peterson, S. W. Wheatcraft, and D. L. Heutmaker.
Water and Sewage Works, Vol. 124, No. 1, p 60-65, January, 1977. 9 fig.

Descriptors: *Injection wells, *Waste water disposal, *Density stratification, *Saline water-freshwater interfaces, Mixing, Hydrologic models, Saline water intrusion, Ggoundwater, Water wells.
Identifiers: Ambient flow fields.

To study the mechanics of waste injection into a density-stratified ground water system, experiments were conducted utilizing a sand-packed hydraulic model; the system consisted of a freshwater lens overlying a saltwater body, with a zone of mixing separating the fresh and salt water. Rate of injection, injection depth in relation to the salt-fresh interface, length of injection well section, density of injected and ambient fluids, and ambient flow field strength were evaluated as to their effect on the mechanics of the injection process and ultimate fate of the injected waste effluents. Though several of these parameters, notably depth of injection, affected details of injection plume movement and shape, none of the parameters exerted any significant control on the ultimate fate of the plume; injection plumes always migrated well into the freshwater lens regardless of variations in parameters. There was little evidence of salt water entrainment in the plumes, suggesting the principal means of effluent plume movement to be mass displacement rather than mixing processes. (Eberle-NWWA)

INTERSTITIAL WATER CHEMISTRY OF ANOXIC LONG ISLAND SOUND SEDIMENTS. 1. DISSOLVED GASES,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics.
C. S. Martens, and R. A. Berner.
Limnology and Oceanography, Vol 22, No 1, p 10-25, January 1977. 8 fig, 4 tab, 46 ref. NSF 7002-AC2, GA 30288X; DES 75-06199.

Descriptors: *Water chemistry, *Bottom sediments, *Water analysis, *Methane, *Water quality, Analytical techniques, Chemistry, Sediments, Chemical analysis, Connate water, Gas chromatography, Gases, Nitrogen, Argon, Water properties, Sulfate, Salinity, Temperature.
Identifiers: *Dissolved gases, *Long Island Sound, *Methane content, Anoxic sediments, Methanogenic bacteria, Methane distributions, Microbial ecology.

Measurements of dissolved N2, Ar, CH4, and SO4(--) and salinity and temperature were used to examine the processes controlling their distributions in the interstitial waters of nearshore sediments. Where sulfate reduction is incomplete, dissolved N2 and Ar concentrations in the upper 10-30 cm appear to be controlled by macroinfaunal irrigation activities and to vary in accordance with overlying water conditions. Below 30 cm, N2 and Ar concentrations appear to have been last affected by August through October irrigation. In harbor sediments where sulfate reduction is complete at shallow depths, low N2 and Ar concentrations result from in situ stripping by methane bubbles. Methane concentrations remain below about 0.1 mM until about 90% of seawater sulfate is removed. As sulfate concentrations approach zero, methane builds up to bubble saturation. Concave-up methane depth distributions can be explained by methane consumption following first-order kinetics in the zone of sulfate reduction. Laboratory jar experiments with natural sediments indicated no methane production during sulfate reduction, which is in agreement with previous models and distribution studies of sulfate reducing and methanogenic bacteria in lake sediments. Combined laboratory and field results support the hypothesis that methane is produced mainly after sulfate is depeleted but is consumed within the sulfate reduction zone as it diffuses upward. PARTICULATE TRANSPORT OF RADIONUCLIDES 14C AND 55FE TO DEEP WATERS IN THE PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.
D. Lal, and B. L. K. Somayajulu.
Limnology and Oceanography, Vol 22, No 1, p 55-59, January 1977. 1 fig, 2 tab, 22 ref.

Descriptors: *Radioisotopes, *Sediments, *Pacific Ocean, Organic matter, On-site data collections, Oceans, Laboratory tests, Carbon radioisotopes, Iron, Carbon, Sediment transport, Sea water, Particle size, Oceanography, *Path of pollutants.
Identifiers: Calcareous particles, Sinking rates.

Observations during 1969-1971 indicated that radionuclides 14C and 55Fe in particulates in Pacific Ocean waters 28-31 deg N, 119-121 deg W up to depths of 2,500 m were transported from the surface within a short time (less than 10 yr). The mean downward sinking rates for 55Fe and 14C were deduced to be 0.0005 and 0.0025 cm/s. The appreciably faster transport of 14C is consistent with the fact that the mean size calculated for biogenic calcareous particles transporting 14C is larger than that for the 55Fe-labeled particles. (Sims-ISWS)

PHOSPHATE PREDICTION MODEL FOR STREAMS BY MEANS OF DISCRIMINANT ANALYSIS,
Cologne Univ. (West Germany). Geographisches Institut.
R. Herrmann, and W. Symader.
Hydrological Sciences Bulletin, Vol 21, No 3, p 397-406, September 1976. 2 fig, 6 tab, 14 ref.

Descriptors: *Phosphates, *Water pollution sources, *Forecasting, *Model studies, Streams, Foreign countries, Mathematical models, Analytical techniques, On-site data collections, Correlation analysis, Land use, Foreign research, Watersheds(Basins), *Path of pollutants.
Identifiers: *Discriminant analysis, *Germany, *Eifel Mountains(Germany).

An attempt was made to predict phosphate load by means of discriminant analysis. Eight groups of data were defined by a cluster analysis. Principal component analysis and an F-ratio of the predictor variables were used to find a most favorable groups of predictor variables by which an optimal separation between the eight different groups of data is possible. The discriminant functions, linear combination of the predictors, together with additional help of a classification procedure like Euclidic distances, may be used to assign an individual phosphate measurement to the group it best corresponds to. The discriminant analyses showed that a linear combination of 2 out of a total of 33 predictors, namely the combination of (1) runoff and (2) settlement area, has the best discriminant power. Multivariate tests of significance were performed. Tables were constructed that demonstrate the predicted versus actual group membership. Phosphate load and the predictor variables were measured from 1973 to 1974 in 21 streams draining basins with a variety of groundcovers (farm land, woods, and urbanized areas) in the Eifel Mountains and the bordering loess plains in Germany. LOSS OF 2,4-D IN RUNOFF FROM PLOTS RECEIVING SIMULATED RAINFALL AND

FROM A SMALL AGRICULTURAL WATERSHED,
Southern Piedmont Conservation Research Center, Watkinsville, Ga.
A. W. White, Jr., L. E. Asmussen, E. W. Hauser, and J. W. Turnbull.
Journal of Environmental Quality, Vol 5, No 4, p 487-490, 1976. 2 fig, 2 tab, 24 ref.

Descriptors: *Water pollution, *Pollutants, *Herbicides, *2,4-D, *Georgia, *Agricultural chemicals, Water quality, Water analysis, Water chemistry, Water pollution sources, Agricultural runoff, Small watersheds, Storm runoff, Subsurface runoff, Leaching, Rainfall, Soils, Agricultural watersheds, Chemical wastes, Pesticide residues.
Identifiers: Dissipation, Analytical procedures.

Movem4nt of 2,4-D (2,4-dichlorophenoxy) acetic acid) was not significant in either surface or subsurface runoff from a small agricultural watershed on a sandy herbicide application (0.56 kg/ha) each year, and initial concentrations were related to the time lapse between herbicide application and the date of the first runoff event. Maximum concentrations were 8.1, 6.2, and 2.5 micrograms/liter, in 1970, 1971, and 1972, respectively. The corresponding time lapse for the same years was 20, 27, and 34 days. Persistence studies showed that the 2,4-D concentration in the surface 0.5 cm of soil decreased 95%, from 4.7 to 0.23 ppm in only 7 days, and after 34 days, the soil concentration was only 0.01 ppm. Although subsurface flow was three times greater than surface runoff during the 3-year period, 2,4-D movement in subsurface water was negligible. Concentrations were usually zero or less than 1 microgram/liter. Soil sampled to a 90-cm depth showed no 2,4-D accumulation or buildup in the soil profile. Simulated rains (8.25 cm in 30 min) applied to subplots on the watershed showed that there is a potential for greater 2,4-D losses in surface runoff when it rains soon after herbicide application. When rains were applied 1, 8, and 35 days after herbicide application, the average 2,4-D concentrations in runoff were 25.2, 5.8, and 0.7 micrograms/liter, respectively. (Henley-ISWS)
W77-06908

THE IMPACT OF FERTILIZER USE AND CROP MANAGEMENT ON NITROGEN CONTENT OF SUBSURFACE WATER DRAINING FROM UPLAND AGRICULTURAL WATERSHEDS,
Agricultural Research Service, Coshocton, Ohio. North Appalachian Experimental Watershed.
F. W. Chichester.
Journal of Environmental Quality, Vol 5, No 4, p 413-416, October-December 1976. 2 fig, 3 tab, 13 ref.

Descriptors: *Nitrogen compounds, *Fertilizers, *Water pollution sources, *Agricultural chemicals, *Agricultural watersheds, *Ohio, Nitrates, Leaching, Water quality, Nitrogen, Ammonia, Nutrient removal, Nutrients, Water pollution, Land management, Hydrogeology, Groundwater, Soils, Watershed management, Fertilization.
Identifiers: *Nitrogen content, *Crop management practices, *Nitrate leaching, Soil drainage, Nitrogen forms, Nitrogen transport, Agricultural practices.

Spring flow and stream base flow sites were sampled weekly on, and adjacent to, a 123-ha agricultural watershed in the Allegheny-Cumberland Plateau physiographic region of east-central Ohio. Nitrogen content of samples was used to determine the influence of various N fertilizer and crop management practices on the quality of subsurface water draining from defined contributing areas. Measured nitrogen contents of spring flow were related to fertilizer N regime of the different agricultural practices investigated. Changes in land management on the area contributing to spring flow were reflected in changes in nitrogen content of water from that spring. The amount of nitrogen which was transported into the stream channel was directly related to seasonal variation in subsurface flow rate in two ways. First, the concentration of N in spring flow increased with an increase in the amount of water percolating through the overlying soil and shale. Second, the extent to which downstream quality was affected, i.e., the distance from the area of fertilizer application at which an increase in nitrogen content could be detected, also increased with the volume of flow from the springs. NUTRIENTS, CHLOROPHYLL, AND INTERNAL TIDES IN THE ST. LAWRENCE ESTUARY,
Laval Univ., Quebec. Department de Biologie.
J.-C. Therriault, and G. Lacroix.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 12, p 2747-2757, December 1976. 11 fig, 1 tab, 16 ref.

Descriptors: *St. Lawrence River, *Estuaries, *Tidal waters, Nutrients, *Chlorophyll, Tides, Currents(Water), *Water temperature, *Salinity, *Nitrates, *Dissolved oxygen, *Phosphates, On-site investigations, Data processing, Mixing, Circulation, Water circulation, *Path of pollutants, Water pollution.
Identifiers: *Laurentian Channel, *Internal tides, Internal oscillations.

Tide-dependent variations of temperature, salinity, dissolved oxygen, phosphate, nitrate, and chlorophyll a support the existence of internal tides (longitudinal and transversal) in the St. Lawrence estuary. Vertical oscillations of the poorly oxygenated and nutrient-rich intermediate and deep waters of the estuary have been documented at the head of the Laurentian Channel, the region in which the internal tides are thought to be generated. Penetration of intermediate waters (high-nutrient and low-oxygen concentrations) beyond the Laurential Channel associated with the internal tides and linked with an intense mixing process in the upstream region permits the nutrient enrichment of the surface waters and their eventual advection in the seaward direction. HIGH SEAS OIL POLLUTION: PARTICULATE PETROLEUM RESIDUES IN THE NORTH ATLANTIC,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
E. M. Levy, and A. Walton.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 12, p 2781-2791, December 1976. 9 fig, 5 tab, 15 ref.

Descriptors: *Oil pollution, *Atlantic Ocean, *Sampling, Surveys, Data processing, Water pollution sources, Oceans, Oil spills, Circulation, Ocean circulation, Ocean currents, Pollutants, Path of pollutants, Water pollution.
Identifiers: *Particulate petroleum residues, *North Atlantic, Tar.

The results of a continuing investigation into the occurrence and distribution of particulte petroleum residues on the surface of the North Atlantic were presented. From 1971 to 1974 more than 850 samples were collected from the North Atlantic on transects between the east coast of Canada and South America, the Caribbean, Baffin Bay and surrounding waters, the Labrador Sea, and the Azores. Repeated sampling was carried out in the Gulf of St. Lawrence and the region between Nova Scotia and Bermuda. The results indicated that the waters north of the Gulf Stream-North Atlantic Current system were virtually free from floating petroleum residues, while the waters of the Gulf Stream, Sargasso Sea, and Caribbean Sea were much more heavily polluted. Although concentrations as high as 91.8 mg/sq m were encountered, the general level of pollution was much less with tar contents in southern waters following a lognormal distribution with a geometric mean of 0.16 mg/sq m. The geographical distribution of tar is interpreted in terms of inputs from shipping and tanker traffic, and surface circulation patterns. (Sims-ISWS)

DISPERSION OF LIQUID WASTE FROM A MOVING BARGE,
Alabama Univ., Tuscaloosa.
J. Ball, and T. D. Reynolds.
Journal of Water Pollution Control Federation, Vol. 48, No. 11, p 2541-2548, November 1976. 8 fig, 3 tab, 7 ref.

Descriptors: *Waste disposal, *Barges, *Industrial wastes, *Oceans, Wastes, Disposal, *Waste dilution, Water pollution, *Dispersion, Ecological distribution, Sea water, Waste treatment, Water quality, Water pollution sources, Waste water disposal, Water analysis, Environmental sanitation, *Path of pollutants.
Identifiers: *Ocean dumping, Waste discharge, Discharge techniques, Dispersion phenomenon, Barge velocity.

Recent Environmental Protection Agency ocean dumping regulations required field investigations of the dispersion of liquid wastes behind moving barges. Data from two such studies, combined with ocean dumping data from previous work, available in the literature, permitted a re-evaluation of the dispersion phenomenon. Field data and the procedures used to collect it were presented. Data indicated that in all cases, the waste concentrations in the water followed a straight line on a log-log graph rather than first-order decay according to eddy diffusion theory. A general relationship was presented to describe the field data and included the effect of barge velocity and discharge rate. (Henley-ISWS)

FATE OF NITROGEN AND PHOSPHORUS IN SOILS UNDER SEPTIC TANK WASTE DISPOSAL FIELDS,
Agricultural Research Service, Beltsville, Md. Biological Waste Management Lab.; Agricultural Research Service, Beltsville, Md. Soil Nitrogen Lab.; and Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
L. J. Sikora, and R. B. Corey.
Transactions of the American Society of Agricultural Engineers, Vol. 19, No. 5, p 866-870, 875, September-October 1976. 4 fig, 35 ref.

Descriptors: *Nitrogen compounds, *Phosphorus compounds, *Septic tanks, *Water pollution sources, *Soil disposal field s, Nitrates, Leaching, Water quality, Nitrogen, Ammonia, Nutrient removal, Phosphates, Phosphorus, Disposal, Domestic wastes, Nutrients, Waste treatment, Hydrogen ion concentration.
Identifiers: *Waste disposal fields, Public health problems.

Probable nitrogen forms in soils under septic tank waste disposal fields were predicted by correlating observed soil moisture tensions with aeration status. The conditions beneath most waste disposal fields are sufficiently aerobic for nitrate to be the probable nitrogen form. The probable phosphorus form would depend upon many factors, including mineral content and pH of the soil. Due to high P concentration in septic tank wastes, both sorption and decomposition-precipitation reactions must be considered when determining P movement. Only in soils with little sorption capacity would the pollution potential of phosphorus from septic tank waste be considerable. (Henley-ISWS)

MISSISSIPPI SOUND TEMPORAL AND SPATIAL DISTRIBUTION OF NUTRIENTS,
Mississippi-Alabama Sea Grant Consortium, Ocean Springs, Miss. Gulf Coast Research Lab.
C. K. Eleuterius.
Report No MASGP-76-024, (1976). 63 p, 54 fig, 4 tab, 8 ref, append. SG-04-5-158-54.

Descriptors: *Estuaries, *Nutrients, *Baseline studies, *Resources development, *Environmental effects, *Water quality, Water resources, Mississippi, Effluents, Nitrates, Phosphates, Dredging, Construction, *Temporal distribution, *Spatial distribution, *Path of pollutants.
Identifiers: *Mississippi Sound.

Mississippi Sound, as estuarine system, is the eventual recipient of the accumulative effluents from activities throughout the drainage basin and is further altered by other direct actions such as dredging and construction. In order to assess the effect of present and future development on the water quality of the Sound, it is necessary to ascertain the existing regime of nutrients through determination of descriptive norms and causal relationships. A 'baseline' thus established serves as a reference to which perturbations in the nutrient levels can be compared to evaluate whether the level is a normal variation or an abnormality. The estuarine waters are the principal sources of the major elementary components of estuarine organisms: carbonate, phosphate and nitrate ions. While added amounts of phosphates and nitrates serve to increase the fertility of the estuary, excessive amounts result in algae blooms and accompanying anoxic conditions. Excessive nutrient levels result in degradation of water quality and are therefore used as indicators of pollution. One objective of the Mississippi Sound research effort was to ascertain the temporal and spatial distribution of nutrients. (NOAA)

REVIEW AND ANALYSIS OF HYDROGEOLOGIC CONDITIONS NEAR THE SITE OF A POTENTIAL NUCLEAR-WASTE REPOSITORY, EDDY AND LEA COUNTIES, NEW MEXICO,
Geological Survey, Albuquerque, N Mex. Water Resources Div.
J. W. Mercer, and B. R. Orr.
Open-file report 77-123, February 1977. 35 p, 7 fig, 1 tab, 36 ref.

Descriptors: *Radioactive waste disposal, *Surveys, *Underground waste disposal, *Aquifer characteristics, *Water quality control, *New Mexico, Reviews, Evaluation, Groundwater movement, Hydrogeology, Groundwater recharge, Nuclear wastes, Sites, Planning.
Identifiers: Eddy and Lea Counties(N Mex).

This interim report reviews and summarizes the hydrogeology of rocks associated with the Permian salt beds (Castile and Salado Formations) of Los Medanos area in southeastern New Mexico. The information will be considered, together with other factors, in the preparation of an analysis of the impact of a potential nuclear-waste repository on the environment. Most of the geologic units in and adjacent to the Permian salt deposits are characterized by low permeabilities and highly mineralized water. Sandstone of the Delaware Mountain Group, which underlies the salt, has an average hydraulic conductivity of 0.16 ft/d and an average porosity of 15.65 percent. Flow is north-northeastward toward the margin of the Capitan Limestone, at velocities ranging from 0.0005 to 0.0008 ft/d. The Capitan Limestone, a relatively high yielding limestone-reef aquifer adjacent to the study area, has transmissivity values ranging from 500 sq ft/d to 10,000 sq ft/d and an average hydraulic conductivity of about 5 ft/d. Water movement west of the Pecos River is northeastward in the reef, with discharge at Carlsbad Springs. East of the Pecos River, water moves at very low rates and the direction of movement is uncertain. The Castile and Salado Formations, which might be used to contain the nuclear waste, have a few isolated pockets of brine and gas, but generally transmit little or no ground water. (Woodard-USGS)

GEOLOGY AND GROUND WATER IN DOOR COUNTY, WISCONSIN, WITH EMPHASIS ON CONTAMINATION POTENTIAL IN THE SILURIAN DOLOMITE,
Geological Survey, Madison, Wis. Water Resources Div.
M. G. Sherrill.
Open-file report 77-61, February 1977. 92 p, 19 fig, 5 tab, 34 ref.

Descriptors: *Hydrogeology, *Water pollution sources, *Path of pollutants, *Groundwater movement, Groundwater resources, Water quality, Waste disposal, Agricultural chemicals, Industrial wastes, Municipal wastes, *Wisconsin.
Identifiers: Door County(Wis).

Door County, a recreational and fruit-growing area bordering Lake Michigan in northeastern Wisconsin, has had a long history of ground-water contamination from surface and near-surface sources. Contamination is most severe in late summer when fruit-canning operations and the influx of tourists create additional wastes. Silurian dolomite is the upper bedrock unit in the county and yields generally adequate supplies of very hard water with locally objectionable concentrations of iron and nitrate. Thin soil cover and well-fractured dolomitic bedrock give easy entry to ground-water contaminants throughout large parts of Door County. Many contaminants enter the dolomite by surface or near-surface seepage. There is little attenuation of contamination concentrations in the well-jointed dolomite, and contaminants may travel long distances underground in a relatively short time. The major source of ground-water contamination is bacteria, from individual waste-disposal systems, agricultural, industrial, and municipal wastes. Areas of the county underlain by contaminated zones include only a small percentage of the total ground-water system and are separated by large volumes of ground water free of contamination. (Woodard-USGS)

APPLICATION OF DIGITAL MODELLING TO THE PREDICTION OF RADIOISOTOPE MIGRATION IN GROUNDWATER,
Geological Survey, Menlo Park, Calif. Water Resources Div.
J. B. Robertson.
Reprint from: Isotope Techniques in Groundwater Hydrology 1974, Vol II, p 451-478, 1974: International Atomic Energy Agency, Vienna, Austria, 1974. 15 fig, 12 ref.

Descriptors: *Model studies, *Tracking techniques, *Path of pollutants, *Radioisotopes, *Groundwater movement, Digital computers, Radioactive wastes, Analytical techniques, Forecasting, Tritium.
Identifiers: Sr-90 movement in groundwater.

Recently developed numerical techniques have been adapted to the solution of transient radioactive solute migration problems in groundwater. The differential equations of groundwater movement are first solved by standard finite difference methods, then the differential equations of solute transport are solved by the method of characteristics. Validity of the simulation techniques is demonstrated for real examples of tritium, chloride and Sr-90 migration in groundwater at the National Reactor Testing Station, Idaho. This is probably the first documented field-verification of such a model that includes the effects of convective transport, two-dimensional dispersion, radioactive decay and ion exchange. Model results demonstrate the relative sensitivity of groundwater transport systems to various parameters, such as dispersion coefficients and ion-exchange distribution coefficients. The models can be very useful in predicting the behavior of natural isotopes, artificial tracers or waste in groundwater. The models allow variable hydraulic parameters in space and time, as well as variable chemical parameters. Predictive use of such models is demonstrated for several different conditions in heterogeneous basaltic aquifer. Thirty-year predictions of tritium and Sr-90 migrations are shown with variable hydraulic and chemical influences. Additional methods and potential applications of modelling are suggested, including tracer migration studies and natural isotope distributions in groundwater. (Woodard-USGS)

SEDIMENTS AND WATER QUALITY OF URBAN STORM WATER,
Middlesex Polytechnic, London (England).
J. B. Ellis.
Water Services, Vol. 80, No. 970, p 730-734, December, 1976. 4 fig, 10 ref.

Descriptors: *Storm runoff, *Urban runoff, *Water pollution sources, Heavy metals, Sediments, Oxygen demand, Surface runoff, Hydrology, Hydrogen ion concentration, Storm water, Water quality.
Identifiers: Silk Stream(London England).

The Silk Stream catchment, a tributary of the River Brent, in North London, was studied to gather information on the relatonship between sediments and water quality of urban storm water. Storm water runoff contains a substantial quantity of pollutants which can present a more serious problem than municipal wastes. Typical components of storm water are organic compounds, fecal bacteria, heavy metals, and suspended solids. Oils, phenols, detergents, and greases are other pollutants. Hydrogeologic and other characteristics of the area were studied. Storm water sediment composition is dominated by inorganic mineral fractions (45-70%) from roof, pavement, and street surfaces; also included are brick, glass, concrete, ash, bitumen, rubber-coated particles, minor amounts of plastics, aggregate, and metallic particles. These sediments are well sorted, spherical, and concentrated in the 0.1-0.5 millimeter range. Accumulated discharge of huge amounts of sediment in the receiving channels produces a very thick gelatinous benthal sludge. When these sludges are oil, grease, and detergent, flocs bubble to the surface. This bubbling and flotation are signs of decomposition, just as depressed pH and dissolved oxygen values indicate. Benthal sludges have a high ionic adsorptive capacity, mainly from inorganic matter in the sediment. Organic components increase the potential by decomposing to release complex, toxic compounds into surrounding sediments or by solutional release into the stream. There is a strong likelihood of coprecipitation of trae metals with these substances as well as with free iron oxides, rubber, and bitumen components. The use of sediment loads to upgrade nutrient rich waters, to take chemical species from the solution phase, or to remove these species, heavy metals, and organic compounds from the stream are all feasible water quality goals. (Collins-FIRL)

BIOGENIC ELEMENTS AND SULFATE REDUCTION IN WATER OIL CARBONATE LAYER, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Mikrobiologii.
E. P. Rozanova, V. N. Bykov, A. L. Baldina, and T. A. Kosogorova.
Mikrobiologiya 45(2), p 365-369, 1976.

Descriptors: *Sulfates, Oil, Bacteria, *Biodegradation, *Hydrogen sulfide, Carbonates, Salinity, Sediments.
Identifiers: *Biogenic elements, *USSR(Polaznensky deposit).

Biogenous sulfate reduction (bacterial) and accumulation of secondary H2S were caused by the action of pumping waters with a low mineral content on carbonate collectors with a high concentration of relict H2S during long periods of time. The amount of sulfates, phosphates and ammonium N in water from layers of various mineralization is sufficient for active sulfate reduction. Sulfates and phosphates are eliminated from rocks of layers with diluted waters. The maximum increase of SO42- in waters was 1545 mg/l, that of HPO42- was 0.34 mg/l. The amount of ammonium decreases with mineralization of the layer waters, remaining within the range of 129-7 mg/l. The content of CO2 and HCO3- increases in diluted waters to 197 and 695 mg/l, respectively, correlating with biogenous processes. The highest number of sulfate reducing bacteria (dozens of thousands of the cells per ml) was found in H2O with mineralization of 19 g/l. Curves for the content of SO42-, HPO42-, NH4+ and CO2 have a common maximum in waters of the Polaznensky deposit (USSR) with a salinity of 62 g/l.--Copyright 1977, Biological Abstracts, Inc.

ACCUMULATION OF HEAVY METALS IN SOILS FROM EXTENDED WASTE WATER IRRIGATION,
Pennsylvania State Univ., University Park. Dept. of Agronomy.
R. C. Sidle, J. E. Hook, and L. T. Kardos.

Descriptors: *Heavy metals, *Irrigation, *Soil contamination, Sewage effluents, Sewage disposal, Soil types, Waste water treatment, Copper, Zinc, Cadmium, Lead, Nickel, Cobalt, Metals, Vegetation, Food chains.

Accumulation and distribution of heavy metals due to waste water infiltration were investigated in soil profiles of a reed canarygrass and a corn rotation area. The soils were irrigated year-round with chlorinated secondary treated waste water effluent. Copper, zinc, cadmium, lead, nickel, and cobalt were studied. Effluent concentrations of these metals were in the lower range for heavy metals in waste water effluents given in previous studies. Extractable soil copper and zinc accumulated substantially at a depth of 0 to 30 centimeters in the reed canarygrass area, but cadmium levels in the surface foot of soil increased to a lesser degree. Copper was the only metal with a significant accumulation rate over time in the same depth range of the corn areas, and less than the copper concentration in the d canarygrass areas. No definite indications were found that the heavy metals moved from this depth range in either area and there were no definite accumulation trends with time for lead, nickel, or cobalt in either area. No serious soil contamination by these metals was indicated in either study area. Cadmium:zinc ratios approached that of the waste water applied in both cases, which was 0.68 to 1%. Further monitoring of heavy metal levels in the surface foot of soil and in vegetation would avoid possible food chain contamination. (Collins-FIRL)

PHOSPHATES IN SOILS TREATED WITH SEWAGE WATER: II. FRACTIONATION OF ACCUMULATED PHOSPHATES,
Agricultural Univ., Wageningen (Netherlands).
J. Beck, F. A. M. de Haan, and W. H. van Riemsdijk.
Journal of Environmental Quality, Vol 6, No 1, p 7-12, January-March, 1977. 2 fig, 4 tab, 24 ref.

Descriptors: *Phosphates, *Sewage disposal, Soil contamination, Sewage effluents, Organic matter, Inorganic compounds, Aluminum, Hydrogen ion concentration, Waste water treatment, Storage.
Identifiers: Sewage farms.

Investigations, using phosphate fractionation methods, were conducted on sewage farm soils to determine whether the chemical forms of phosphate accumulation in soil change with prolonged sewage water addition. Phosphate accumulation in soils flooded with sewage water for 30 and 50 years is mostly restricted to the upper 50 centimeters of soil. Phosphorus fractionation methods revealed that 15-20% accumulated in organic form. Most of the inorganic fraction was found in combination with aluminum or iron, and solubility relationship determinations indicated a possible precipitation of apatite-like compounds in soils with a nearly neutral pH. Aluminum combined phosphates were found to be prevalent. It was thought that phosphate retention is mostly governed by reactions with aluminum since the phosphate fractions distribution pattern remained practically the same during the lifetime of the sewage farm. Ultimate storage capacity of the soil for phosphate bonding is mainly determined by the presence of active aluminum compounds. (See also W77-07052 and W77-07054) (Collins-FIRL)
W77-07053

PHOSPHATES IN SOILS TREATED WITH SEWAGE WATER: III. KINETIC STUDIES ON THE REACTION OF PHOSPHATES WITH ALUMINUM COMPOUNDS,
Agricultural Univ., Wageningen (Netherlands).
W. H. van Riemsdijk, F. A. Westrate, and J. Beek.
Journal of Environmental Quality, Vol 6, No 1, p 26-29, January-March, 1977. 3 fig, 4 tab, 8 ref.

Descriptors: *Adsorption, *Phosphate, *Kinetics, Chemical reactions, Sewage effluents, Sewage disposal, Waste water disposal, Soil contamination, Chemical properties, Disposal.
Identifiers: Aluminum hydroxide.

The reaction of phosphate and aluminum hydroxide and alpha Al2O3 was studied in order to understand the kinetics of phosphate precipitation reactions in land disposal of raw sewage water. An initial phosphate concentration of 0.35 millimoles/liter at 20C was used. Sources of the phosphate were solutions of KH2PO4 and synthetic inorganic sewage water. Highest values of removed phosphate occurred when KH2PO4 solutions were used; this was attributed to the lack of competitive anions for adsorption. The ionic strength of this solution was lower and phosphate activities were much higher than in synthetic waste water. The mechanism of the reaction kinetics was similar with both adsorbent types used and was, possibly, influenced by the surface structure of the adsorbent. Characteristics of phosphate removal reactions were a first, fast adsorption on the surface of the adsorbent, and the formation of a solid aluminum phosphate phase. After 40 days, the reaction rate does not fit the presented first order equation. (See also W77-07052 and W77-07053) (Collins-FIRL)
W77-07054

SOLUBILITY AND PLANT UPTAKE OF CADMIUM IN SOILS AMENDED WITH CADMIUM AND SEWAGE SLUDGE,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
J. J. Street, W. L. Lindsay, and B. R. Sabey.
Journal of Environmental Quality, Vol 6, No 1, p 72-77, January-March, 1977. 8 fig, 4 tab, 34 ref.

Descriptors: *Cadmium, *Adsorption, *Solubility, *Soils, Physical properties, Chemical properties, Sludge, Alkalinity, Corn, Organic matter, Toxicity, Absorption.
Identifiers: Precipitation, Freundlich equation.

Adsorption and precipitation are investigated as controlling factors in cadmium concentration in soils. Factors studied, in addition to adsorption and precipitation, were plant uptake and chemical extraction of cadmium. The addition of soluble cadmium to soil produced a rapid removal of cadmium from solution by adsorption on to soil constituents and by the possible formation of solid phases of cadmium compounds. Solutions containing less than 50 micrograms of Cd(2+)/milliliter produced data which fit the empirical Freundlich equation in all soils. In alkaline sandy soils, high concentration cadmium precipitated, perhaps, as CdCO3 and Cd3(PO4)2. When added to soil, either alone or with sludge, cadmium was taken up by corn seedlings. Cadmium alone was more readily taken up by soil than the combination of cadmium and sludge. Organic matter in one test soil depressed cadmium uptake, possibly indicating a reduced availability of cadmium sorbed to organic matter. High levels of cadmium can be accumulated by corn seedlings without visual toxicity symptoms. The DTPA soil test method was useful in estimating the cadmium uptake by corn seedlings grown on cadmium-contaminated soils. (Collins-FIRL)

UNDERFLOW FROM SLUDGE-IRRIGATED CROPLAND,
Springfield Sanitary District, Ill.
R. C. Andrew, and A. P. Troemper.
Journal Water Pollution Control Federation, Vol 49, No 1, p 161-168, January, 1977. 1 fig, 10 tab.

Descriptors: *Irrigation, *Underflow, *Liquid wastes, Sludge digestion, Sludge disposal, Aerobic treatment, Drainage, Suspended solids, Biochemical oxygen demand, Leachates, Soil disposal fields, Soil contamination, Metals, Inorganic compounds, Organic matter, Nitrogen, Oxidation, Economics, *Illinois.
Identifiers: Springfield Sanitary District(IL).

The Springfield Sanitary District, Illinois, has instituted the use of cropland spray irrigation for liquid disposal of aerobically digested sludge. Two sites totaling 66 acres are used. They have permanent underdrainage systems which collect and pump the underflow back to the aeration tanks at the treatment plant. Data indicated underdrain water volumes were more parallel to rainfall than to applied sludge volumes. Soil filtration produced a 99.96% average BOD5 reduction and an 99.98% average suspended solids reduction. Average component levels were 0.9 milligrams/liter of BOD5, 5.6 milligrams/liter of suspended solids, and 1,179/100 milliliters of fecal coliform. The median pH was 7.1 for applied sludge and 7.0 for underdrain water; soil pH was basically unaffected. Small amounts of phosphates leached to underdrain water and phosphate removal averaged 98.5%. Enough iron, aluminum, and calcium were present to react with phosphates and make insoluble products which were held in the upper soil layers. Nitrogen was almost completely oxidized

LIBRARY U. OF I. URBANA-CHAMPAIGN

to nitrate nitrogen. Under normal conditions, the cations calcium, magnesium, potassium, and sodium will not be likely to leach to underdrain water. Chromium, lead, cadmium, and nickel did not appreciably collect in the soil. This method was the most economical of all tested and irrigation proved a viable disposal means for waste water sludge. It is simple, needs a minimum of operation attention, and does not create an odor nuisance if sludge is well digested before application. (Collins-FIRL)

SHORT COURSE PROCEEDINGS: APPLICATIONS OF STORMWATER MANAGEMENT MODELS,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 163, Price codes: A19 in paper copy, A01 in microfiche. Report EPA-670/2-75-065, June, 1975. 426 p, 137 fig, 56 tab.

Descriptors: *Model studies, *Water management(Applied), *Storm water, *Storm runoff, *Combined sewers, Hydrologic data, Water pollution, Pollution abatement, Simulation analysis, Mathematical models, *Computer programs.
Identifiers: *EPA Stormwater Management Model(SWMM).

Presentations are made of various storm water models to solve the problem of storm and combined sewer overflows and to make state pollution control agencies aware of these resources for pollution abatement. Discussed in the proceedings are such problems as the environmental effects of urban storm water runoff, the quantity and quality aspects of this runoff, the effects of runoff on the quality of receiving waters, and decision-making regarding quantity and quality control of water. The papers presented included data requirements and case studies of the different models, along with comparative analyses. Amongst the various models, the EPA Stormwater Management Model (SWMM) was highlighted. (See W77-07067 thru W77-07073) (Kutcher-FIRL)
W77-07066

INTRODUCTION TO URBAN STORM WATER RUNOFF MODELS,
Water Resources Engineers, Springfield, Va.
R. F. Shubinski.
In: Short Course Proceedings: Applications of Storm Water Management Models, August 19-23, 1974, Amherst, Massachusetts, University of Massachusetts, Amherst, p 177-199. 15 fig, 4 tab, 6 ref.

Descriptors: *Model studies, *Storm runoff, Water quality, Sewerage, Watersheds, Hydrologic aspects, *Urban runoff, Infiltration, Sewage effluents, Drainage, Flow.

Storm water runoff models were applied to a simplified urban drainage system. This system was composed of subsystems dealing with surface runoff, transport and quality of flow, and receiving waters. The surface runoff subsystem was a drainage area tributary to a sewer inlet--a system of surface elements, gutters, and drainage ditches. The transport system is the physical works which carry storm waters and their pollutant load from inlets through underground conduits to a point of disposal. Receiving systems could be streams, lakes, estuaries, or coasts. The hydrologic effects of urbanization and the characteristics of the urban watershed were considered. Factors controlling urban runoff include rainfall, infiltration, depression storage, surface detention and gutter detention, and storage in house drains, catch basins and major sewage elements. Land use influences imperviousness and surface cover which regulate surface depression, detention, and infiltration. A storm drainage model should analyze storm discharge from urban runoff by dividing the total basin into smaller homogeneous units to calculate individual runoff contributions. Collection of individual sub-basin outflows and their routing through main storm sewers allow determination of total watershed outflow at the basin outlet. (See also W77-07066) (Collins-FIRL)
W77-07071

SIMPLIFIED METHODS OF COMPUTING THE QUANTITY OF URBAN RUNOFF,
Water Resources Engineers, Springfield, Va.
R. P. Shubinski.
In: Short Course Proceedings: Applications of Storm Water Management Models, August 19-23, 1974, Amherst, Massachusetts, University of Massachusetts, Amherst, p 200-213. 7 fig, 4 tab, 2 ref.

Descriptors: *Analytical techniques, *Storm runoff, *Urban runoff, *Unit hydrographs, Peak discharge, Precipitation, Rainfall-runoff relationships, Watersheds(Basins), Design data, Drainage engineering, *Methodology.

Methods are considered for the computation of urban runoff quantities. Flow-frequency analysis involves using equations to obtain natural watershed conditions; plotting the computed discharges on probability paper and fitting a smooth curve; adjusting natural discharge for urbanization effects; and determining the required discharge. The rational method computes overland and channel travel time to obtain concentration time for watershed and design rainfall duration; it also computes the basin-wide coefficient of runoff precipitation intensity; and it determines peak discharge. The unit hydrograph method requires determining the rainfall excess available to the direct runoff process; separating baseflow from the corresponding hydrograph; determining volume of direct runoff; and dividing ordinates of the hydrograph (without baseflow) by volume of direct runoff. (See also W77-07066) (Collins-FIRL)
W77-07072

THE WRE STORM MODEL,
Water Resources Engineers, Springfield, Va.
R. P. Shubinski.
In: Short Course Proceedings: Applications of Storm Water Management Models, August 19-23, 1974, Amherst, Massachusetts, University of Massachusetts, Amherst, p 214-242. 8 fig, 5 tab, 9 ref.

Descriptors: *Model studies, *Water pollution sources, *Storm runoff, *Urban runoff, Precipitation(Atmospheric), Land use, Erosion, Urban hydrology, Analysis, Water quality, Watershed management.

The WRE STORM model was developed to help determine future magnitudes of urban runoff pollution loads from a given watershed, to help determine the pollution load for average and extreme events, and to determine the occurrence of a given extreme event. The STORM (storage, treatment, overflow, and runoff model) considers interctions of precipitation, air temperature for snowpack accumulation and snowmelt, runoff, pollutant accumulation on land surface, land surface erosion, treatment rates, storage, and overflows from the storage/treatment system. Land uses considered in this model include: single family residential, multiple family residential, commercial, industrial, parks, and non-urban or undeveloped areas. It is used with many years of continuous hourly precipitation records and may be used for selected single events as well as for continuous simulation. (See also W77-07066) (Collins-FIRL)

WATER QUALITY SIMULATION OF TAHOE-TRUCKEE SYSTEM, NEVADA-CALIFORNIA-VOLUME I,
Nevada Univ., Reno. Desert Research Inst.
J. A. Westphal, J. V. A. Sharp, and R. L. Bateman.
Available from the National Technical Information Service as PB-247 798, Price codes: A04 in paper copy, A01 in microfiche. Report EPA-600/2-76-005a, 1976. 67 p, 19 fig, 15 tab, 54 ref.

Descriptors: *Model studies, *Inorganic compounds, Water quality, *Water quality control, *Rivers, *Streams, Flows, Industrial wastes, Municipal wastes, Agricultural runoff, Surface waters, California, Nevada, Lakes.
Identifiers: *Tahoe-Truckee water system(Nev and Calif).

A model was developed to aid inorganic water quality control in the Tahoe-Truckee water system of Nevada and California. In this system impoundments, diversions for and returns from industrial, agricultural, and municipal uses, and groundwater returns influence inorganic quality and surface water flows. Mass-flux-balance is the basis of the model. Assumptions used relative to the model include: a conservative nature for inorganic constitutents, instantaneous, complete mixing, and the accurate recapitulation of flows at an unused gaging station. The model is based on data collected over three years at 40 sites. Calcium, sodium, potassium, chloride, sulfate bicarbonate, silica, magnesium, and total dissolved solids (less silica) were modeled. The model simulates concentrations at selected points and quality of dispersed flows. (Collins-FIRL)

A NONLINEAR MULTILEVEL TRANSPORTATION MODEL FOR WATER RESOURCE-WATER QUALITY MANAGEMENT,
Utah State Univ., Logan.
S. Pratishthananda.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 76-25,626. PhD Thesis, 1976, 181 p.

Descriptors: *Model studies, *Water resources, Comprehensive planning, Water reuse, Water quality, Effluents, Water users, Costs, Groundwater, Water resources.

A nonlinear multilevel transportation model was developed for the study of large scale water resources systems. This included allocation to multiple users and effluent treatment to meet required water quality standards. The basic framework is a modified transportation matrix. Included are cost functions for treatment and water transport. Salt Lake County, Utah, was used as a case study area. It was divided into four subregions with the water supplies as the interconnecting variables. Surface water, groundwater and import water were allocated to municipal, industrial and agricultural users for projected 1985 median needs. Effluent from treatment facilities were required to meet goals of Public Law 92-500. Management alternatives considered were allocations with no reuse of treated effluent and allocations with effluent reuse allowed for industrial and agricultural users. The reuse of effluent proved to be least costly. The model was considered as efficient as or better than nonlinear formulations. (Collins-FIRL)

5C. Effects Of Pollution

THE ACCUMULATION OF ORGANIC MERCURY FROM SEA WATER BY THE PLAICE, PLEURONECTES PLATESSA L.,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Radiobiological Lab.
R. J. Pentreath.
Journal of Experimental Marine Biology and Ecology, Vol. 24, p. 121-132, 1976. 7 fig, 5 tab, 12 ref.

Descriptors: *Metals, *Mercury, *Tracers, *Fish physiology, Metabolism, Path of pollutants, Mode of action, Water quality, Analytical techniques, Bioassay, *Absorption, Growth stages, Isotopes, Organic compounds, Fish eggs, Juvenile fish.
Identifiers: *Plaice, Pleuronectes platessa, Bioaccumulation, Tissue analysis.

The accumulation of organic mercury from sea water by plaice (Pleuronectes platessa) eggs, larvae and adult fish was studied using labeled CH3-HgCl as a tracer. The isotope was rapidly accumulated, the largest fraction taken up by muscle tissue. High concentration factors were attained by many internal organs, particularly blood, spleen, and kidney. Longer biological half-times than previous estimates with labeled HgCl2 were obtained. The possible consequences of inorganic mercury accumulated from sea water being excreted at the rate of methylmercury were calculated. (Katz)
W77-06607

ROTARY-FLOW TECHNIQUE FOR TESTING FITNESS OF FISH,
Uppsala Univ. (Sweden). Inst. of Zoophysiology.
P. E. Lindahl, S. Olofsson, and E. Schwanbom.
Biological Monitoring of Water and Effluent Quality, ASTM STP 607, p. 75-84, 1977. 3 fig, 9 ref.

Descriptors: *Design, *Methodology, *Laboratory tests, Water pollution, Water quality, Toxins, Research and Development, *Water temperature, Thermal properties, Fish physiology, Tolerance, Laboratory equipment.
Identifiers: *Fish fitness, *Cod, Salmo salar, *Ethanol.

An improved version of rotary-flow apparatus which allowed tests of fitness with fish of different size at constant temperature was described. Optimal experimental conditions were investigated with cod. The method was applied to the study of the influence of temperature on the effect of ethanol in cod and to comparison of the fitness of cod from an inconsiderably contaminated and a polluted area. (Katz)
W77-06608

A BIOLOGICAL MONITORING SYSTEM EMPLOYING RHEOTAXIS OF FISH,
Baden-Wuerttemberg Landesanstalt fuer Umweltschutz (West Germany).
W. K. Besch, A. Kemball, K. Meyer-Waarden, and B. Scharf.
Biological Monitoring of Water and Effluent Quality, ASTM STP 607, p. 56-74, 1977. 10 fig, 17 ref.

Descriptors: *Design, *Monitoring, *Laboratory tests, *Methodology, Toxicity, Toxins, Lethal limit, Fish physiology, *Fish behavior, Water quality, Water pollution, *Carp.
Identifiers: *Rheotaxis, Surfacing, Biological monitoring system, Acute poisoning, Toxicology, Specific toxic effects.

An automatic toxicity monitoring and alarm device using rheotaxis was described. The device was also used for static laboratory tests. When loss of rheotaxis along with surfacing were used for criteria for acute poisoning instead of death, the time required for toxicity tests was shortened. Visual observation of other parameters of behavior, such as schooling, yielded other information pertinent to the specific effects of certain toxins or particular concentrations of toxins. Loss of rheotaxis and surfacing was recorded automatically. Testing of the automatic monitoring device in the laboratory led to the development of a multichannel, automatically recording test apparatus. (Katz)
W77-06609

AN ELECTRONIC SYSTEM TO MONITOR THE EFFECTS OF CHANGES IN WATER QUALITY ON FISH OPERCULAR RHYTHMS,
National Inst. for Water Research, Pretoria (South Africa).
W. S. G. Morgan.
Biological Monitoring of Water and Effluent Quality, ASTM STP 607, p. 38-55, 1977. 8 fig, 1 tab, 13 ref.

Descriptors: *Monitoring, *Toxicity, *Methodology, *Water quality, *Design, Water pollution, Analytical techniques, Fish behavior, Electrical equipment, Fish physiology, Toxicity, Data collection.
Identifiers: Critical toxic condition, Biological automatic monitoring system, Electronic monitoring system, *Opercular rhythms(Fish), Water quality changes.

A rapid automated biological monitoring system intended to complement physical-chemical monitoring techniques was developed utilizing the fact that fish opercular rhythms increase under toxic conditions. Any increase above the expected rate under normal conditions was electronically monitored. A built-in visual alarm system served as an advance warning of the development of a toxic condition. The system was also able to control toxic industrial discharges, thus aiding the preservation of receiving water quality. (Katz)
W77-06610

LAS INHIBITION OF DIFFUSION AND UPTAKE OF TRITIATED URIDINE DURING TELEOST EMBRYOGENESIS,
Loyola Univ. of Chicago, Ill.
H. W. Manner, and C. Muehleman.
Environmental Biology of Fish, Vol. 1, No. 1, p 81-84, 1976. 2 tab, 1 fig, 13 ref.

Descriptors: *Mode of action, *Bioassay, *Embryonic growth stage, *Water pollution effects, *Surfactants, *Linear alkylate sulfonates, *Membrane processes, *Analytical techniques, *Tritium, *Absorption, Laboratory tests, Detergents, Sulfonates, Teleosts, Minnows, Permeability, Radioactivity, Radioisotopes, Inhibitors, Fish reproduction.
Identifiers: *Embryogenesis, *Pimephales promelas, *RNA synthesis, *Uridine.

Fathead minnow embryos (Pimephales promelas) of 5 different developmental ages (5, 33, 48, 72 and 96 hours after fertilization) were used as controls and exposed for 2 hours to a solution of 0.25 microCi per ml of tritiated uridine. Another set of embryos of the same ages were subjected to the same regimen except that during the one hour immediately preceding the uridine incubation, the control embryos were placed in water while experimental embryos were placed in water containing 15 ppm 11.2 LAS. In both cases, radiation counts per minute per embryo and per milligram of embryo increased over the 4 day developmental period. The embryos with LAS regimens displayed lower radiation counts at all ages as compared to controls, indicating an inhibition of diffusion and uptake of tritiated uridine and/or RNA synthesis. The possible mechanism of LAS is discussed. (Katz)
W77-06611

EFFECT OF MALACHITE GREEN AND FORMALIN ON THE SURVIVAL OF LARGEMOUTH BASS EGGS AND FRY,
Cheraw National Fish Hatchery, S. C.
L. D. Wright.
The Progressive Fish-Culturist, Vol. 38, No. 3, p 155-157, 1976. 2 tab, 14 ref.

Descriptors: *Bass, *Fish eggs, *Fry, *Toxicity, *Fungicides, Juvenile fish, Fish hatcheries, Fish parasites, Pathogenic fungi, Incubation, Laboratory tests, Mortality, Fish diseases, Bioassay.
Identifiers: Micropterus salmoides, *Malachite green, *Formalin, Saprolegnia.

Largemouth bass eggs and fry were exposed to various concentrations of malachite green and formalin. Formalin could safely be used as a fungus control for the eggs at the standard concentration of 4,000 ppm for 10 minutes, and the fry could safely be prophylactically treated at 50 ppm for 60 minutes. Malachite green proved to be extremely toxic and should not be used as a fungicide or prophylactic.

THE EFFECTS OF METHOXYCHLOR ON RIFFLE INVERTEBRATE POPULATIONS AND COMMUNITIES,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
P. J. Eisele, and R. Hartung.
Transactions of American Fisheries Society, Vol. 105, No. 5, p 628-633, 1976. 2 tab, 3 fig, 17 ref.

Descriptors: Streams, *Toxicants, *Pesticides, *Invertebrates, *Biological communities, *Bottom sampling, *Benthic fauna, *On-site investigations, Water pollution effects, Environmental effects, Stoneflies, Diptera, Ecosystems, Artificial substrates.
Identifiers: *Methoxychlor, *Riffle invertebrates, Baetids.

A study was conducted to evaluate the chronic effects of a toxicant on interacting stream invertebrate populations. The study involved the continuous dosing of a small stream at o.2 micrograms per liter methoxychlor for over one year. Invertebrate populations were monitored by artificial substrate and bottom sample collections of riffle invertebrates. Most invertebrate populations experienced som reduction due to the stream dosing. Some taxa)baetids and plecopterans) were effected as reflected by population reductions in dosed areas. Many taxa (hydropsychids, simulids and aeschnids) were temporarily affected, experiencing initial population reductions in dosed areas but then recovering to control levels. Other taxa (chironomids and elmids) were not affected. The riffle invertebrate community colonizing artificial substrates experienced a temporary decrease in bottom sample collections. In general, most longterm effects were minor in comparison to naturally occurring phenomena such as flooding. (Katz)

TOXICITY OF FLUORIDE TO BROWN TROUT FRY (SALMO TRUTTA),
Newcastle-upon-Tyne Univ. (England). Dept. of Zoology.
D. A. Wright.
Environmental Pollution, vol. 12, p. 57-62, 1977; 3 fig, 10 ref.

Descriptors: *Absorption, *Brown trout, *Fry, *Hardness(Water), *Toxicity, *Bioassay, *Lethal limit, *Fluorides, Juvenile fish, Trout, Salmonids, Rainbow trout, Mortality, Laboratory tests, Fluoridation, Industrial wastes.

The toxicity of fluoride to brown trout fry (Salmo trutta) was tested using groups of 100 animals in tapwater containing 29 ppm calcium with sodium fluoride added. Results obtained were similar to published work on S. gairdneri which showed a distinct fall in mortality rates below 20 mg/litre fluoride. Fluoride uptake was the same in dead fish taken from the toxicity testing aquaria and live fish. Concentration factors (animal fluoride concentrations:external fluoride concentrations) were small, reaching a maximum of 2.3 in animals in 5 mg/litre fluoride after 160 h. (Katz)
W77-06628

THE UPTAKE OF LEAD, ZINC, CADMIUM, AND COPPER BY THE PULMONATE MOLLUSC, HELIX ASPERSA MULLER, AND ITS RELEVANCE TO THE MONITORING OF HEAVY METAL CONTAMINATION OF THE ENVIRONMENT,
Bristol Univ. (England). Dept. of Botany.
P. J. Coughtrey, and M. H. Martin.
Oecologia, vol. 27, p. 65-74, 1977. 1 fig, 5 tab, 53 ref.

Descriptors: *Lead, *Zinc, *Cadmium, *Copper, *Absorption, *Animal physiology, *Mollusks, *Heavy metals, *Water pollution sources, Monitoring, Size, Invertebrates, Path of pollutants, Growth stages.
Identifiers: Bioaccumulation, *Helix aspersa, Terrestrial mollusks, Body weight(Mollusks).

The occurrence of lead, zinc, cadmium, and copper in individuals of Helix aspersa from two sites of varying degrees of contamination was studied. Zinc, cadmium, and copper were shown to increase to a linear fashion with animal weight. The rate of uptake for zinc and cadmium in particular was significantly greater at the more contaminated site. Statistical analysis of the data, using correlation and regression techniques provided information on apparent intermetallic effects. Because metal uptake and body weight show a positive linear relationship only the use of animals of similar weight and/or size can be used for monitoring purposes. Even then, different patterns of uptake into different organs and interactions between metal uptakes are such as to seriously question the use of Helix, and other molluscs, for monitoring purposes unless specific organs from comparably sized and/or aged animals are used. (Katz)
W77-06629

THE TOXIC EFFECTS OF SELECTED HEAVY METALS ON UNADAPTED POPULATIONS OF VORTICELLA CONVALLARIA VAR SIMILIS,
Surrey Univ., Guilford (England). Dept. of Microbiology.
D. P. Sartory, and B. J. Lloyd.
Water Research, Vol. 10, p. 1123-1127, 1976. 1 fig., 2 tab., 10 ref.

Descriptors: *Toxins, *Toxicity, *Heavy metals, *Protozoa, *Metals, Lethal limit, Water pollution sources, Mortality, Path of pollutants, Environmental effects, Laboratory tests, Sewage effluents, *Lead, *Mercury, *Zinc, Mode of action.
Identifiers: Bioaccumulation, *Vorticella convallaria var similis, Free metal ions.

Unadapted populations of Vorticella convallaria var similis, a sessile peritrich protozoan found abundantly in healthy rivers, activated sludge, percolating filters and slow sand filters were subjected to a range of concentrations of three common pollutant metals. These populations were killed by concentrations of and above, 0.0005 mg/l. of the free metal ion of either lead or mercury. Colonies were also killed by concentrations of, and above, 0.075 mg/l. of the free metal ion of zinc, 12 hr 50% lethal doses were calculated, and for V. convallaria var similis were 0.00036 mg/l. for lead, 0.005 mg/l. for mercury and 0.29 mg/l. for zinc. (Katz)

CHLORINE REACTIONS WITH SEAWATER CONSTITUENTS AND THE INHIBITION OF PHOTOSYNTHESIS OF NATURAL MARINE PHYTOPLANKTON,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
R. W. Eppley, E. H. Renger, and P. M. Williams.
Estuarine and Coastal Marine Science, Vol. 4, p. 147-161, 1976. 6 fig, 6 tab, 25 ref.

Descriptors: *Chlorine, *Chlorination, *Cooling water, *Water pollution sources, *Plankton, *Phytoplankton, Inhibition, Photosynthesis, Sea water, Salinity, Condensers, Water quality, Environmental effects, Analytical techniques, Growth rates.
Identifiers: Hypochlorite, Skeletonema costatum.

The time course of chlorine disappearance was followed in filtered (1), non-filtered (2), and u.v.-oxidized (3) seawater. In (1) and (2) there was an initial rapid decline in both free and residual chlorine followed by a slower decline of these species. No decline was observed in (3), suggesting that the removal of organic matter and/or the oxidation of metal ions by u.v.-oxidation removed those molecular species that reacted with chlorine. Reaction rate was more rapid in (2) than in (1), suggesting that particulate organic matter may also react with chlorine. Reaction kinetics of chlorine were complex but approximated second order in the slow phase. The inhibition of phytoplankton photosynthesis by chlorine was studied by adding hypochlorite to samples. Chlorine concentrations required for 50% inhibition varied with exposure time. For 24-h incubations such inhibitions took place with residual chlorine concentrations of 10 parts/10 to the 9th power. The inhibition appeared to be irreversible. The deleterious impact on marine phytoplankton by the use of seawater for cooling power plants lay in the use of chlorine to prevent slime build-up on the condensor system parts. (Katz)
W77-06637

THE FAUNA OF THE POLLUTED RIVER TEES ESTUARY,
Leeds Univ. (England). Wellcome Marine Lab.
J. S. Gray.
Estuarine and Coastal Marine Science, Vol. 4, p. 653-676, 1976. 8 fig, 8 tab, 62 ref.

Descriptors: *Estuaries, Water pollution, *Water pollution sources, *Productivity, Community development, Biomass, Worms, Algae, Population, Growth rates, Distribution patterns, *Environmental effects, Succession, Bacteria, Ecology, Wildlife, Invertebrates, Annelids, Food chains, *Nematodes, Ecosystems, Biological communities, Ecological distribution, *Gastropods.
Identifiers: Polycheates, *River Tees estuary(England).

The fauna at the mouth of the grossly polluted river Tees estuary, England, was surveyed in summer 1971 and spring 1973. Gastrotrichs and nematodes dominated numerically and were more abundant within the estuary than at open coast beaches, (2 x 10 to the 6th power compared with 8 x .000001 animals sq m). Few environmental factors correlated with faunal abundance. Sewage bacteria showed a positive correlation with gastrotrichs at open coast beaches and a negative correlation at sheltered beaches, whereas nematodes showed a positive correlation with sewage bacteria at a sheltered sand beach and a negative correlation at a muddy beach. Annelids did not show correlations with granulometric factors and comprised 98% of the biomass of the muddy area. Using data on annelid species, diversity patterns and a variety of multivariate analyses all showed that at the muddy Seal Sand, a central area could be distinguished from a peripheral area. The central area was physically stable and was covered by an algal mat. This area contained the polycheates Capitella capitata, Polydora ciliata, Streblospio shrubsolii and Manayunkia aestuarina and the oligochaetes Peloscolex benendeni and Tubifex pseudogaster. The macrofauna comprised fewer species when compared with a survey done in 1935; in particular there were fewer species of pelecypods. There were no detectable effects of pollution on the meiofauna; the numbers of organisms and total biomass were comparable with those of other temperate estuaries. (Katz)

TISSUE ACCUMULATION AND ENZYMATIC EFFECTS OF HEXAVALENT CHROMIUM IN RAINBOW TROUT (SALMO GAIRDNERI),
Battelle Pacific Northwest Labs., Richland, Wash.
D. R. Buhler, R. M. Stokes, and R. S. Caldwell.
Journal of the Fisheries Research Board of Canada, Vol. 34, p. 9-18, 1977. 6 tab, 1 fig, 27 ref.

Descriptors: *Chromium, *Freshwater fish, Salmonids, *Rainbow trout, *Laboratory tests, *Biochemistry, *Bioassay, Enzymes, *Water pollution effects, Path of pollutants, Toxicity, Mortality, Cooling water, *Fish physiology, Biochemistry, Columbia River.
Identifiers: *Hexavalent chromium, Whole body residues, Skeletal muscle tissue.

Two-year-old rainbow trout (Salmo gairdneri), reared for 2 yr in water containing about 0.00025 mg/l hexavalent chromium (Cr+6) (Naches trout) or between 0.002 and 0.01 mg/l Cr+6 (Hanford trout) accumulated appreciable chromium, yielding whole body residues of about 0.029 and 0.18 micrograms/g wet tissue, respectively. Highest concentrations were in the opercular bone, spleen, kidney, gastrointestinal tract, and gall bladder. Short-term exposure of Hanford trout to 2.5 mg/l Cr caused a rapid additional increase of tissue chromium, but at 22 days whole body levels were only 0.87 micrograms/g. Upon return of exposed fish to water continuing 0.002-0.01 mg/l chromium, the metal was rapidly depleted from most tissues except kidney, liver, gill, gall bladder, and bile. Chromium accumulated in tissues of trout exposed to 2.5 mg/l Cr was not distributed proportionally among the various subcellular fractions but concentrated in the cell cytosol, especially in the liver and gill. Mitochondrial cytochrome oxidase, NADH-cytochrome c reductase, and succinate cytochrome c reductase activities in liver, kidney, gill, and brain tissues of Naches trout, Hanford trout, and Hanford trout exposed to 2.5 mg/l Cr were not significantly different except for kidney NADH-cytochrome c reductase which was lower in Hanford and chromium treated fish. Microsomal nitroreductase, O-demethylase and NADPH-cytochrome c reductase and the soluble glucose-6-phosphate dehydrogenase activities in liver and kidney from Hanford trout were significantly lower than those of Naches trout. Exposure of Hanford trout to 2.5 mg/l Cr, however, did not reduce the activities of these enzymes below control levels. In vitro studies showed that trout enzymes were fairly insensitive to Cr inhibition. These results suggest that observed differences in enzyme activity between Naches and Hanford trout may be caused by factors other than chromium content of the water. (Katz)

EFFECTS OF PRESSURE, TEMPERATURE AND OXYGEN ON THE OXYGEN-CONSUMPTION RATE OF THE MIDWATER COPEPOD GAUSSIA PRINCEPS,
California Univ., Santa Barbara. Marine Science Inst.
J. J. Childress.
Marine Biology, Vol. 39, p. 19-24, 1977. 1 tab, 3 fig, 22 ref.

Descriptors: *Copepods, *Plankton, Marine organisms, *Oxygen requirements, California, Water properties, *Pressure, *Temperature, *Vertical migration, Diurnal, Laboratory tests, Methodology, Animal physiology.
Identifiers: Gaussia princeps, *Calanoid copepod, *Oxygen minimum layer, Anaerobic metabolism.

Gaussia princeps is a diurnal vertical migrator which spends its days below 400 m in the oxygen minimum layer and migrates to shallower depths (200 to 300 m) at night. This species' consumption was measured at 3.5, 7 and 10C and 1, 14, 28, 61, 121, and 181 atm of hydrostatic pressure (1 atm corresponds to approximately 10 m of depth). The Q10 of the oxygen consumption is higher at lower temperatures and higher pressures. Hydrostatic pressure has significant effects on the oxygen-consumption rate at pressures as low as 28 atm. At all temperature and pressure combinations, G. princeps displays a very low metabolic rate compared to shallow living copepods. The critical oxygen partial pressure for this species is about 10 to 13 mm Hg O2 at 10, 7 and 5.5C. Based on these data, a predicted relation between depth and oxygen consumption by this species off California, USA, is presented. This shows a higher oxygen-consumption rate at the nighttime depths and a much lower, partially anaerobic metabolism at the daytime depths. (Katz)

R. S. Anderson, and R. B. Green.
Canadian Wildlife Service, Occasional Paper No. 27, 1976. 41 p. 13 fig., 6 tab., 62 ref. (Published in Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, p. 571-579, 1975).

Descriptors: *Biological communities, *Baseline studies, *Zooplankton, *Phytoplankton, Canada, Water chemistry, Winds, Water circulation, Hydrologic cycle, Histograms, Varieties, Water pollution effects, Human population, Limnology.
Identifiers: *Waterton Lakes(Alberta), Upper Waterton Lake(Alberta), Lower Waterton Lake(Alberta), Knight's Lake(Alberta).

The major lakes of Waterton Lakes National Park in southwestern Alberta (Canada), Upper and Lower Waterton and Knight's Lakes, were investigated to determine the extent of their enrichment due to their central location in the park, the townsite, and the major campground facilities on their shoes. The water renewal rate of Upper Waterton Lake is .8 times per year; lower Waterton's rate is 7.1 and Knight's Lake is 161.. A total of 164 species and subspecies of algae were identified in the lakes during 1972-1975. Zooplankton included 19 crustacean and 12 rotiferan species, and their composition appears to have remained unchanged since 1973, although aboundance has increased, as have the phytoplankton abundance and species numbers. The physical conditions and chemical constituents have remained fairly constant although some nutrient enrichment was evident. New sewage treatment facilities at the townsite, which contains a resident popultion of 120 but peaks to 510,086 annually, are expected to eliminate the cultural nutrient source, although, when compared to the lake volume, it is relatively small. However, it may have been responsible for recent increases in plankton abundance. (Auen-Wisconsin).

Rensselaer Polytechnic Institute FWI Report 77-2, January 1977. 35 p. 7 fig., 4 tab., 38 ref. NSF AG-199, BMS76-00761.

Descriptors: *Mathematical models, *Computer models, *Microbial degradation, Microorganisms, Organic matter, Lakes, Detritus, Cycling nutrients, Simulations.
Identifiers: Computer model CLEANER, *Lake George(NY).

A microbial decomposition mathematical model which represents the dual role of microflora as a food source and as an agent of biogeochemical cycling in the pelgic portion of a lake has been developed as an adjunct to the ecosystem model CLEANER. The model represents microbial processes with greater realism than most existing ecosystem models and shows promise of applicability under varying conditions. The model conceptualizes the microbial growth and decomposition compartments by WRDOM-refractory dissolved organic matter in water; WLDOM-labile dissolved organic material in water; WDEC-decomposers in water; DDEC-decomposers of detritus; DDOM-dissolved organic material or detritus: POM-particulte organic material; and

LIBRARY U. OF I. URBANA-CHAMP.

DIM-dissolved inorganic material. It is amenable to detailed inspection for holistic relationships that are not evident when each process is considered separately under experimental conditions, and is most useful in simulating ecosystem responses to environmental perturbations, and in determining the sensitivity of the ecosystem to variations in the components and processes that constitute the microbial decomposition subsystem. For example, it can be used to consider the availability of various classes of dissolved organic matter and the differential rates of uptake by decomposing micro-organisms as modified by natural environmental variations throughout the year. Sensitivity analyses can be readily performed using the interactive capability of the model on a time-sharing computer system. (Auen-Wisconsin)

Ekologia Polska, Vol. 24, No. 2, p. 237-252, 1976. 6 fig., 1 tab., 35 ref.

Descriptors: *Phytoplankton, *Biomass, *Trophic level, Europe, Eutrophication, Mesotrophy, Seasonal, Temporal distribution, Productivity, Foreign countries, Nannoplankton, Lakes.
Identifiers: *Lake Piaseczno(Poland), *Lake Bikcze(Poland).

Seasonal dynamics of phytoplankton biomass were investigated during 1971-1972 in alpha-mesotrophic Lake Piaseczno and in eutrophic Lake Bikcze in Poland. Biomass values were lowest in winter and highest in summer with qualitative seasonal variability primarily expressed by changes in the communities' taxonomic structure. Cyanophyta and Baccilariophyceae dominated in spring and summer; in the other seasons Cryptophyceae, Baccilriophyceae, of the phytoplankton were also similar in both lakes. The nannoplankton biomass and its contribution to total biomass were highest from late autumn till early spring. The different trophic levels of the lakes were reflected in the biomass variations, as biomass concentration in a water volume unit was usually higher in Lake Bikcze. The frequently observed biomass concentration in the metalimnion of Lake Piaseczno is characteristic for lakes in the oligotrophic range. The species diversity and nannoplankton contribution to biomass were higher in the mesotrophic lake. The range of biomass changes within a year was higher in both lakes in 1971 than in 1972. In Lake Piaseczno it was 1:59 in 1971 and 1:7 in 1972 and in Lake Bikcze 1:1057 and 1:74, respectively. (Auen-Wisconsin)

THE MINING FAUNA IN FOUR MACROPHYTE SPECIES IN MIKOLAJSKIE LAKE,
Polish Academy of Sciences, Warsaw. Lab. of Ecological Bioenergetics.
E. Urban.
Ekologia Polska, Vol. 23, No. 3, p. 417-435, 1975. 5 fig., 10 tab., 15 ref.

Descriptors: *Aquatic plants, *Parasitism, *Insects, *Oligochaetes, Diptera, Worms, Varieties, Mode of action, Europe, Foreign countries, Lakes.
Identifiers: *Borer fauna, Lepidoptera, Hydrocarina, Potamogeton, Elodea canandensis, Myriphyllum spicatum, Glyptotendipes, Mikolajskie Lake(Poland).

Research in Poland's Mikolajskie Lake details composition, distribution, seasonal variation, and effects of mining fauna infesting Potamogeton lucens, P. perfoliatus, Elodea canadensis and Myriophyllum spicatum. Of 22 borers identified, the dominant group in P. perfoliatus and P. lucens was Chironomidae; the dominant borers of E. canadensis and M. spicatum were the larvae of Lepidoptera and Glyptotendipes gripekoveni. Clear differences were observed in the mining rate between the individual parts of plants. In P. lucens and P. perfoliatus the highest infestation rate was recorded in the stems, then in the leaf veins, with the leaf blades showing the lowest infestation rate. In E. canadensis and M. spicatum mining was restricted to the stems with lower infestation rates in the pondweed stems. Infestation rates in plants of the same species growing in different depths differed. The fauna lived in mines differing in shape and number of openings. The loss of stem tissue due to the mining activity for P. perfoliatus was 13.2%, in P. lucens 6.5%, in E. canadensis 1.2% and in M. spicatum 0.3% of wet weight. (Auen-Wisconsin).

THE INFLUENCE OF ACROLEIN AND HYDROCRYLE ON THE DEVELOPMENT DYNAMICS OF AQUATIC BACTERIA,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
A. Starzecka.
Acta Hydrobiologica, Vol. 17, No. 4, p. 391-403, 1975. 4 fig., 3 tab., 6 ref.

Descriptors: *Toxicity, *Aquatic bacteria, Bacteria, Lethal limit, Cooling water, Cooling towers, Streams, Thermal powerplants, Pseudomonas, Pipe flow, Fouling.
Identifiers: *Acrolein, *Hydrocryle, Trzebunka Stream(Poland), Achromobacter-Alcaligenes.

Acrolein and hydrocryle were used to control the excessive, objectionable development of bacteria in the condenser pipes at a power station. This study analyzes the influence of these toxic substances on the development of bacteria occurring in the clean water of the Trzebunka Stream and the polluted water flowing through the thermal power station condensers. It was concluded that: (1) Pure strains of bacteria were less resistant to the action of acrolein than mixed populations; (2) nutritive enrichment of the water decreased the influence of acrolein and hydrocryle; (3) bacteria from clean water was more sensitive to the toxic substances than populations from polluted waters; (4) hydrocryle was more toxic to bacteria than acrolein; (5) acrolein underwent a biological as well as chemical degradation in an aquatic environment; (6) doses of 1000 mg/l of acrolein and 580 mg/l of hydrocryle caused a lethal effect on mixed populations of bacteria in the condenser water; (7) non-lethal concentrations introduced a temporary inhibition of the bacterial growth; (8) non-lethal concentrations should be applied every 24 hours in order to decrease the number of bacteria in the cooling system water; and (9) the use of too low concentrations was angerous since it could induce the formation of resistant populations. (Luedtke-Wisconsin)

THE SHARE OF ALGAE WITH DIFFERENT DIMENSIONS IN THE PLANKTON OF TWO LAKES OF DIFFERENT TROPHIC CHARACTER IN THE ANNUAL CYCLE,
Instytut Przyrodniczych Podstaw, Lubin (Poland). Produkeji Roslinnej AR.
W. Wojciechowska.
Acta Hydrobiologica, Vol. 18, No. 2, p. 127-138, 1976. 3 fig., 1 tab., 13 ref.

Descriptors: *Lakes, *Phytoplankton, *Biomass, Trophic level, Algae, Nannoplankton, Seasonal.
Identifiers: *Lake Piaseczno(Poland), *Lake Bikcze(Poland).

The seasonal variations of the numbers and biomass of the phytoplankton in two lakes, a eutrophic, pond type lake and a deep, alpha-mesotrophic lake, are presented along with the changes of the share of different fractions of phytoplankton in total numbers and biomass. Phytoplanktonic organisms were divided into 3 fractions according to linear size: less than 20 micrometers, 20-60 micrometers and greater than 60 micrometers. It was found that the microplankton decided the total biomass even if the nannoplankton appeared in superior numbers. In Lake Piaseczno the smallest algal fraction had a significant share in the total biomass only during spring. The biomass of algae less than 20 micrometers decreased during the summer and autumn which caused a predomination of the greater than 20 micrometer fractions. It was found that the range of changes in the total phytoplankton biomass of the lakes confirmed the estimation of their tropic type. In the rich pond-like Lake Bikcze the extreme annual values of biomass was 1:1.057 whereas similar values for the alpha-mesotrophic Lake Pieseczno were only 1:60. The significant quantity of nannoplankton in Lake Piaseczno showed that the lake was poor and almost oligotrophic. A much smaller share of nannoplankton was found in Lake Bikcze during the warm seasons. (Luedtke-Wisconsin)

PRESENTING TRENDS IN LAKE EUTROPHICATION,
CBA Engineering Ltd., Vancouver (British Columbia).
S. Hershman, and S. O. Russell.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers. Vol. 102, No. EE6, p. 1281-1285, 1976. 2 fig., 2 tab., 2 ref.

Descriptors: *Eutrophication, *Methodology, *Projections, Forecasting, Estimating, *Canada, Decision making, Water quality, Phosphorus, Nutrient removal, Lakes, Risks.
Identifiers: *Skaha Lake(British Columbia), Phosphorus loading.

A procedure developed to define probable trends in water quality in Skaha Lake, British Columbia, is presented. The method, based on the concepts of Bayesian decision theory, takes into account uncertainty, provides a way of combining information obtained from individual experts, and presents the results in a way that can be generally understood. It allows the vast amount of available quantitative and qualitative information to be condensed into a form that could be understood and used as a basis for action by decision makers. Skaha Lake has a surface area of 5000 acres, a mean depth of 85 ft, an average flushing time of 1.2 yr, and is becoming eutrophic. Because of the direct relationship between phosphorus loading and water quality in the lake, the procedure for predicting future water quality under alternative management schemes was relatively straightforward. It involved categorizing the water quality into seven discrete trophic states; establishing a relationship in the form of a probability bond between nutrient loading and water quality; and combining it with nutrient forecasts under various management alternatives to obtain estimates of probable future water quality states. Results are presented in a probability matrix assuming a skew normal distribution for the case where sewage treatment continues at the 1971 level and for an alternative where 80% of the phosphorus is removed. ECOLOGICAL RELATIONS BETWEEN INVERTEBRATES AND SUBMERGED MACROPHYTES IN THE LAKE LITTORAL,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
G. J. Soszka.
Ekologia Polska, Vol. 23, No. 3, p. 393-415, 1975. 7 fig., 4 tab, 50 ref.

Descriptors: *Invertebrates, *Littoral, *Lakes, Oligochaetes, Submerged plants, Pondweeds, Aquatic plants, Plant growth, Food habits, Reproduction, Aquatic animals.
Identifiers: *Macrophytes, *Mikolajskie Lake(Poland), Potamogeton perfoliatus, Potamogeton lucens, Myriophyllum spicatum, Elodea canadensis, Relationships.

The ecological relations between the invertebrates and submerged macrophytes, Potamogeton perfoliatus, P. Lucens, Myriophyllum spicatum, and Elodea canadensis, in the littoral zone of Mikolajskie Lake are studied, with emphasis on feeding of invertebrates, use of macrophytes by fauna during reproduction and development, and influence of invertebrates on submerged macrophytes. Results indicated that the invertebrates most strongly related to the plants were the Lepidoptera larvae, Limnephilus sp., Phryganea grandis, and to a lesser extent the Chironomidae larvae and Radix ovata. The Oligochaeta which are very abundant on macrophytes were weakly associated with plants. Macrophytes were used by invertebrates more as a life substrate than as food. The relations of the majority of invertebrates with macrophytes were not permanent and the macrophytes could be substituted by another substrate. The life activity of invertebrates caused varying damage to the macrophytes, with pondweeds destroyed to a much greater extent than E. canadensis or Mspicatum. P. perfoliatus and P. lucens were used more by fauna than E. canadensis and M. spicatrum. These interrelations revealed a dynamic character and changed over the year. (Luedtke-Wisconsin)

A STUDY ON THE ROLE OF HERBIVOROUS ZOOPLANKTON COMMUNITY AS PRIMARY CONSUMERS OF PHYTOPLANKTON IN DUTCH LAKES,
R. D. Gulati.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1202-1210, 1975. 2 fig., 3 tab., 27 ref.

Descriptors: *Lakes, *Zooplankton, *Phytoplankton, *Food chains, Trophic level, Food pyramids, Digestion, Primary production, Respiration, Animal physiology, Biomass, Standing crops, Foreign research, Foreign countries, Water chemistry.
Identifiers: *Lake Vechten(Netherlands), *Lake Tjeukemeer(Netherlands).

As a counterpoint to most field studies of zooplankton productivity that are oriented toward population dynamics, research is offered on the trophic relationship of zooplankton with algae, bacteria and detritus in aquatic environments. The study is the first attempt to compare the ingestion, assimilation, respiration and production rates of the herbivorous zooplankton in Lake Vechten and Lake Tjeukemeer during 1972-73. Lake Vechten, a 4.7 hectare, isolated deep dug-out pit that exhibits hypolimnetic oxygen depletion and nutrient accumulation, has nutrient-poor epilimnetic waters, high transparency, and a great diversity of phytoplankton species despite relatively moderate production and biomass. Lake Tjeukemeer is a 21 sq km shallow lake connected to the Friesian water system, with water rich in dissolved humic compounds and low transparency. Tjeukemeer is nutrient rich and the sharp seasonal oscillations in the water chemistry are governed by the hydrological regime in the area. Sampling on both lakes was done at fortnightly intervals. Ingestion and assimilation rate experiments were made with lake phytoplankton as carbon-14 tracer food. Standing crop biomass and total zooplankton were estimated, and the biomass of filter feeders was obtained indirectly from the zooplankton data. Zooplankton oxygen consumption rates were measured by potentiometer. All other parameters--physicochemical conditions of the water, chlorophyll, primary production, etc.--were measured in a laboratory as part of ongoing studies of two lakes. (Harris-Wisconsin)

SOME EFFECTS ON INTEGRAL PHOTOSYNTHESIS OF ARTIFICIAL CIRCULATION OF PHYTOPLANKTON THROUGH LIGHT GRADIENTS,
D. H. Jewson, and R. B. Wood.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1037-1044, 1975. 5 fig., 16 ref.

Descriptors: *Photosynthesis, *Laboratory tests, *Light penetration, Phytoplankton, Limnology, Foreign countries, Measurement.
Identifiers: Bottle tests(Photosynthesis), Spirulina platensis, Lough Neagh(Northern Ireland), Lake Aranguadi(Ethiopia).

Photosynthesis studies with light and dark bottles suspended at a single depth throughout exposure time often fail to duplicate conditions found in shallow lakes in windy area where complete water column mixing prevails for long periods. To assess the effect on integral photosynthesis of cases where the phytoplankton may be circulated through a strong light gradient by this mixing, preliminary experiments were carried out on Lough Neagh, Northern Ireland and on laboratory cultures of Spirulina platensis (Gom.) Geitl. isolated from Lake Aranguadi in Ethiopia. The former lake has a photosynthetic zone of 1-3 m and the latter's photosynthetic zone may fall as low as 0.15 m. Light measurements in the laboratory were made using an ISCO spectroradiometer and remote probe. Changes in oxygen level were determined by the Winkler method with the endpoint detected amperometrically. In the circulation experiments oxygen determinations, gross photosynthesis was obtained by adding to the oxygen increase in the circulator an amount of oxygen equivalent to that consumed in the dark bottles. Experiments in the laboratory, using S. platensis isolated from Lake Aranguadi, measured the effect of circulation, at speeds of 1 cm/sec and 4 cm/sec, on the photosynthetic rate. The obtained rates obtained were consistent with rates derived from stationary bottles. (Harris-Wisconsin)

THE USE OF REMOTE SENSING TO DETECT HOW WIND INFLUENCES PLANKTONIC BLUE-GREEN ALGAL DISTRIBUTION,
A. J. Horne, and R. C. Wrigley.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 784-971, 1975. 4 fig., 13 ref.

Descriptors: *Cyanophyta, *Remote sensing, *Photometry, *Winds, Algae, Spatial distribution, Anabaena, Aerial photography, California, Pollutant identification.
Identifiers: *Clear Lake(Calif), *Multispectral scanning, Aphanizomenon.

Biological and physical aspects of cyanophyta movements in relaton to prevailing winds over a summer in Clear Lake, California were measured in aerial pictures taken with a multispectral camera with four 100 m F. L. lenses and Kodak Type 2424 film. Images were recorded simultaneously in the near-infrared (730-900)nm), red (590-690 nm), green (470-590 nm) and blue (400-470 nm) bands. Winds were measured using a recording anemometer standing some 50 m above the lake surface on a peninsula adjacent to all three arms of the lake. Water samples for phytoplankton and turbidity measurement were collected by simple dip in the upper few centimeters of lake water. Chlorophyll-a was measured using 90% methanol extraction. Results of the study showed that the role of the wind dominates in the production of blue-green algal concentration patterns and together with high light intensities, provides a possible explanation for the seasonally bimodal blooms of Aphanizomenon and Anabaena. Very light nocturnal winds permit surface films which are killed by high sunlight in summer. In the lower light of autumn these films can be windblownk to areas of higher photic zone nutrient concentrations. (Harris-Wisconsin)

THE HISTORIC AND PRESENT RELATIONSHIPS BETWEEN PHYTOPLANKTON, LIMITING NUTRIENTS, AND SEDIMENT-WATER GEOCHEMICAL PROCESSES IN SELECTED MAINE LAKES,
Maine Univ. at Orono. Land and Water Resources Inst.
R. B. Davis, and S. A. Norton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 024, Price codes: A08 in paper copy, A01 in microfiche. Completion Report, December 1976. 164 p. OWRT A-026-ME(3).

Descriptors: Diatoms, Diffusion, Interstices, Lakes, *Maine, Paleolimnology, Pollen, Sedimentation rates, *Sediment-water interfaces, Watersheds(Basins), Organic matter, *Trophic level, Systematics, Nutrients, *Nutrient requirements, History.
Identifiers: Chronology, Cultural disturbance, Environmental tolerances, Historical records, Sediment chemistry, Sediment cores, Vertical variations.

A paleolimnological study was undertaken for a group of Maine lakes in an attempt to demonstrate the historical influence of man on lake trophic conditions. Pollen analyses, in combination with historical records for each lake watershed, were used to determine chronology and sedimentation rates within the sediment cores. Diatom analyses revealed that major shifts in the relative abundance of specific diatom toxa have occurred in several lakes over the past 200 years. However, detailed interpretation of these shifts is frustrated by the lack of knowledge of present-day environmental tolerances of the toxa. Vertical variations in sediment chemistry also correlate with the onset of European man's activity within the watershed, but behavior of individual elements seems to be unique for each lake. K2O was the most consistent indicator of cultural disturbance; CaO was the least. Also, organic content of precultural sediments was generally lower than that of cultural sediments. Interstitial water chemistry profiles indicated that sediment-water interfaces were enriched in Fe, Mn, P, and Si because of upward diffusion of the dissolved species. General levels of K, Na, Ca, Mg, and Si in the interstitial waters were not directly related to bulk chemistry of the solid sediment. (Hutchins-Maine)

AMMONIA CONCENTRATION IN RELATION TO AMMONIA TOXICITY DURING A RAINBOW TROUT REARING EXPERIMENT IN A CLOSED FRESHWATER-SEAWATER SYSTEM,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
B. L. Hampson.
Aquaculture, Vol 9, p 61-70, 1976. 1 fig, 2 tab, 13 ref.

Descriptors: *Salmonids, *Rainbow trout, *Nitrogen compounds, *Ammonia, *Fish hatcheries, Fish physiology, Laboratory tests, Water chemistry, Toxicity, Hydrogen ion concentration, Aquiculture, Monitoring.
Identifiers: Un-ionized ammonia, *Ammonia toxicity.

The daily monitoring of total ammonia, un-ionized ammonia, pH and temperature during a 10-month rainbow trout rearing experiment in fresh and sea water, in which fingerlings were brought up to market size in a closed circuit system, is described. The results show that high feeding, high stock intensity conditions which favour rapid growth and economic rearing, are also conditions which produce extremely low concentrations of un-ionized ammonia, and hence complete safety in respect of the ammonia toxicity hazard. Un-ionized ammonia concentration was consistently between 0.0001 and 0.1 ppm nitrogen, i.e. between 1/3000 and 1/3 of the toxic threshold. After the establishment of populations of ammonia bacteria in the sand filters, un-ionized ammonia concentrations were normally below 0.002 ppm nitrogen in fresh water and 0.0005 ppm in sea water, i.e. less than 1/150 and 1/500 of the toxic threshold. (Katz)
W77-06743

FISH DISEASES AND PARASITES IN RELATION TO THE ENVIRONMENT,
Fish Farming Experimental Station, Stuttgart, Ark.
G. L. Hoffman.
Fish Pathology, Vol 10, No 2, p 123-126, 1976. 1 tab, 23 ref.

Descriptors: *Fish diseases, *Environmental effects, *Pathogenic fungi, *Water temperature, *Oxygen requirements, *Fish physiology, Fish parasites, Nutrition requirements, Water chemistry, Eutrophication, Epizootiology, Pathogenic bacteria viruses, Protozoa.
Identifiers: Environmental conditions, Neoplasias, Helminths.

Although some diseases are not affected by subtle environmental changes, others are. Factors which may influence infection or the course of disease are: temperature, gaseous supersaturation, oxygen deficiency, mechanical and physiological trauma of the fish, malappropriate water chemistry, pollution, eutrophication, media for spore retention, and presence of intermediate hosts. Avitaminoses and neoplasias are often related to environmental changes. (Katz)

CHANGES IN THE BLOOD CHEMISTRY OF COHO SALMON EXPOSED TO MALACHITE GREEN,
Fish and Wildlife Service, La Crosse, Wis. Fish Control Lab.
T. D. Bills, and J. B. Hunn.
The Progressive Fish-Culturist, Vol. 38, No. 4, p. 214-216, 1976.

Descriptors: *Salmon, *Fish physiology, *Fungicides, Salmonids, Chemical analysis, Bioassay, Fish parasites, Fish hatcheries, Toxicity, Biochemistry.
Identifiers: Blood samples, *Malachite green, Starvation, *Hematology, *Histology, Leukopenia, *Coho salmon.

Two groups of Coho salmon, one group fed and one starved, were exposed to a sublethal concentration (0.1 mg/l) of malachite green for up to 28 days to determine the fungicide's effect on blood chemistry, hematology and histopathology. The study found no discernible differences except an increase in plasma potassium and fewer macrophages in the spleen and kidney of the treated fish. (Katz)
W77-06746

FIELD TESTS OF ISOBORNYL THIOCYANOACETATE (THANITE) FOR LIVE COLLECTION OF FISHES,
Fish and Wildlife Service, Warm Springs, Ga. Southeastern Fish Control Lab.
R. M. Burress, P. A. Gilderhus, and K. B. Cumming.
Investigations in Fish Control, United States Department of the Interior, Washington, D.C. No. 71, 1976. 13 p, 11 tab, 18 ref.

Descriptors: *Sampling, Fish, *Catfish, *Carp, *Insecticides, *Fish behavior, Fish harvest, *Mortality, *Bass, *Ponds, Freshwater fish, Methodology, Pest control, Chemicals, Fish management, Fish control agents, Agriculture.
Identifiers: *Isobornyl thiocyanoacetate, *Thanite, Live-collecting(Fish), Sedatives, *Lepomis ssp.

Eight ponds containing a total of 28 species of fish were treated with isobornyl thiocyanoacetate (Thanite) to test its efficacy for the live collection of fish. Twenty-six species were collected alive after 1 to 4 microliters per liter applications of Thanite. Most scalefishes except carp (Cyprinus carpio) were relatively easy to collect, and catfishes (Ictaluridae) were generally the most resistant to effects of the chemical. With the exception of northern pike (Esox lucius), most fish recovered quickly after being placed in fresh water. Most fish collected within 1.5 h after treatment survived, but survival rates decreased with time of exposure. The concentrations effective for collection of live fish did not routinely eliminate all fish; small numbers of at least eight species of fish survived treatments of 1.5 microliters per liter or more. The high percentages of fish (of most species) collected alive demonstrated that Thanite is effective for the intended purpose. (Katz)
W77-06747

TOXICITY OF ROTENONE TO FISH IN STANDARDIZED LABORATORY TESTS,
Fish and Wildlife Service, La Crosse, Wis. Fish Control Lab.
L. L. Marking, and T. D. Bills.
Investigations in Fish Control, United States Department of the Interior, Washington, D.C. No. 72, 1976. 11 p, 11 tab, 1 fig, 26 ref.

Descriptors: *Toxicants, *Toxicity, *Fish eggs, *Atlantic salmon, *Bioassay, *Mortality, *Rotenone, *Pesticides, *Laboratory tests, *Rainbow trout, *Resistance, Water temperature, Hydrogen ion concentration, Fish control agents, Salmonids, Pesticide residues, Persistence, Channel catfish.
Identifiers: *Noxfish, *Carassius auratus.

Noxfish, which contains 5% rotenone, was toxic to a variety of freshwater fish at concentrations ranging from 21.5 to 497 micrograms per liter in 96-h laboratory exposures. Goldfish (Carassius auratus) and black bullheads (Ictalurus melas) were the most resistant species and the Atlantic salmon (Salmo salar) was the most sensitive. Toxicity was influenced little by temperature of 7 to 22 C, by water hardness of 10 to 300 mg/l, or by pH's of 6.5 to 9.5. In exposures of rainbow trout (Salmo gairdneri), newly fertilized eggs were much more resistant than fingerlings. Noxfish detoxified in water solutions: the half-life of biological activity was 22 days at 12 C and 13 days at 17 C. Potadsium permanganate was an excellent detoxifier; chlorine was less efficient. Noxfish was consistently more toxic in static tests than in flow-through tests. (Katz)

Identifiers: Morphometry, *Poland(Konin area lakes).

Investigations were conducted on the bottom fauna of the littoral and mid-lake area during the period 1965-1969 in a complex of lakes with an artificially created horizontal thermic gradient. Heating of the water caused a drop in numbers and of the biomass, a change in the qualitative composition of the bottom fauna, and especially development of preying forms. Average length of Chironomidae was also lower. (See also W77-06750 and W77-06751) (Katz)
W77-06749

THE INFLUENCE OF EFFLUENT HEATED WATERS ON THE BOTTOM FAUNA OF LAKES IN THE VICINITY OF KONIN II. CHANGES IN TIME OF BOTTOM FAUNA, (IN POLISH),
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland). Zaklad Hydrobiologii.
L. Leszczynski.
In: Roczniki Nauk Rolniczych, Seria H, Rybactwo Vol 97(3), p. 29-47, 1976. 3 tab, 8 fig, 2 ref.

Descriptors: *Water pollution effects, *Thermal pollution, *Water temperature, *Benthic fauna, On-site data collections, *Biological communities, Seasonal, Productivity, Diptera, *Oligochaeta, Littoral, Lakes, Diptera.
Identifiers: Seasonal fluctuations, Morphometry, Poland(Konin area lakes).

During the investigations on bottom fauna conducted during the period 1965-1969 on a complex of lakes with an artificially created horizontal thermal gradient, no influence was noted of heating the environment on the seasonal changeability scheme of the fauna. This influence did occur, however, in the transition of seasonal phenomena in time. Changes in the bottom fauna during successive years of the study showed a lack of influence of heating the environment on the range of relative fluctuations in the level of average numbers, but was evident in fluctuations of the size of individuals, qualitative composition, and rate of domination resulting from changed thermal conditions. (See also W77-06749 and W77-06751) (Katz)
W77-06750

THE INFLUENCE OF EFFLUENT HEATED WATERS ON THE BOTTOM FAUNA OF LAKES IN THE VICINITY OF KONIN III. AN EFFORT TO EXPLAIN THE CAUSES AND RESULTS OF CHANGES IN THE BOTTOM FAUNA OF LAKES AS INFLUENCED BY THE INFLOW OF HEATED WATERS, (IN POLISH),
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland). Zaklad Hydrobiologii.
L. Leszczynski.
In: Roczniki Nauk Rolniczych, Seria H, Rybactwo Vol 97(3), p. 49-68, 1976. 63 ref.

Descriptors: *Water pollution effects, *Thermal pollution, Water temperature, *Benthic fauna, Biological communities, Epilimnion, Seasonal, Mixing, *Diptera, *Oligochaeta, Lakes.
Identifiers: Annual fluctuations, Chaoborus, Accelerated development, Mobility, Tanypodinae, Ceratopogonidae, Polycentiopinae, Morphometry, *Poland(Konin area lakes).

Results obtained on an investigation of bottom fauna conducted on lakes with an artificially created horizontal thermic gradient were compared with data contained in literature. The obtained indices for changes resulting in the water environment as a result of increasing the temperature were verified on the basis of literature, and consideration also given to the causes (primary and secondary) and effects of changes in the bottom fauna. Descriptors: *Primary productivity, *Secondary productivity, Phytoplankton, *Zooplankton, *Water pollution effects, *Thermal pollution, Water temperature, Biological communities, Crustaceans, Eutrophication, Flow, On-site data collection, Lakes.
Identifiers: Summer stagnation, Water transparency, Predatory zooplankton, Non-predatory zooplankton, Ecological output index, Morphometry, Poland.

Measurements of phyto- and zooplankton production were carried out during the peak of summer stagnation in 1973 on three lakes heated by a thermal power plant. Results were compared with those obtained in 1966. Raising the water temperature around 4C resulted in an increase of primary production, high growth of numbers, biomass and production of non-preying zooplankton, as also in an increase in the effectiveness of the non-preying link. Increasing the time of water flushing rate in the basin (to around 3.5 days) led to a drop in primary production, and to an increase in non-preying zooplankton production and growth of ecological effectiveness in the non-preying link. As concerns the preying link, a drop in production and ecological effectiveness was noted. (Katz)

Descriptors: *Water pollution effects, *Thermal pollution, *Water temperature, *Electric power production, Water chemistry, Chemical analysis, *Electrolytes, *Conductivity, Phosphates, Nitrogen, Flow augmentation, Mine drainage, Industrial wastes, Lakes.
Identifiers: Mineral salts, Morphometry, *Poland(Konin area lakes).

the study deals with the evaluation of changes in the water chemism of lakes, heated by effluent heated waters from an electric power plant, and differentiated from a morphometric and trophic point of view. The studies were conducted over the period 1965-1974. A constant increase in the content of some mineral salts in the lakes was noted, as also in electrolytic conductivity. These changes were linked to the industrialization of the drainage basin of the lakes under study. (Katz)

OCCURRENCE AND GROWTH OF DREISSENA POLYMORPHA PALL. IN LAKES INCLUDED IN A COOLING SYSTEM, (IN POLISH),
Polish Academy of Sciences, Warsaw. Inst. of Ecology; and Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology.
A. Stanczykowska.
In: Roczniki Nauk Rolniczych, Seria H, Rybactwo Vol 97(3), p. 109-122, 1976. 2 tab, 9 fig, 15 ref.

Descriptors: *Mollusks, *Larvae, *Growth rates, Zooplankton, Destratification, Water pollution effects, *Thermal pollution, *Water temperature, On-site data collections, Thermal stratification, Lakes.
Identifiers: *Age classes, *Life span, *Oxygen stratification, Shell size, Shell weights, *Poland(Konin area lakes).

Similar numbers of Dreissena polymorpha were noted in the five lakes of the Konin lakes complex, characterized by various water temperatures. However, the period of occurrence of larvae in the plankton is longer, and growth of adult individuals more rapid, in heated than in cool lakes. Snails from the warmer lakes grow more rapidly. Size and weight of Dreissena from the Konin lakes complex were less than those in the lakes of the Mazurian lakes complex. Life span in the most highly heated canal was shorter by one year than those in the other lakes of the Konin lakes complex. (Katz)

LONG-TERM CHANGES OF THE PELAGIC PRIMARY PRODUCTION IN HEATED LAKES, (IN POLISH),
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland). Zaklad Hydrobiologii.
B. Zdanowski.
In: Roczniki Nauk Rolniczych, Seria H, Rybactwu Vol 97(3), p 123-139, 1976. 3 tab, 3 fig, 38 ref.

Descriptors: *Primary production, *Phytoplankton, Water pollution effects, *Thermal pollution, *Water temperature, *Electric power production, *Eutrophication, Mesotrophy, Flow augmentation, Cycling nutrients, On-site data collections, Lakes, Measurement.
Identifiers: *Poland.

Measurements of the primary production of phytoplankton were carried out during the period 1967-1973, in the pelagic waters of two lakes heated by thermal effluents discharged by an electric power plant. Heating of waters resulted in an increased primary production (by about 50%), changes of its vertical distribution, and changes in the share of respiration in gross primary production. Decrease of the detention time in the lake (exchange of the total volume of water in lakes 3.5 days) restricted the intensity of production. (Katz)

THE INFLUENCE OF HEATED EFFLUENT WATERS ON THE THERMAL-OXYGEN RELATIONS AND WATER TRANSPARENCY IN THE KONIN LAKES COMPLEX, (IN POLISH),
Instytut Rybactwa Srodladowego, Olsztyn-Kortowo (Poland). Zaklad Hydrobiologii.
B. Zdanowski, and A. Korycka.
In: Roczniki Nauk Rolniczych, Seria H, Rybactwu Vol 97(3), p 141-164, 1976. 2 tab, 12 fig, 21 ref.

Descriptors: *Water pollution effects, *Thermal pollution, *Water temperature, *Electric power production, *Cooling water, Epilimnion, Stratification, Thermal stratification, Oxygen, Seasonal, Primary productivity, Lakes.
Identifiers: Morphometry, Water transparency, Summer stagnation, Reverse stratification, Surface inflow, Cascade inflow, Oxygen stratification, *Poland(Konin area lakes).

Results of seasonal observations on thermal-oxygen relations and water transparency of five lakes heated by an electric power plant are given. Heating of three lakes (1965-1969) resulted in considerable thermal variability between them, which decreased following inclusion of the whole lake complex in the cooling system of the power plant (1970-1973). Apart from the influence of the absolute amounts of heated effluents and air temperature, morphometric factors were decisive for the temperature level of the lakes, such as their maximal and average depths, and their surface. The influence of high temperature in shallow lakes was noted throughout the volume of the water body, while in deep ones only the epilimnion layers were affected. (Katz)

ADSORPTION OF POLYCHLORINATED BIPHENYL (AROCLOR 1254) ON SHRIMP,
Louisiana State Univ., Baton Rouge. Dept. of Food Science.
M. A. Khan, R. M. Rao, and A. F. Novak.
Bulletin of Environmental Contamination and Toxicology, Vol 16, No 4, p 503-504, 1976. 1 tab, 2 ref.

Descriptors: *Crustaceans, *Shrimp, *Shellfish, *Path of pollutants, *Adsorption, *Aroclor, *Polychlorinated biphenyls, Food chains, Pesticides, Chlorinated hydrocarbon pesticides.

Peeled, deheaded and deveined shrimp and unpeeled shrimp were dipcoated in 100 ppm solution of Aroclor 1254 for one minute. Values of adsorbed PCB averaged 33.2 and 26.3 micrograms per 100 grams solids for unpeeled and peeled shrimp, respectively, showing a significant statistical difference. This indicates a possible site of PCB accumulation, especially in shrimp and possibly in other marine animals with outer shells. It also suggests a careful utilization of shrimp waste as feed for fish or other animals. (Katz)
W77-06758

INDUCTION OF HEPATIC MICROSOMAL ENZYMES BY AROCLOR 1254 IN ICTALURUS PUNCTATUS (CHANNEL CATFISH),
Texas A and M Univ., College Station. Dept. of Veterinary Physiology and Pharmacology.
D. W. Hill, E. Hejtmancik, and B. J. Camp.
Bulletin of Environmental Contamination and Toxicology, Vol 16, No 4, p 495-502, 1976. 2 tab, 16 ref.

Descriptors: *Respiration, *Bioassay, *Absorption, *Aroclor, *Polychlorinated biphenyls, *Channel catfish, *Cytological studies, *Metabolism, *Enzymes, *Pesticides, *Fish physiology, Chlorinated hydrocarbon pesticides, Freshwater fish, Water pollution effects.
Identifiers: *Mitochondria, *Sublethal effects.

Aroclor 1254, a polychlorinated biphenyl, concentrates in the liver and brain of channel catfish, with signs of liver disfunction. After exposure to 2 ppm Aroclor 1254 for 24 hours and 48 hours, examination of test fish showed maximum concentration of PCBs was obtained in all tissues after 12 hours. The level of PCB was maintained for 480 hours with no apparent change in tissue distribution. The effect of Aroclor 1254 on hepatic microsomal enzyme activity and mitochondrial respiration was tested after exposure of test fish to 1 ppm Aroclor 1254 for 96 hours. Both aminopyrine N-demethylase and aniline hydroxylase activities were significantly increased over the control fish by 68.4% and 47.5% respectively. No inhibition of mitochondrial respiration was observed. It must be concluded that Aroclor 1254 at moderate concentrations does not affect electron transport or oxidative phosphorylation in liver mitochondria and therefore, does not interfere with the aerobic synthesis of ATP. (Katz)

UOKANT U. OF I. URBANA-CHAMP. ...

NOTES ON THE NESTING SUCCESS AND FECUNDITY OF THE ANEMONEFISH AMPHIPRION CLARKII AT MIYAKE-JIMA, JAPAN,
Tatsuo Tanaka Memorial Biological Station, Tokyo (Japan).
L. J. Bell.
Japanese Journal of Ichthyology, Vol. 22, No. 4, p 207-211, March 1976. 1 fig, 1 tab, 8 ref.

Descriptors: *Reproduction, Biological properties, *Fecundity, Spawning, Incubation, Hatching, Fish, Asia, Water pollution effects, Islands.
Identifiers: *Anemonefish, *Japan(Miyake-jima).

At Miyake-jima, Amphiprion clarkii spawns from May to September with a nesting frequency of 6-8 times/year. The incubation period varied from 6 1/2 days to 12 1/2 days. In the seven 6 1/2 day examples, temperatures ranged from 26.5-27.5C. The 12 1/2 day period was in the midst of a long period of cold water which varied from 19-23C for the first ten days of incubation, then rose abruptly to 26C, after which the eggs quickly developed and hatched. Egg counts resulted in an estimated fecundity of approximately 1,100-2,500 eggs per spawning. 94.8% of nests under observation were successful. (Chilton-ORNL)

THE MEASUREMENT OF TEMPERATURE TOLERANCE: VERIFICATION OF AN INDEX,
Maryland Univ., Baltimore County, Baltimore. Dept. of Biological Sciences.
B. P. Bradley.
Limnology and Oceanography, Vol. 21, No. 4, July 1976, p 596-599, 2 tab, 7 ref.

Descriptors: *Environmental effects, *Temperature, Resistance, Measurement, Forecasting, Copepods, *Pollutant identification, *Bioassay, *Bioindicators, Water pollution effects.
Identifiers: Shock-recovery assay, Eurytemora affinis.

A shock-recovery assay for temperature tolerance is demonstrated to predict survival of Eurytemora affinis at high temperatures. It is possible to modify the assay to allow comparisons between widely divergent treatment groups. Time to succumb (TS) and time to recover (TR) were observed over a 30-min period at a temperature of 34.5C (about 15C above the temperature at which the animals were raised and about 5C higher than any temperature normally encountered. The index of temperature tolerance was 30 plus TS minus TR, since time to succumb was positively related and time to recover was negatively related to temperature tolerance. The repeatability of the index was measured by testing animals and then retesting after a 1-h period at room temperature. The correlation between index values on the same animal was a measure of the reliability of the index. (Chilton-ORNL)
W77-06764

ENVIRONMENTAL FACTORS AFFECTING SURVIVAL AND GROWTH OF VIBRIO PARAHAEMOLYTICUS. A REVIEW,
Georgia Univ., Experiment. Div. of Food Science.
L. R. Beuchat.
Journal of Milk Food Technology, Vol 38, No 8, August 1975, p 476-480, 48 ref.

Descriptors: *Environmental effects, *Mortality, *Animal growth, Temperature, Salinity, Hydrogen ion concentration, Dehydration, Drying, Resistance, Water pollution effects.
Identifiers: *Vibrio parahaemolyticus.

The response of V. parahaemolyticus was found to be dependent upon interactions between chemical and physical forces. The organism is sensitive to both heat and cold, generally displaying more resistance to freezing than chilling. Its resistance to potentially lethal extremes in temperature is greatly affected by the chemical makeup of the medium in which the organism is treated. It is sensitive to desiccation and grows best in a medium containing about 3% sodium chloride. It prefers an alkaline pH for growth, but is most resistant to heat at pH 7.0. (Chilton-ORNL)
W77-06765

GROWTH AND MOVEMENT OF FISH IN THE VICINITY OF A THERMAL DISCHARGE,
Aquinas Coll., Grand Rapids, Mich.
R. S. Benda.
Indiana Academy of Science Procedings, Vol 83, 1974, p 185-191, 5 tab, 19 ref.

Descriptors: *Environmental effects, *Thermal pollution, Water pollution, Thermal stress, Powerplants, Discharge(Water), Fish, Movement, Growth rates, *Indiana, Rivers.

During the two year study, average temperature elevation ranged from less than 1F the first year to 3F the second year. During normal plant output (2 units operating) a temperature change of 20F with a rate flow of 675 cubic feet/second was found. Maximum discharge temperatures reached over 100F and cooled gradually downstream. Data indicated that a majority of the centrachids remained in the same areas as originally found and moved away from rather than towards the heated water. No significant difference were observed in the growth rates of longear sunfish, green sunfish, bluegill, spotted bass, white crappie, and black crappie from separate areas. A comparison of the growth rates of these species with the same species in other areas in the midwest showed tht the White River specimens fit within the range of established growth rates for the region. (Chilton-ORNL)

TEMPERATURE RELATIONS OF PUGET SOUND THAIDS IN REFERENCE TO THEIR INTERTIDAL DISTRIBUTION,
Western Washington State Coll., Bellingham. Dept. of Biology.
M. D. Bertness, and D. E. Schneider.
The Veliger, Vol 19, No 1, July 1976, p 47-58, 9 fig, 2 tab, 33 ref.

Descriptors: *Environmental effects, *Distribution patterns, Temperature, *Snails, Intertidal areas, *Washington.
Identifiers: Thais lamellosa, Thais emarginata, Puget Sound(Wash).

Populations of Thais lamellosa and Th. emarginata were found to exhibit intraspecific shore-level size gradient patterns which place the smaller individuals at the top of each species vertical range. The Th. emarginata population was found higher in the intertidal zone than the Th. lamellosa population. The lethal thermal limits of the 2 thaids revealed inter- and intraspecific differences in their tolerance with the Th. emarginata showing the greatest thermal resistance. Within the Th. lamellosa size classes the small snails had the highest thermal limits. Humidity was an important factor in the thermal limits. Respiratory response to temperature increase indicated that the Th. emarginata and the small size class within each species displayed the most pronounced temperature independence. It was concluded that the adaptations of both species to thermal stress which were shown in this paper probably do not play a major role in directly creating the observed distributional patterns. (Chilton-ORNL)

SEASONAL CHANGES IN THE RESPIRATION OF PUMPKINSEED, LEPOMIS GIBBOSUS, CORRELATED WITH TEMPERATURE, DAY LENGTH, AND STAGE OF REPRODUCTIVE DEVELOPMENT,
Massachusetts Univ., Amherst. Dept. of Zoology.
J. R. Burns.
Physiological Zoology, Vol 48, No 2, April 1975, p 142-149, 2 tab, 3 fig, 21 ref.

Descriptors: *Environmental effects, *Seasonal, *Temperature, Photoperodism, Reproduction, *Respiration, Fish, Physiology.
Identifiers: Lepomis gibbosus, *Pumpkinseed.

Seasonal changes in the respiratory rate of pumpkinseed, Lepomis gibbosus, measured at environmental temperature and photoperiod indicated that temperature, day length and reproductive state affected respiration. Temperature coefficients were calculated for the changes in respiration of adjacent months. Higher coefficients were observed at lower temperatures. A zone of relative temperature independence of the respiratory rate was observed between 14.2 and 19.7 C, minimally. During the reproductive season, respiration remained high in contrast to the expected effect of long day lengths, suggesting an influence of reproductive hormones on the respiratory rate. An effect of photoperiod was seen only for a short interval following spawning. Seasonal acute respiration at 17.5C was measured and showed inverse relationship between acclimatization temperature and respiratory rate except at the onset of the reproductive season when the respiration increased sharply. EFFECT OF TWO REARING CONDITIONS ON GROWTH AND BODY COMPOSITION IN CARP (CYPRINUS CARPIO L), (INFLUENCE DE DEUX MODES D'ELEVAGE SUR LA CROISSANCE ET LA COMPOSITION CORPORELLE DE LA CARPE COMMUNE),
Toulouse-3 Univ. (France). Laboratoire d'Ecophysiologie des Animaux.
G. Bouche, J. P. Parent, and A. Serfaty.
Journal of Physiology, Paris, Vol 70, 1975, p 659-668, 3 tab, 1 fig, 12 ref.

Descriptors: *Environmental effects, *Metabolism, Temperature, Seasonal, *Carp, Carbohydrates, Nitrogen, Animal growth, Fish.
Identifiers: RNA, DNA.

Carp were studied in natural ponds to determine the influence of seasonal changes on nitrogen and carbohydrate metabolism. Carp receiving industrial dried foods showed no measureable growth while those in natural habitats did exhibit growth. It was concluded that rebonucleic activity and protein metabolism were correlated with seasonal variations in water temperatures. (Chilton-ORNL)
W77-06769

THE ALGAL FLORA IN THE THERMAL BATHS OF MONTEGROTTO TERME (PADUA). ITS DISTRIBUTION OVER ONE-YEAR PERIOD,
Padova Univ. (Italy). Istituto di Botanica e Fisiologia Vegetale.
C. Andreoli, and N. Rascio.
Int. Revue ges. Hydrobiol. Vol. 60, No. 6, 1975, p 857-871, 1 tab, 2 fig, 28 ref.

Descriptors: *Environmental effects, *Temperature, *Thermal springs, *Algae, Distribution, Seasonal.
Identifiers: *Italy(Padua).

The algal microflora of a thermal spring and of thermal baths were studied to ascertain the existence of a seasonal succession, on the base of number and frequency qualitatively evaluated, of algal species. The pH and temperature of waters and muds as well as algae samples were collected from seven stations monthly. The thermal spring temperatures ranged from 65-75 C. Temperatures of the mud cisterns varied (euthermal 40-60 C, hypothermal 13-18 C, hyalothermal 18-30 C, eurithermal 30-50 C, and acrothermal over 50 C). Three Cyanophyceae species were quantitatively

more abundant the 64 species of Diatomeae. Among the most frequent species were found Melosira sol, M. granulata, Cocconeis placentula, Nitzschia denticula, Denticula elegans and D. tenuis. Other species were found irregularly. (Chilton-ORNL)

HEAT RESISTANCE OF GAMETES OF MARINE INVERTEBRATES IN RELATION TO TEMPERATURE CONDITIONS UNDER WHICH THE SPECIES EXIST,
Akademiya Nauk SSSR, Leningrad. Lab. of Comparative Cytology.
V. B. Andronikov.
Marine Biology, Vol. 30, 1975, p 1-11, 1 tab, 6 fig, 51 ref.

Descriptors: *Environmental effects, *Distribution patterns, Reproduction, Resistance, Heat resistance, Spawning, *Invertebrates, Marine animals, Temperature.
Identifiers: *Poikilotherms, Gametes.

A review is presented of known data on the heat resistance of gametes of marine invertebrates as well as presenting some new data. The heat resistance of gametes is concluded to be correlated with the degree of thermophily of the species concerned. Eggs, zygotes, and early stages of embryonic development of poikilotherms were found to be most susceptible to heat injury. The upper thermal limit for the normal development of eggs and embryos was found to be only 1-3C higher than ambient temperatures. It was concluded that the heat resistance level of gametes and embryos represents an adjustment to temperatures at which spawning, fertilization and earlier embryonal development occur. Temperatures which exceed the upper or lower thermal limits throughout the year act as limiting factors for species distribution. (Chilton-ORNL)
W77-06771

EFFECT OF SALINITY ON SPORE GERMINATION OF TERRESTRIAL AND MARINE FUNGI,
Portsmouth Polytechnic (England) Dept. of Biological Sciences.
P. Byrne, and E. B. G. Jones.
Trans. Br. Mycol. Soc., Vol. 64, No. 3, 1975, p 497-503, 2 fig, 2 tab, 16 ref.

Descriptors: *Environmental effects, *Salinity, *Temperature, *Spores, Germination, *Fungi, Aquatic fungi, *Marine fungi, Freshwater, Terrestrial habitats, Water pollution effects.

Eleven terrestrial, freshwater, and marine fungi were investigated to determine the combined effect of salinity and temperature on spore germination. Spore germination in terrestrial fungi was found to decrease with increasing salinities with the effect being greater at low temperatures. The freshwater hyphomycete T. setigerum exhibited a broad tolerance to salinity at 20 and 25 C although increasing salinities caused a slight reduction. The marine fungi exhibited a wide tolerance to salinity at each temperature. It was suggested that the percentage spore germination decrease with increasing salinities for terrestrial fungi may explain why so few terrestrial fungi are found in the sea but that the effect of salinity on vegetative growth and reproduction, temperature requirements, availability of suitable substrates for colonization and spore dispersal may also be responsible factors. (Chilton-ORNL)
W77-06772

DISPERSAL AND DISPERSION OF POND SNAILS IN AN EXPERIMENTAL ENVIRONMENT VARYING TO THREE FACTORS, SINGLY AND IN COMBINATION,
Iowa Univ., Iowa City. Dept. of Zoology; and Iowa Univ., Iowa City. Lakeside Lab.
R. V. Bovbjerg.
Physiological Zoology, Vol. 48, No. 3, July 1975, p 203-215, 9 fig, 18 ref.

Descriptors: *Environmental effects, *Distribution patterns, Dispersion, *Snails, Thermal stress, Vegetation, Laboratory tests, Water pollution.
Identifiers: Carrion.

The positions of pond snails in a laboratory environment were mapped at the end of a 1 h observation period. Experiments varied in three environmental factors: presence and absence of vegetation, of animal carrion, and a thermal gradient. In the presence of single factors, the snails responded with a kinesis to an aggregation on vegetation, a negative thermotaxis from high temperature, and a strong chemotaxis toward animal carrion. In combination, vegetation tended slightly to mask the aggregations on carrion and in the cooler water. A strong synergism was evident in aggregation on carrion in cooler water. It was concluded that this simulation supported the original assumption that animals would respond to the various factors by locomotion either away from or toward the environmental factors and would form a pattern of dispersion related to that of environmental patchiness. (Chilton-ORNL)
W77-06773

HEALTH EFFECTS OF MULTIPURPOSE USE OF WATER,
Stockholm Univ. (Sweden). Wallenberg Lab.
E. Arrhenius.
Ambio, Vol. VI, No. 1, 1977, p. 59-62, 31 ref.

Descriptors: *Environmental effects, *water pollution effects, *Public health, Water pollution control, Mercury, Cadmium, Radioisotopes, Pollutants.
Identifiers: Eternal pollutants.

Different types of contaminants which constitute health risks and the countermeasures against various pollutants are discussed. The focus is on what is termed eternal pollutants which are defined as pollutants which have their toxic properties inherent in the atoms themselves and can thus not be chemically destroyed. It is concluded that the only way in which these pollutants can be temporarily eliminated is through their being shunted into non-biological isolation where they are not recirculated. It is also concluded that the ultimate goal for handling of eternal pollutants must be to avoid any release of those which have no positive biological effects and to substitute all processes involoving these chemicals with alternative processes in which less harmful substances can be used. (Hilton-ORNL)

LONG-TERM LEAD ACCUMULATION IN ABALONE (HALIOTIS SPP.) FED ON LEAD-TREATED BROWN ALGAE (EGREGIA LAEVIGATA),
Scripps Institution of Oceanography, La Jolla, Calif.
J. Stewart, and M. Schulz-Baldes.
Marine Biology, Vol. 36, 1976, p 19-24, 2 tab, 4 fig, 18 ref.

Descriptors: *Environmental effects, Absorption, *Lead, Algae, Foods, Path of pollutants, Water pollution, *Phaeophyta.
Identifiers: *Abalone, Haliotis rufescens, Egregia laevigata.

Forty juvenile Haliotis rufescens were individually tagged, weighed, and apportioned into three tanks. Twenty of the abalone after 3 months and twenty after 6 months were analyzed for lead content in their total soft parts. After 3 months and twenty after 6 months were analyzed for lead content in their total soft parts. After 3 months, abalone fed on algae grown in an environment to which no lead had been added contained slightly less lead than those fed algae grown in an environment to which 0.1 mg 1(-1) PbC12 had been added. Specimens fed on algae grown in an environment to which 1.0 mg 1(-1) PbC12 had been added showed distinctly greater accumulations of lead. After 6 months, abalone fed on algae pretreated with 1.0 mg Pb 1(-1) accumulated up to 21 micrograms Pb g(-1) wet weight. The lead was selectively concentrated in the digestive gland with only negligible amounts being found in the muscle tissue. (Chilton-ORNL)

REPRODUCTIVE CYCLE OF TROUT AND TENCH: EFFECT OF EXPERIMENTAL VARIATIONS OF THE TEMPERATURE, (ETUDE SUR LE CYCLE REPRODUCTEUR DO LA TRUITE ARC-EN-CIEL ET DE LA TANCHE: EFFET DE VARIATIONS EXPERIMENTALES DE LA TEMPERATURE),
Institut National de la Recherche Agronomique, Jouy-en-Josas (France). Laboratoire de Physiologie des Poissons.
B. Breton, B. Jalabert, A. Fostier, and R. Billard.
Journal of Physiology, Paris, Vol. 70, 1975, p 561-564, 1 tab, 5 ref.

Descriptors: *Environmental effects, *Laboratory tests, Physiology, *Reproduction, *Temperature, *Trout.
Identifiers: Hormones, Gonadotropin, *Tench.

Temperature elevations of 3 and 6 C (in conditions where ycthemeral and seasonal rythmicity were maintained) resulted in a significant increase in fertility with the increase in temperature. The first spawning period was found to be earlier and a rise in the number of spawnings was observed. This effect of temperature was said to act at the level of the hypothalamo-pituitary system. At the time of spermatogonia divisions a rise in the plasma gonadotropin levels was found. (Chilton-ORNL)

HEAVY METAL CONCENTRATIONS IN WATER, SEDIMENTS, AND FISH FROM MEDITERRANEAN COASTAL AREA, ISRAEL,
Israel Oceanographic and Limnological Research Ltd., Haifa. Haifa Labs.
I. Roth, and H. Hornung.
Environmental Science and Technology, Vol. 11, No. 3, March 1977, p 265-269, 8 tab, 44 ref.

Descriptors: *Water pollution effects, *Environmental effects, Toxicity, Absorption, Heavy metals, Water pollution sources, Water, Sediments, Fish, Coasts, Pollutant identification.
Identifiers: Israel, *Mediterranean Coast(Israel).

The concentration of the heavy metals investigated (Cadmium, Lead, Copper, Zinc, Mickel, Chromium) both in water and sediments is similar to those found in literature for unpolluted regions. Analyses of the edible muscle tissue of the 12 most common commercial fish showed low concentration levels of the metals. The area where the investigations were conducted (Israel) is still relatively unpolluted and continued monitoring of the heavy metal concentrations is recommended. (Chilton-ORNL)

LABORATORY STUDIES ON THE EFFECT OF METALS ON OXYGEN UPTAKE BY SEWAGE SLUDGE IN BRACKISH WATER,
Bristol Univ. (England). Dept. of Bacteriology.
A. J. Sylvester, and G. C. Ware.
Marine Pollution Bulletin, Vol. 8, No. 2, February 1977, p 45-48, 4 fig, 1 tab 9 ref.

Descriptors: *Environmental effects, *Laboratory tests, Heavy metals, *Sewage sludge, Water pollution effects, Water pollution sources, Industrial wastes, Cadmium, Zinc, Lead, Oxygen, Oxygenation, Respiration, *Metals, Brackish water.

All experiments showed an initial high rate of oxygen consumption by freshly diluted sewage sludge which was unaffected by the presence of 500 microg/mg streptomycin sulphate. The rate fell rapidly during the first few hours after dilution. In the absence of streptomycin the oxygen consumption rate recovered to a greater or lesser extend depending upon the concentration and type of metal ions present. When streptomycin was present no recovery in the rate of oxygen uptake was observed. After 12 h contact with the diluting water the rate of oxygen uptake of the sludge in the mixture containing 10 microg/l of cadmium was similar to the control. After this time and until completion of the experiment, the rate of oxygen uptake steadily increased. Similar results were obtained with lead. A stimulatory effect was observed in lead concentrations of 200 microg/l. At concentrations of 500 microg/l, zinc had a stimulating effect after 48 h contact. (Chilton-ORNL)

RESPIRATORY RESPONSE OF CUNNERS TO SILVER,
National Marine Fisheries Service, Milford, Conn. Middle Atlantic Coastal Fisheries Center.
F. P. Thurberg, and R. S. Collier.
Marine Pollution Bulletin, Vol. 8, No. 2, February 1977, p 40-41, 1 tab, 11 ref.

Descriptors: *Environmental effects, *Respiration, Heavy metals, Mercury, Cadmium, Fish, Water pollution effects.
Identifiers: *Cunners, *Silver.

After exposure to concentrations of 0.12, 0.25 and 0.50 ppm silver nitrate for 96 h, gill-tissue oxygen consumption measurements were made. Exposures to concentrations as low as 0.12 ppm resulted in significant respiratory depression. Depressed gill-tissue oxygen consumption rates was also found in cunners exposed to 50 and 100 ppb cadmium for periods of up to 60 days. Winter flounder and striped bass also show cadmium-induced depression of oxygen consumption but exposure to mercury resulted in elevated gill-tissue respiration rates. It was concluded that different metals have different effects on physiological stress indicators. (Chilton-ORNL)

HEAVY METALS IN MACROINVERTEBRATES AND FISH FROM THE LOWER MEDWAY ESTUARY, KENT,
Sir John Cass Coll., London (England). School of Sciences and Technology.
J. R. Wharfe, and W. L. F. Van Den Broek.
Marine Pollution Bulletin, Vol 8, No 2, February 1977, p 31-34, 1 fig, 2 tab, 10 ref.

Descriptors: *Environmental effects, *Heavy metals, Absorption, Fish, Invertebrates, Mercury, Copper, Zinc, Lead, Cadmium, Estuaries, Fish diets, Water pollution effects.
Identifiers: *Medway estuary(Eng).

Macroinvertebrates and fish were analyzed for mercury, zinc, copper, lead, and cadmium periodically from April 1973-January 1976. Levels of metals in animals from the lower Medway estuary were low, although higher values of lead and cadmium were found in the vicinity of industralized areas. Information on fish diets and the levels found in invertebrates showed little evidence of any accumulation, although it was noted that smaller size class of prey taken were not analyzed. Sediment and water samples were not analyzed. (Chilton-ORNL)

DISTRIBUTION AND INDICATORY VALUE OF THE SUBMERGED MACROPHYTES IN THE FLOWING WATERS OF THE FRIEDBERGER AU, (IN GERMAN),
Universitaet Hohenheim (Landwirtschaftliche Hochschule) (West Germany).
A. Kohler, R. Brinkmeier, and H. Vollrath.
Ber Bayer Bot Ges Erforsch Heim Flora 45, p 5-36, 1974.

Descriptors: *Calcium, *Eutrophication, Distribution, *Indicators, Water pollution effects, Plant physiology.
Identifiers: *Callitriche-Obtusangula, *Macrophytes(Submerged), West Germany(Friedberger Au), *Katharobic waters.

The waters studied were high in Ca content. Some macrophyte species were found only in pure waters; other occurred mainly in pure waters but also in eutrophic sections. Some were more evenly distributed between katharobic and lightly polluted waters and others occurred in moderately and heavily polluted but not in katharobic waters. The Friedberger Au (West Germany) contained 1 hydrophytes and the Moosach system had 21. Callitriche obtusangula was totally absent from the former area but was among the most dominant species in the latter.--Copyright 1976, Biological Abstracts, Inc.

A PILOT STUDY ON THE DESIGN OF A PETROLEUM HYDROCARBON BASELINE INVESTIGATION FOR NORTHERN PUGET SOUND AND STRAIT OF JUAN DE FUCA,
National Oceanic and Atmospheric Administration, Boulder, Colo. Marine Ecosystems Analysis Program Office.
W. D. MacLeod, D. W. Brown, and R. G. Jenkins.
NOAA Technical Memorandum ERL MESA-8, November 1976. 59 p, 18 fig, 12 tab, 11 ref, 2 append.

Descriptors: *Washington, *Coasts, *Baseline studies, *Water pollution effects, *Oil pollution, *Bioindicators, Sediments, Biota, *Mussels, *Snails, Analytical techniques, Organic compounds.
Identifiers: *Puget Sound, *Strait of Juan de Fuca, *Petroleum hydrocarbons, Residual hydrocarbons, Mytilus edulis, Mytilus californianus, Thais lamellosa.

Substantially increased petroleum tanker traffic, pipeline transport, and refining operations are anticipated in the region of Northern Puget Sound and Strait of Juan de Fuca when the Alaska pipeline comes into operation. To assess the potential future environmental impact arising from these activities current hydrocarbon baseline levels must be measured. This report presents the results of the pilot study and offers recommendations for a first year Petroleum Hydrocarbon Baseline Investigation. The pilot study has demonstrated that methodology exists to detect and measure a number of hydrocarbons in sediments, mussels (Mytilus edulis and Mytilus californianus), and a snail (Thais lamellosa). Appendices identify critical intertidal sites for further study and recommends analytical procedures best suited to the particular environment. (NOAA)

Sea Grant Program Report No. MITSG 77-4, Index No. 77-304 -Nnt, January 1977. 93 p, 12 fig, 2 tab, 65 ref, 2 append. SG-04-6-158-44081.

Descriptors: *New Jersey, *North Carolina, *Oil spills, *Water pollution effects, Coasts, Estuaries, Environmental effects, Wildlife, Beaches, Economics, Baseline studies.
Identifiers: U.S. East Coast, Cape Hatteras, Historical background, Tankers, World War II.

The overall effects of spilled oil are studied through available data on tankers sunk along the East Coast of the United States during World War II. The baseline data of ships sunk, cargo, locations and data on sinkings was established through an extensive literature and archives search. Cape Hatteras, North Carolina and its surrounding area was chosen as the primary site of the investigation on the basis of the volume of spilled oil. A computer model was developed to estimate the trajectory of oil released from each ship. In addition, the Asbury Park area of New Jersey was investigated on the merit of substantial documentation of spills in that area. Interviews were conducted in both areas to obtain first hand information on visible effects of the oil. Newspapers and records of marine activities were analyzed to determine environmental and other oil related effects for the selected regions. Results indicated that effects of the oil spills, as observed by residents of the areas under investigation, were negligible. In both cases, regional wildlife and economy survived with minimal difficulty. (NOAA)

EFFECTS OF ENGINEERING ACTIVITIES ON THE ECOLOGY OF PISMO CLAMS,
Moss Landing Marine Labs., Calif.
J. Nybakken, and M. Stephenson.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-016 948, Price Codes: A04 in paper copy, A01 in microfiche. Coastal Engineering Research Center, Fort Belvoir, Virginia, Miscellaneous Paper No. 8-75, September 1975. 65 p, 21 fig, 9 tab, 62 ref, 1 append. Army DACW72-72-C-0016

Descriptors: *Clams, *Surveys, *Beaches, *California, Distribution patterns, Aquatic populations, Aquatic animals, Sediments, Water quality, Coastal engineering, Predation, Reproduction, Gonads, Aging(Biological), Growth rates, Marine biology, Water pollution effects.
Identifiers: *Monterey Bay(Calif), *Pismo clams.

Three aspects of the ecology of Pismo clams were investigated in Monterey Bay, California: distribution, reproduction cycle, and age and growth. Pismo clam populations were found to be restricted to bay areas between the Salinas River and Santa Cruz. Highest densities recorded wer intertidal, and subtidal clam beds were few and with low densities. Most clams appeared randomly dispersed, and different size classes did not show a vertical separation. The presence and absence of clams were shown to be correlated with beach slope and grain size. Pismo clams mature in their second year in Monterey Bay, and the primary spawning time is in September and October. The growth rate is more rapid in young clams and varies throughout the year in all size classes but is most rapid in the summer and fall. The results of this 2-year study can serve as a guide in sampling Pismo clam populations along the California coast; the density and distribution of the clam in Monterey Bay, and knowledge of spawning times can aid in project planning to avoid harming an important fishing resource. (Sims-ISWS)

Limnology and Oceanography, Vol. 22, No. 1, p 1-9, January 1977. 2 fig, 1 tab, 38 ref. NSF GA-19380, GA-41209.

Descriptors: *Methane, *Bacteria, *Methane bacteria, *Microbial degradation, *Water pollution sources, Gases, Microorganisms, Water pollution, Sulfates, Microbiology, Sulfur bacteria, Sediments, Microbiology, Sulfur bacteria, Sediments, Sulfur compounds, Marine bacteria, Water quality, Aquatic habitats.
Identifiers: *Methane oxidizing bacteria, *Methane producers, *Methane formation, Sulfate concentration, Sulfate reducers, Methane distributions, Marine environments, Microbial ecology, Marine systems.

A survey of reported methane distributions in sediments and the adjacent overlying water showed distinct differences between freshwater and marine environments. These differences may be explained by the activities of sulfate-reducing bacteria and appear to be the result of differences in sulfate concentration between freshwater and marine environments. A PRELIMINARY EVALUATION OF THE EFFECTS OF GAS BUBBLE DISEASE ON FISH POPULATIONS IN THE KOOTENAI RIVER BELOW LIBBY DAM,
Army Engineer District, Seattle, Wash. Seattle District.
B. May.
Presented at the 25th Annual Meeting, Western Division, American Fisheries Society, July 13, 1973, 13 p., 5 tab., 2 ref. DACW 67-73-C.

Descriptors: *Trout, Freshwater fish, *Supersaturation, Fish populations, Freshwater fish, *Fish behavior, On-site investigations, Bioassays, Mortality, *Fish disease, Fish pathology, Rainbow trout, Dams, Dam sites, *Montana.
Identifiers: Fish, Game fish populations, *Kootenai River(Mont), *Mountain whitefish, Prosopium, *Cutthroat trout, *Gas bubble disease, Libby Dam(Mont), Creel Census, Recreational fishery.

Game fish populations have been adversely affected by supersaturated gases in the Kootenai River for at least five or six miles below Libbly Dam. The spawning run of Mountain whitefish (Prosopium williamsoni) from the Kootenai River into the Fisher River was adversely affected by gas bubble disease. An unusually large drawdown of the reservoir in the winter of 1972-73 triggered the movement of large numbers of cutthroat trout (Salmo clarki) and mountain whitefish downstream out of the reservoir area. These fish provided an excellent fishery during February of 1973, but masked the effect of supersaturated gases upon fish populations in the first six miles of the Kootenai River below Libby Dam. Mountain whitefish, appear to be more sensitive than cutthroat trout to supersaturated gas conditions. Depth, cold water temperatures and the influence of tributary streams allow some fish to survive for several months or more in areas of the river where total gas concentrations are above 130 percent saturation. (Katz)

OCCURRENCE OF GAS-BUBBLE DISEASE IN THREE SPECIES OF BIVALVE MOLLUSCS,
Delaware Univ., Lewes. Field Station.
R. Malouf, R. Keck, D. Maurer, and C. Epitanio.
Journal of the Fisheries Research Board of Canada, Vol. 29 (1972), p. 588-589, 2 fig., 4 ref.

Descriptors: *Oysters, Commercial shellfish, Mollusks, *Diseases, Clams, Sea water, *Heated water, Atmospheric gases, *Supersaturation, *Animal pathology, *Aquiculture.
Identifiers: *Gas bubble disease, Bivalve molluscs, Conchiolin blisters, Mantle tissue, *Dissolved gas content, Crassostrea gigas, Mercenaria mercenaria.

Gas-bubble disease was observed in adult oysters and hard clams held in heated running sea water during the winter. Heating the cold sea water in closed heat exchangers caused it to become supersaturated with atmospheric gases. Exposure of the animals to this water the formation of gas-filled conchiolin blisters on the valves of the oysters. Bubbles of gas were observed in the gill gilaments of the oysters and clams and in the mantle tissue of the oysters. Any method, such as the use of baffles or an aerated head tank, that reduces the dissolved gas concentration in the water will help prevent the diseases. (Katz)

FIRST REPORTED INCIDENCE OF GAS-BUBBLE DISEASE IN THE HEATED EFFLUENT OF A STEAM GENERATING STATION,
North Carolina Wildlife Resources Commission, Raleigh. Div. of Inland Fisheries.
D. J. DeMont, and R. W. Miller.
In: Proceedings of the Twenty-Fifth Annual Conference, Southeastern Association of Game and Fish Commissions, October 1971, p. 392-399, 2 tab., 3 fig., 15 ref.

Descriptors: *Fish diseases, Warm water fishes, *Thermal pollution, Thermal power plants, Thermal water, Warm water fish, Freshwater fish, *Fish pathology, Industrial effluents, *Fish kill, Mortalities, *Environmental effects, Water pollution effects, White bass.
Identifiers: *Gas bubble diseases, *Steam generating stations, *Pop-eye, Threadfin shad, Bluegill, Black crappie, Gas emboli, Gills.

During the winter of 1970-71, thirteen species of warm-water fishes exhibited external symptoms of gas-bubble disease (mostly 'pop-eye') in the discharge canal and cove of a stream generation station. Peak monthly incidences were 70.8, 33.3 and 23.5 percent for white bass, threadfin shad and bluegill, respectively. Forty-nine percent of the bluegill in excess of 4 inches were afflicted whereas only 4.4 percent of those under 4 inches exhibited symptoms. Among the bluegill, the right eye only symptoms were more prevalent than were the left eye only symptoms at the 97.5 percent confidence level. Dead fish, principally black crappie, observed in the discharge in February 1971, did not exhibit external symptoms of gas bubble disease. However, autopsies of dying black crappie revealed gas emboli in the larger vessels of the gill fragments. (Katz)

THE SOLUBILITY OF NITROGEN, OXYGEN AND ARGON IN WATER AND SEAWATER,
Scripps Institution of Oceanography, La Jolla, Calif.
R. F. Weiss.

Deep-Sea Research, Vol. 17, 1970, p. 721-735, 11 tab., 4 fig., 24 ref.

Descriptors: *Nitrogen, *Oxygen, *Argon, *Seawater, Atmosphere, *Solubility, Thermodynamics, Temperature, Salinity, Water quality, Atmospheric pressure.
Identifiers: Distilled water, Bunsen solubility coefficient, *Solubility equations, *Nitrogen solubilities, *Oxygen solubilities, *Argon solubilities.

Recent precise data on the solubilities of nitrogen, oxygen and argon in distilled water and seawater are fitted to thermodynamically consistent equations by the method of least squares. The temperature dependence of the Bunsen-solubility coefficient is treated using the integrated van't HOff equation. It is shown that the Setchenow relation gives an adequate representation of the salting-out effect. Equations expressing the solubilities of these gases, as a function of temperature and salinity, in units of the Bunsen coefficient, ml/l, and mlkg are given along with solubility tables in each of these units. (Katz)

OBSERVATIONS ON GAS BUBBLE DISEASE IN ADULT COLUMBIA RIVER SOCKEYE SALMON (ONCORHYNCHUS NERKA),
Pacific Northwest Water Lab., Corvallis, Oreg.
G. R. Bouck, G. A. Chapman, P. W. Schneider, Jr, and D. L. Stevens.
Pacific Northwest Water Laboratory, 1970, 11 p., 3 tab., 9 ref.

Descriptors: Salmon, *Anadromous fish, *Columbia river, *Fish migration, *Animal pathology, Fish disease, *Supersaturation, Laboratory tests, Bioassays, Mortality, *Nitrogen, Water quality, Water pollution effects, Methodology, *Fish diseases, *Sockeye salmon.
Identifiers: *Nitrogen, Supersaturation, *Gas bubble disease, External symptoms.

Gas bubble disease was confirmed in 1968 among wild adult sockeye salmon that were migrating upstream through the Columbia River. Adult fish had macroscopic gas bubbles in the skin and fins, and microscopic gas bubbles in the spleen and other organs. A similar survey in 1969 determined that gas bubble disease existed in at least 13 of a sample of 129 adult sockeye; 123 of these fish were randomly assigned to and then held at four temperatures in air-equilibrated water and the development of eye damage was noted. At temperatures below (10C) or at (16C) ambient river temperatures, about one-third of the fish became blinded in one or both eyes and sustained low mortality. At 20 and 22C eye damage developed in 53 percent and 66 percent of the fish, respectively, and was associated with high mortality. The authors conclude that dissolved nitrogen gas is an important water quality parameter causing significant damage to salmon in the Columbia River. (Katz).

DISSOLVED NITROGEN, DISSOLVED OXYGEN AND RELATED WATER TEMPERATURES IN THE COLUMBIA AND LOWER SNAKE RIVERS, 1965-1969,
National Marine Fisheries Service, Seattle, Wash.
K. T. Beiningen, and W. J. Ebel.
Available from the National Technical Information Service, Springfield, VA 22161 as COM-71 00640, Price codes: A04 in paper copy, A01 in microfiche. April 1971. 60 p., 95 tab., 6 ref.

Descriptors: *Columbia River, *Dissolved oxygen, *Nitrogen, *Water temperature, On-site investigations, Laboratory analysis, *Water quality, Limnology, *Data collection, Data storage, Grand Coulee Dam, Spillway, Dams, Dam sites, Saturation, *Supersaturation.
Identifiers: *Lower Snake River.

Data on the dissolved nitrogen, dissolved oxygen, and water temperatures in the Columbia and lower Snake Rivers from 1965 through 1969 are presented. The data were compiled from field observations and from laboratory analysis of water samples collected at 40 stations. (Katz)
W77-06925

EFFECT OF ATMOSPHERIC GAS SUPERSATURATION CAUSED BY DAMS ON SALMON AND STEELHEAD TROUT OF THE SNAKE AND COLUMBIA RIVERS (A REVIEW OF THE PROBLEM AND THE PROGRESS TOWARD A SOLUTION, 1974),
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
W. J. Ebel, H. L. Raymond, G. E. Monan, W. E. Farr, and G. K. Tononaka.
Northwest Fisheries Center, Processed Report, January 1975, 111 p, 23 tab, 22 fig, 45 ref.

Descriptors: *Fish diseases, *Dams, Dam sites, *Salmon, Rainbow trout, *Columbia River, *Spillways, Fish migration, *Supersaturation, *Mortality, Animal population, Juvenile fish, Laboratory studies, On-site investigations, Spillway gates, Remedies, Nitrogen.
Identifiers: *Chinook salmon, *Steelhead trout, *Snake River, *Gas bubble disease, Nitrogen, Supersaturation, Spillway deflectors.

Dams constructed on the Columbia and Snake Rivers in the past decade have impounded most of the free flowing sections of these rivers and created a water condition that in high flow years is deadly to migrating salmon and steelhead trout. With high spills, the water becomes supersaturated with atmospheric gases to levels that are lethal to fish. In response to this problem, a major research effort is in progress which seeks to define the effects of supersaturation on fish and to develop methods of reducing supersaturation caused by dams. This report summarizes the present status of the research and the relation of our current information to the anadromous resources of the Columbia and Snake Rivers. Although our most complete information is on the salmon and steelhead runs of the Snake River, it is logical that the conclusions apply as well to the stocks of the upper Columbia River and to a lesser degree, to the runs entering the Columbia River below the Snake River. (Katz)

ALGAL SUPPLEMENT ENHANCEMENT OF STATIC AND RECIRCULATING SYSTEM,
South Carolina Wildlife and Marine Resources Dept., Charleston. Marine Resources Research Inst.
J. J. Manzi, and M. B. Maddox.
Reprinted from: Helgolander wiss. Meeresunters, Vol 28, p 447-455, 1976. 4 fig, 2 tab, 19 ref. Also as: SC Mar. Res. Ctr. Contrib. No. 65 and Brice Mar. Biol. Lab. Contrib. No. 43. SG 04-5-158-5, SG-04-6-158-44009.

Descriptors: *Monitoring, *Water quality, *Crustaceans, *Aquaculture, *Algae, Survival, Shellfish, Recirculated water, Sea water, *South Carolina.
Identifiers: *Macrobrachium rosenbergii, Phaeodactylum tricornutum, Prawns.

A comparative study of algal supplement enhancement of static and recirculating Macrobrachium rosenbergii larval culture was conducted. Algal supplements significantly increased larval survival in both static and recirculating culture systems. Algal supplements significantly increased postlarval production in both static and recirculating culture systems. There was no significant difference in either survival or postlarval production between algal supplemented static and recirculating culture systems. The rate of larval development was appreciably increased by the additions of an algal supplement. The chemical parameters of water quality monitored did not appear to be related to the algal supplement enhancement of M. rosenbergii larval culture. (NOAA)

MONROE RESERVOIR, INDIANA, PART I: HYDROLOGIC CIRCULATION, SEDIMENTATION, AND WATER CHEMISTRY PART II: NUTRIENT RELATIONS,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
K. M. Bradbury, M. J. Graham, R. V. Ruhe, W. Y. B. Chang, and D. G. Frey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 258, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No. 87. March 1, 1977, 117 p, 39 fig, 11 tab, 48 ref. OWRT B-074-IND(1).

Descriptors: *Lakes, *Lake sediments, *Aquatic productivity, *Eutrophication, *Deficient elements, *Sedimentation rates, *Water circulation, Soil types, Mestrophy, Oligotrophy, Reservoirs, Thermocline, Nutrients, Nutrient requirements, Sediment distribution, *Indiana, Baseline studies, Post-impoundment.
Identifiers: *Lake Monroe(Ind), Inflow-outflow.

Monroe Reservoir completed in 1965 is about 10 miles south of Bloomington, Indiana on Salt Creek. The drainage area is about 432 square miles, and has a surface water area of 16.8 square miles at the low-flow regulation pool level. The watershed is on Mississippian Age bedrock. The study was to develop baseline information relative to the hydrologic circulation, sedimentation, water chemistry, and nutrient relations for this body of water. Using a inflow-outflow storage model and assuming total exchange of water by this system, the water is replaced 1.15 times in 5 months or wholly replaced in 4.3 months. With an input-output sedimentation model, the annual sediment deposition rate was found to be 10 acre feet which is 1/100 of 1% of the total storage space. The annual accumulation in the reservoir is about 0.02 acre feet on 25.5 tons per square mile and calculation for the 11 year life of the lake the average thickness of the bottom sediments is 0.13 inches. Although the chemical composition varied at the several sources of inputs, the waters of Lake Monroe are 'soft'. Lake Monroe was determined to be upper mesotrophic in its general trophic condition. No micronutrients were found to be limiting for the growth of phytoplankton and evidence indicated that phosphorus rather than nitrogen was the limiting macronutrient. (Wiersma-Purdue)

PERSISTENCE OF POLIOVIRUS 1 IN SOIL AND ON VEGETABLES GROWN IN SOIL PREVIOUSLY FLOODED WITH INOCULATED SEWAGE SLUDGE OR EFFLUENT,
Food and Drug Administration, Cincinnati, Ohio. Virology Branch.
J. T. Tierney, R. Sullivan, and E. P. Larkin.
Applied and Environmental Microbiology, Vol 33, No 1, p 109-113, January, 1977. 3 fig, 3 tab, 23 ref.

Descriptors: *Viruses, *Sludge disposal, *Vegetable crops, *Vegetation, Sewage effluents, Drainage, Lettuce, Irrigation, Irrigation effects, Runoff, Soil types, Food chains.
Identifiers: Land disposal, *Poliovirus 1.

Studies were conducted to determine viral persistence in soil and on lettuce and radishes grown naturally in soil flooded with poliovirus-inoculated sewage. The results were compared with those from spray irrigation studies to investigate land disposal of sewage sludge and effluent. The average recovery of poliovirus from 100-gram soil samples was 82%. Plot runoff was periodically collected and monitored for virus. Data indicated that low virus levels were not detected. Laboratory studies indicated effective recovery efficiency until less than 100 PFU/100 grams were added to soil samples. No viruses were recovered at levels less than 10 PFU/100 grams of soil. A two week period was necessary before virus levels became undetectable and virus survival times determined in this study were probably minimum values. Recovery values would be different if sand or sandy soils were used at disposal sites. Other studies indicated that viruses percolate below the soil surface and that they are protected from the destructive effects of solar radiation and temperature. Results indicated that viruses may be present in soil and on crops harvested from land flooded with sewage sludge or effluent. It is possible that viruses are mechanically transmitted when these crops are harvested or consumed. Use of this method of sludge disposal might lead to contamination of the food chain but, if drainage could be controlled, use on vegetation other than in the food chain would be a beneficial disposal method. ANAEROBIC DIGESTION AND MEMBRANE SEPARATION FOR THE TREATMENT OF DOMESTIC SEWAGE,
Thayer School of Engineering, Hanover, N.H.
H. E. Grethlein.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-265 908, Price codes: A03 in paper copy, A01 in microfiche. New Hampshire Water Resources Research Center, Durham, Research Report No. 15, (1976). 26 p, 3 fig, 4 tab, 8 ref. OWRT A-034-NH(2).

Descriptors: *Anaerobic digestion, *Domestic wastes, *Waste water treatment, *Sewerage, Effluents, *Septic tanks, Membranes, E. coli, Turbidity, Phosphates, Nitrates, Biochemical oxygen demand, Nutrient removal.
Identifiers: *Anaerobic digesters.

A laboratory study was carried out on a new concept for treating domestic wastewater. It used a septic tank as an anaerobic digester, and a circulation loop which has a pump and a semipermeable membrane module. The flux was maintained by a cyclic operation for a flat sheet membrane model for 1500 hours, and 8300 hours for a Helicore Module. Not only were the turbidity and E. coli count zero in the effluent, but 85 to 95% BOD and 75% nitrate reduction were also observed. Phosphate reduction also occurred, but the reason for it is not clear. These results are encouraging enough to recommend further work.

N. L. Clesceri.
Rensselaer Polytechnic Institute FWI Report 76-10, February 1977. 24 p. 2 fig., 8 tab., 7 ref.

Descriptors: *Septic tanks, *Nutrient removal, *Soil types, Design, Phosphorus, Sorption, *New York, Sludge treatment, Waste water treatment.
Identifiers: *Lake George(New York).

Difference were examined in phosphorus sorption among soils representative of those found in the Lake George (New York) drainage basin and a rapid soil test was developed to estimate phosphorus sorption capacities of soils. The lake's drainage basin bedrock is close to the surface and has thin soil cover in many areas. Phosphorus sorption varied considerably with both soil type and soil horizons (i.e., the B horizon of each soil had a higher sorbing capacity than the C horizon) by a reference index using sorption at an equilibrium concentration of 6.2 ppm P (the approximate concentration of soluble orthophosphate in wastewaters). Data compiled on soil types can also be examined by length of time required to saturate a soil with P, using only one solution (20 ppm P) and a 15 minute shaking period. The resultant value can be used in conjunction with data on the design and use of a septic system to obtain relative estimates of the time required for saturation of the drain field with P (or the volume of soil needed in the drain field to allow operation of the system for a given number of years). (Auen-Wisconsin)

ADJUSTMENT COSTS AND OPTIMAL WASTE TREATMENT,
State Univ. of New York at Albany. Dept. of Economics.
J. D. Hartford.
Journal of Environmental Economics and Management, Vol. 3, No. 3, p. 215-225, 1976. 1 fig., 7 ref.

Descriptors: *Adjusted costs, *Waste treatment, *Optimization, *Model studies, *Waste water treatment, Regulation, Water quality standards, Pollution taxes(Charges), Economics, Marginal costs, Federal Water Pollution Control Act, Water pollution, Air pollution.
Identifiers: *Adjustment costs.

A policy of generally placing stricter standards on emissions and effluents and on ambient air and water quality, standards which take effect gradually over time, might be justified by one or more considerations raised in a study of the effect of adjustment costs on optimal levels of treatment. It is proposed that adjustment costs may be of significant practical importance in determining these levels over a given period of time. It is suggested that much of the future proposed levels of standards may not be reactions to estimated future increases in waste treatment, but simply a recognition that a more rapid approach to desired levels of waste treatment would entail excessive costs of adjustment. The problem of minimizing the present value of the sum of treatment plus damage plus adjustment costs is placed in a calculus-of-variations framework and the optimal time path of waste treatment is characterized as well as the corresponding optimal tax. An example involving Euler differential equation statements is used to illustrate some features of the optimal waste treatment problem presented in the equations developed for minimization of adjustment costs. A conclusion is that the public sector in the U.S. should balance additional adjustment costs against the extra total costs of pollution caused by not being at the desired long-run level of treatment and prevention, and to decide the rate at which waste neutralization levels should be changed. SEPTIC TANK STUDY IS OFF AND RUNNING.
Water Conditioning, Vol. 10, No 11, p 8, 18, January, 1977.

Descriptors: *Water softening, *Waste water treatment, *Septic tanks, *Sewage bacteria, Soil disposal fields, Brine disposal, Saline water.
Identifiers: *Regeneration brines, Septic system bacterial fauna.

A Water Quality Association study of the effects of domestic water softeners on septic tank disposal systems is being conducted by the University of Wisconsin's Small Scale Waste Management Project. Due to the fact that nearly 60% of all water softener regeneration and backwash wastes are disposed of in septic systems this study is of some importance to both the water conditioning and septic tank industries. Analysis of septic tank effluent will be obtained either through literature search or sample analysis to determine base line salt concentrations when water softeners are used in septic systems. These concentrations will be compared with the critical levels established for septic systems. These concentrations will be compared with the critical levels established for septic tank bacterial fauna and the soil absorption bed to determine harmful effects, if any. Concentrated brines can be toxic to microorganisms necessary for the breakdown of waste organic materials within the septic system. The retardation or loss of biological treatment would allow waste solids to build up until the system fails to effectively remove particulate matter. These solids would then be washed out onto the absorption field and hasten soil clogging. Some work has already been done by the U.S.

ACTIVATED SLUDGE TREATMENT OF HIGH STRENGTH NSSC MILL EFFLUENT,
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
P. H. M. Guo, W. K. Bedford, and B. E. Jank.
Technology Development Report EPS 4-WP-77-1, March, 1977, 76 p., 16 fig., 19 tab, 15 ref, 5 app.

Descriptors: *Activated sludge, Treatment, *Effluents, *Wastewater treatment, Pulp and Paper Industry, Performance, Foaming, Suspended solids, Aeration, *Pulp wastes, *Industrial wastes, Canada, Bioassay.
Identifiers: Neutral sulphite semi-chemical mills, Reactors.

Bench scale studies were carried out to investigate the feasibility of treating high strength Neutral Sulphite Semi-Chemical (NSSC) mill effluents using an activated sludge process. Wastewater from Domtar Packing Limited, Trenton, Ontario, was treated in a two-stage activated sludge system under different loading conditions. For comparison purposes, studies were conducted in a single-stage reactor operated as an extended aeration activated sludge system. Experimental results indicated that the activated sludge process was not suitable for the treatment of this wastewater. Sludge bulking, foaming and poor oxygen transfer were the major problems encountered. The high concentration of dissolved solids contributed significant error to the determination of suspended solids; however, a procedure was developed for adjusting values which were in error. Bioassay tests showed that untreated wastewater was toxic and activated sludge treatment did not significantly reduce the toxicity. (WATDOC)

DRYING POTATO WASTES FOR ANIMAL FEED AS AN ALTERNATIVE DISPOSAL METHOD.
Canadian Bio Resources Consultants Ltd., Surrey (British Columbia).
Economic and Technical Review Report EPS 3-WP-77-4, Environmental Protection Service, Fisheries and Environment Canada, Ottawa, Canada, March, 1977, 85 p., 10 fig., 9 tab, 9 ref, append.

Descriptors: *Drying, *Potatoes, Wastes, *Feeds, Disposal, Food processing industry, Nutrient requirements, Livestock, Methodology, Economic feasibility, Industrial wastes, *Solid wastes, Dehydration, Waste disposal.
Identifiers: Dryers.

The solid wastes produced by the potato processing industry contribute significantly, in some cases, to pollution of the environment. This study was undertaken to evaluate the potential for dehydrating these waste solids for use as an animal feed and, thus, reduce their disposal in environmentally unacceptable ways. This evaluation consisted of determining the marketability of dried potato waste in terms of conventional feedstuffs, assessing drying technology to determine systems applicable to dry potato processing waste, and assessing the potential market for a suitable drying system. The results of the study show that potato wastes can be dried economically and that the dried product can compete in the market as a high energy feed for ruminant animals. (WATDOC)

STATE-OF-THE-ART REVIEW OF PROCESSES FOR TREATMENT AND REUSE OF POTATO WASTES,
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
J. P. Stephenson, and P. H. M. Guo.
Economic and Technical Review Report EPS 3-WP-77-7, March, 1977, 84 p., 3 fig., 16 tab, 65 ref.

Descriptors: *Reviews, Potatoes, *Byproducts, Reverse osmosis, Food processing industry, Bibliographies, *Waste water treatment, Effluents, Waste disposal, Sludge, *Recycling, *Water reuse, Industrial wastes.
Identifiers: *Potato processing wastes.

A review of the literature pertinent to the production and treatment of potato processing wastes is presented. The report outlines the unit operations (fluming, washing, peeling, slicing and blanching) employed in the industry with emphasis being placed on the french fry and potato chip sectors. Data on the quantity and quality of wastes generated from each unit operation were collected and analyzed. Results reported in the literature were compared with those obtained from a questionnaire survey conducted in the Canadian potato processing industry in 1973. In-plant measures for water conservation, water recycle and by-products recovery have been demonstrated as potential methods for reduction of waste loads. Biological processes such as activated sludge systems, trickling filters, aerated lagoons, waste stabilization ponds and rotating biological contactors were reported to be feasible for the treatment of the potato wastes. Land application of sludges produced from biological treatment systems has been most common for sludge disposal. (WATDOC)

PROCEEDINGS TECHNOLOGY TRANSFER SEMINAR ON WASTE HANDLING, DISPOSAL AND RECOVERY IN THE METAL FINISHING INDUSTRY, NOVEMBER 12-13, 1975, TORONTO, ONTARIO.
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
Economic and Technical Review Report EPS 3-WP-77-3, 158 p., March, 1977.

Descriptors: *Waste disposal, *Metals, Recycling, Effluents, Mineral industry, Conferences, *Canada, *Waste water treatment.
Identifiers: Handling and recovery(Metals), *Metal finishing industry, *Technology transfer.

The Technology Transfer Seminar 'Waste Handling, Disposal and Recovery in the Metal Finishing Industry' was co-sponsored by the Environmental Protection Service, Environment Canada, the Automotive Parts Manufacturers' Association (Canada), and the American Electroplaters' Society. Topics related to recycle disposal and centralized treatment of metal finishing wastes, as well as the current status of government regulations. These proceedings include both the original papers presented by speakers at the seminar and transcripts of the extensive panel discussions which followed the presentations. Available technologies for water reduction in plating processes and various treatment operations, such as chemical precipitation, ion exchange, distillation and reverse osmosis, were reviewed and the economic and technical feasibility of recycling treated sludges and purified effluents was discussed. Much interest was expressed in the concept of centralized treatment plants, which are operating in Europe and, in particular, in Germany. The design, operation, maintenance and cost data for such plants are outlined along with discussions of sludge disposal problems. The possibility of applying this technology in Canada was discussed in relation to the current government attitudes towards the control of effluents from metal finishing operations. These proceedings reflect a balanced grouping of inputs from government, metal finishers, and technical experts. (WATDOC)

LITERATURE REVIEW OF WASTEWATER CHARACTERISTICS AND ABATEMENT TECHNOLOGY IN THE WOOD AND TIMBER PROCESSING INDUSTRY.
Economic and Technical Review, Report No. EPS 3- WP-77-2, Environmental Protection Service, Fisheries and Environment Canada, Ottawa, Canada, February, 1977, 70 p., 2 app., 4 fig., 15 tab, 155 ref.

Descriptors: *Reviews, *Bibliographies, *Waste water treatment, *Pulp and paper industry, Pollution abatement, Technology, Storage, Water pollution, Recycling, Performance, Operations, *Canada, Pulp wastes, Industrial wastes.
Identifiers: *Literature reviews.

Published information pertinent to wastewater characteristics and abatement technology in the wood and timber processing is reviewed. The function of this report is to provide a background to the pollution abatement program being conducted by Environment Canada in this field. A complete inventory of the treatment and disposal of wastewater is required for the Canadian industries in order that a detailed appraisal can be made of the situation. It would appear that research is still necessary to develop complete design criteria for the application of treatment alternatives which are based on the best practicable technology available. The report consists of four major sections: (1) Log Storage, (2) Veneer and Plywood, (3) Particleboard, and (4) Wood Preserving. Each major section is discussed in terms of: wastewater sources (the industrial use of water and generation of wastewater, identifying the source and types of contaminants), wastewater characteristics (amounts of contaminants discharged and the potential environmental problems thus created) and abatement technology (the best practicable abatement control currently available and the cur-

LIBRARY U. OF I. URBANA-CHAMP.

rent trends in industry). The conclusions reached are aimed at a preliminary assessment of the environmental status of the industry and identification of the significant information gaps. Recommendations concern the requirements for a comprehensive appraisal of the Canadian situation. (WATDOC)

LONDON'S STORMWATER PROBLEM,
Greater London Council (England). Water and Wastewater Section.
R. W. Horner, L. B. Wood, and L. R. Wroe.
Journal Water Pollution Control Federation, Vol. 49, No. 1, p 103-110, January, 1977. 1 fig, 2 tab, 3 ref.

Descriptors: *Storm water, *Storm runoff, *Drainage systems, *Floods, Urban drainage, Storm drains, Intercepter sewers, Combined sewers, Water quality, Analysis, Monitoring, Water quality.
Identifiers: London(England).

London's storm water problem and methods utilized to cope with it were reviewed. Six districts (central London, north-western, northern, north-eastern, south-eastern, and south-western) were described by characteristics of population, storm water conditions, and sewerage/drainage systems. A 'standard storm' was selected to estimate storm water quantities discharged to rivers and streams for comparison of districts on a common basis. Instruments have been added at pumping stations, discharge mains, and culverts for water quality sampling. Basic principles used in controlling storm water were rapid removal of storm water from the area affected and storage for dispersal over a period greater than that of the storm at a rate close to the normal receiving stream flow. Studies indicated several effects of storm water on the Thames and its tributaries in the Greater London area. These include the depletion of dissolved oxygen in river water, where oxygen levels are dependent upon previous waterway conditions, flow quantity, and quality, and the spreading of pollution effects over a larger area when a storm occurs at rising tide. Possible control methods which were suggested included operating the sewerage system so as to contain as much of the dry weather flow within the system as possible; increasing intercepting sewer capacity to allow more storage and greater carrying capacity for storm water removal to treatment plants, storm tanks, or other areas; providing short term sedimentation or other treatment for pollution reduction; and aerating the river water to counter oxygen depletion. It was concluded that the major problem within the Greater London area was the control of storm water discharges. (Collins-FIRL)

CANWEL CAN DO,
H. H. Leich.
Compost Science, Vol. 17, No. 5, p 21, Winter, 1976.

Descriptors: *Waste water treatment, *Domestic wastes, *Water quality, *Treatment facilities, Water reuse, Environmental control, Sanitary engineering, Sewage treatment, Biological treatment, Chemical treatment, *Canada.
Identifiers: Ontario Research Foundation(Canada), Canwel sewerless sanitation system.

The Ontario Research Foundation has spent fifteen years developing the Canwel system of sewerless sanitation. The approach was developed under the assumption that central treatment plants cannot produce effluents which are nonhazardous to the environment and are not able to keep up with increasing demands upon them. Several avenues were investigated. Cleaning waste water to two levels, one good enough for recirculation to toilets, washing cars, and sprinkling lawns, and one pure enough for cooking and drinking, was the first step. Others were ozonation rather than chlorination for purification and incineration of sewage sludge and kitchen garbage. The heat produced was used for hot water needs. Advantages of this system would be the elimination of sewer lines and central treatment facilities, lessening of home water requirements, meeting of hot water demand without added energy input, lowered costs for refuse collection, and significant increases in the quality of effluents released to ground or surface waters. A combination of physical, biological, and chemical processes would be used to run the system. Filtration and reverse osmosis techniques would reduce contaminant levels and increase water quality. Brine concentrates from this process could be incinerated with sludge and garbage. A prototype installation has been successful and the next step will be testing of the entire system in an apartment building. (Collins-FIRL)
W77-06985

SEWERAGE FOR A RURAL RESORT AREA,
Alexandria Lake Area Sanitary District, Minn.
J. A. Sullivan.
Public Works, Vol. 108, No. 2, p 56-57, February, 1977. 1 fig.

Descriptors: *Sewerage, *Treatment facilities, *Interceptor sewers, Engineering structures, Tertiary treatment, *Waste water treatment, Construction, Costs, Financing, Planning, *Minnesota.
Identifiers: Alexandria Lake Area Sanitary District(Minn).

A tertiary waste water treatment plant, 75 miles of sanitary sewers and 48 major lift stations are being constructed to provide sewerage for a 50 square mile area in rural Minnesota. Fifteen lakes and the groundwater in the area began to show signs of pollution during the late 1960's. This project was instituted to preserve the water resources of the area. A secondary treatment plant was completed in 1971, phasing out the two plant system previously employed. A comprehensive program including an activated sludge process, followed by alum coagulation and polymer filtration, chlorination, and final aeration in ponds was accepted by government agencies responsible for pollution control. Total costs of the project including engineering, administration, land acquisition and capitalized interest is $23 million. Fourteen million dollars was obtained as grants from state and federal agencies. Operational costs are expected to be about $1.1 million annually. All properties gaining lateral sewer benefit from the system will be assessed by special levy. The treatment plant and interceptor system have a design capacity of 2.5 and 3.2 mgd, respectively. Staff is expected to total 14 full-time employees and 2 part-time employees by 1978. (Collins-FIRL)

THE USE OF OXYGEN TO TREAT SEWAGE IN A RISING MAIN,
Water Pollution Research Lab., Stevenage (England).
A. G. Boon, C. F. Skellett, S. Newcombe, J. G. Jones, and C. F. Forster.
Water Pollution Control, Vol. 76, No. 1, p 98-112, 1977. 6 fig, 11 tab, 9 ref.

Descriptors: *Oxygenation, *Sewers, *Anaerobic conditions, *Sulfur compounds, *Anaerobic bacteria, *Sulfides, Odor, Corrosion, Dissolved oxygen, Suspended solids, Biochemical oxygen demand, Physical properties, Chemical properties, Sludge treatment, Sewage treatment, Pumping plant, Treatment facilities, Filters, *Waste water treatment.
Identifiers: Oxygen injection, Rising main, Leucothrix, Bath(England).

Oxygen was used as a sewage treatment in rising and slow-flowing gravity mains to correct anaerobiosis which causes organic sulfur compounds and inorganic sulfates to be reduced to sulfide by specific bacteria growing in the sewage. Sulfide can lead to odor problems, concrete corrosion, and a sewage which is more difficult to treat at the receiving works. Testing was conducted in Bath, England. Average DO and total sulfide concentrations were 5 and 0 milligrams/liter, respectively, in the main and 0 and 8 milligrams/liter at the sewage works. Poor sludge settling characteristics at the facility were thought to be caused by Leucothrix bacteria in the raw sewage. By injecting oxygen and maintaining sewage DO concentrations above 0.5 milligrams/liter, sulfur formation was prevented. The oxygen was injected at a point on the outgoing main. The theoretical maximum of oxygen needed was 1400 kilograms/day. BOD reductions were equivalent to between 70%, in winter, and 140%, in summer, of the mass of DO injected at the foot of the main. BOD in the final treatment effluent decreased from 58 to 21 milligrams/liter; suspended solids decreased from 51 to 21 milligrams/liter. Although the total weight of the sludge produced at the plant was only slightly affected by this treatment, the consolidated sludge volume was reduced by nearly 10%. Treatment produced an almost total reduction of Leucothrix bacteria. During oxygen injection periods, there was an 8% increase in the daily power needed for sewage pumping because the flow rate decreased slightly. The annual cost of injecting oxygen to produce easily treatable sewage will be about 19,000 pounds. The alternative to this procedure, upgrading the biological filtration plant, would require an expenditure of 500,000 pounds. (Collins-FIRL)
W77-06996

ELECTRON-BEAM IRRADIATION OF WASTE PRODUCTS--E.G., FOR STERILIZATION OF SEWAGE SLUDGE AND WASTE INDUSTRIAL PRODUCTS.
French Patent FR 2298-363. Issued October 20, 1976. Derwent French Patents Abstracts, Vol. X, No. 48, p D3, January, 1977.

Descriptors: *Patents, *Equipment, *Sludge treatment, *Irradiation, Industrial wastes, Sewage treatment, Waste treatment, *Waste water treatment, Disinfection.
Identifiers: Sterilization.

A patent was issued for a sterilization process for wastes which can be stirred and mixed. The process involves irradiation of materials which flow into a chamber below an electron beam of 300-800 keV. Several parallel waste flow channels which are not transversely joined form the container. They have flat floors inclined to the horizontal and are connected by pumps and pipework. The radiation source covers the entire container and is perpendicular to the flow, producing a uniformly irradiated material. No excessive radiation is needed to treat thick layers. No protection and disposal problems are faced due to the lack of a strongly radioactive source. (Collins-FIRL)
W77-06997

SLUDGE SEPARATOR.
Australian Patent 478,919. Issued December 16, 1976. The Australian Official Journal of Patents, Trade Marks, and Designs, Vol. 46, No. 47, p 4621, December, 1976.

Descriptors: *Patents, *Separation techniques, *Sludge treatment, Equipment, Sewage effluents, Sediments, *Waste water treatment, Waste treatment, *Treatment facilities.
Identifiers: *Sludge separators.

A patent was issued for a sludge separator apparatus to remove sinking and buoyant contaminants from sewage. The apparatus is cylindrical with a vertical axis, and separated into an upper and lower chamber by an insert which also produces a gap between the two chambers. Sewage flows into the lower chamber below the water level and sinking contaminants in the sewage influent are deposited on the vessel bottom while buoyant contaminants are captured on the insert surface facing the bottom. (Collins-FIRL)
W77-06998

OXIDATION AND OZONATION CHAMBER,
BDH, Inc., Rome, Ga. (Assignee).
J. H. Bowen.
United States Patent 4,007,120. Issued February 8, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 2, p 582, February, 1977. 1 fig.

Descriptors: *Patents, Equipment, *Oxidation, *Ozone, Oxygen, Liquid wastes, Waste treatment, *Waste water treatment, Chemical treatment.
Identifiers: Electrostatic charge, *Ozonation.

A patent was issued for an oxidation and ozonation chamber to treat liquids. The combined treatment chamber is composed of several compartments. These compartments contain a rotatable axle with a blade which creates an electrostatic charge by liquid agitation and mixes oxygen and ozone with the liquids. (Collins-FIRL)
W77-06999

HYDROCARBON PRODUCTS MANUFACTURE--BY CARBONISATION OF COAL, SCRAP RUBBER OR PLASTIC OR DOMESTIC SEWAGE UNDER REDUCED PRESSURE.
French Patent FR 2300-124. Issued October 8, 1976. Derwent French Patents Abstracts, Vol. X, No. 50, p D5, January, 1977.

Descriptors: *Patents, *Organic compounds, Equipment, *Domestic wastes, Resources development, *Waste treatment, Sewage treatment, Coal, Carbon, Natural resources, Oxygen, Chemical reactions.
Identifiers: Hydrocarbon products.

A patent was issued for a process to make hydrocarbon products from organic raw materials with coal or an analogous carboniferous material. The process can be applied to domestic sewage. The operation involves circulating the material through an elongated tubular element at a temperature of 425-98 C in the absence of oxygen at a reduced pressure of 50-150 mm Hg. The raw material is agitated as it enters the tube to increase surface area contacting the inner surface of the element. Reduced pressure in the process assures the removal of liquid and gaseous hydrocarbons before secondary reactions occur. (Collins-FIRL)

SEWAGE AERATION IMPELLER-WITH AUTOMATIC DE-ICING AND ANTI-CLOGGING SYSTEM,
K. Tofaute.
Soviet Patent SU-504-472. Issued April 30, 1976. Soviet Inventions Illustrated, Vol. X, No. 51, p D5, February, 1977. 1 fig.

Descriptors: *Patents, *Aeration, Equipment, *Sewage treatment, Biological treatment, Cleaning, *Waste water treatment, Oxygen, Waste treatment, Sewage effluent.

A patent was issued for a sewage water surface aerator employed in biological cleaning. Contamination of external surfaces is prevented by connecting tubes to these surfaces and the volume of the transport channels. The mechanism consists of a conical body with corrugated internal walls and external caps connecting the outer surface with the transporting channel volume. It is fixed to a drive shaft and, when rotated, the liquor is sucked into the transporting channel, mixed with air, and ejected by centrifugal forces. Oxygen from the air further aerates the dispersed liquor. (Collins-FIRL)
W77-07001

METHOD OF WASTE TREATMENT AND ALGAE RECOVERY,
California Univ., Berkeley. (Assignee).
W. J. Oswald.
United States Patent 4,005, 546. Issued February 1, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 1, p 30, February, 1977. 1 fig.

Descriptors: *Patents, *Algae, *Sewage treatment, *Ponds, *Aerobic treatment, Air, Water purification, *Waste water treatment, Sewage effluent, Treatment facilities, Waste treatment.
Identifiers: *Algae recovery.

A patent was issued for a method of waste treatment and algae recovery involving three ponds. Sewage containing algae is retained in a pond open to light and air under natural conditions for 10 to 20 days. A portion is transferred to another pond open to light and air which is agitated for 3 to 6 days. Then a portion of the water in the second pond is transferred to a third that is substantially closed to light and remains quiescent for 1 1/2 to 3 days while algae settles. Settled algae is removed from this last pond. (Collins-FIRL)
W77-07003

RENOVATION OF WASTE WATER,
Ontario Research Foundation, Sheridan Park. (Assignee).
F. Besik.
United States Patent 4,008,159. Issued February 15, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 3, February, 1977. 1 fig.

Descriptors: *Patents, *Water purification, Suspended solids, Organic matter, Inorganic compounds, Nitrogen compounds, Odor, Adsorption, Biological treatment, Chemical treatment, Filtration, Coagulation, Microorganisms, Phosphates, *Waste water treatment.
Identifiers: Waste water renovation.

A patent was issued for a process to renovate waste water containing contaminates such as suspended solids, dissolved organic material, organic nitrogen-, ammoniacal nitrogen-, nitrite nitrogen-, and nitrate nitrogen-containing materials, phosphate material, odor-producing matter, and turbidity-producing material. The process subjects waste water to primary treatment for partial removal of dissolved organic matter, nitrogenous and phosphate matter, and turbidity-causing matter, followed by effluent removal to a second treatment zone where adsorption-biological treatment using activated carbon and microorganisms takes place. The effluent from this stage is treated with chemical coagulants, and then treated with ozone and oxygen. After the filtration of solids, renovated water is removed. (Collins-FIRL)
W77-07004

WASTE TREATMENT APPARATUS,
Ecolotrol, Inc., Bethpage, N.Y. (Assignee).
J. S. Jeris.
United States Patent 4,009,105. Issued February 22, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 4, p 1264, February, 1977. 1 fig.

Descriptors: *Patents, Equipment, *Biochemical oxygen demand, *Biological treatment, *Oxidation, Microorganisms, Filters, Oxygen, Carbon dioxide, *Waste water treatment, Organic matter.

A patent was issued for a treatment apparatus to biologically remove BOD from waste water. The equipment is composed of an elongated vertical container with a manifold near the bottom for control of waste water passage through the container, and an inlet for waste water that will be treated. Above the manifold is a fluidized bed of a solid particulate carrier with a layer of cultured microorganisms for BOD oxidation. There are means for adding oxygen to the bed which is arranged to receive the waste water and biologically convert most of the BOD to be removed to carbon dioxide, water, and cellular material. The waste water and carbon dioxide are continuously removed through an outlet, and the excess cellular material is removed from the particulate carrier. (Collins-FIRL)
W77-07005

PROCESS FOR THE TREATMENT OF WASTE WATER BY HETEROGENEOUS PHOTOSENSITIZED OXIDATION,
Temple Univ., Philadelphia, Pa. (Assignee).
J. R. Williams.
United States Patent 4,008,136. Issued February 15, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 3, p 929, February, 1977.

Descriptors: *Patents, *Light, *Oxidation, *Polymers, *Liquid wastes, Sewage effluents, Oxygen, Water purification, *Waste water treatment, Treatment.
Identifiers: *Photolysis.

A patent was issued for the treatment of waste water by heterogeneous photosensitized oxidation. This process is especially for waste water containing organic materials. A water insoluble polymer-based photosensitizer is added to the waste effluent in the presence of oxygen. The suspension is photolyzed by light with a wavelength between 320 and 800 nm. (Collins-FIRL)

LIBRARY U. OF I. URBANA-CHAMPAIGN

METHOD OF APPLYING OZONE AND SONIC ENERGY TO STERILIZE AND OXIDIZE WASTE WATER,
TII Corp., Lindenhurst, N.Y. (Assignee).
A. D. Henderson, and J. M. Periale.
United States Patent 4,003,832. Issued January 18, 1977. Official Gazette of the United States Patent Office, Vol. 954, No. 3, p 1203, January, 1977. 1 fig.

Descriptors: *Patents, *Ozone, *Sound waves, *Cavitation, *Oxidation, Water purification, Suspended solids, Coagulation, Polyelectrolytes, *Waste water treatment, *Sterilants.

A patent was issued for a method employing ozone and sonic energy to sterilize and oxidize waste water. A coagulating agent is added, followed by a polyelectrolyte to form a floc. The water is passed through a lamina to remove suspended solids, and is then passed in a counter-flow through a gravity gradient stand of water. The water is pre-treated with ozone and sonic energy to cause cavitation. Further treatment by ozone and sonic energy produces additional cavitation for effective oxidation and sterilization. (Collins-FIRL)
W77-07007

APPARATUS AND PROCESS FOR REMOVING AMMONIA NITROGEN FROM WASTE WATER,
Ecolotrol, Inc., Bethpage, N.Y. (Assignee).
J. S. Jeris.
United States Patent 4,009,099. Issued February 22, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 4, p 1262, February, 1977. 1 fig.

Descriptors: *Patents, Equipment, Water purification, Biological treatment, Oxygen, Ammonia, *Nitrogen, *Ammonia compounds, Microorganisms, Temperature, Oxidation, *Waste water treatment, Aerobic conditions.
Identifiers: Fluidized bed, Ammonia nitrogen.

A patent was issued for an apparatus and biological process to remove ammonia nitrogen from waste water. The process includes a fluidized bed of a solid particulate carrier with a cultured layer of nitrifying microorganisms. Waste water continuously passes through this bed, to which oxygen is added, and retained at a controlled temperature and length of time under aerobic conditions. This biologically converts most of the ammonia nitrogen to be removed from the waste water to oxidized forms of nitrogen, water and cellular material. These oxidized nitrogen forms and the water are continuously removed from the bed, as the excess cellular material is removed from the particulate carrier. (Collins-FIRL)

EXPANSION COMES QUICKLY TO AWT PLANT,
Connell/Metcalf and Eddy, Coral Gables, Fla.
G. M. Lockward.
Water and Wastes Engineering, Vol. 14, No. 1, p 26-27, January, 1977. 1 tab.

Descriptors: *Treatment facilities, *Waste treatment, *Tertiary treatment, *Activated sludge, Equipment, *Waste disposal, *Waste water treatment, Design, Underground waste disposal, Automatic controls, *Florida.
Identifiers: *Miami-Dade(Florida) Water and Sewer Authority.

The Miami-Dade (Florida) Water and Sewer Authority has expanded a waste water treatment facility so that it can handle a 200% increase from 2.0 mgd to 6.0 mgd of influent. The additions were: new contact stabilization activated sludge units with minor modifications, rapid sand filtration units, expanded phosphorus removal equipment, expanded chlorination treatment with automatic dosing, new flow measuring devices, conversion from outfall disposal to subsurface disposal, expanded sludge drying beds, added air blowers, added standby power capacity, expansion of the laboratory, and new office space. The activated sludge units can be easily altered to a conventional process involving aeration, but would require additional digestion tanks. This would also allow single-stage nitrification. When this change is effected, sodium aluminate will be used for phosphorus removal instead of alum. Though operating at 65% of capacity, the plant has proven successful in its effluent treatment. (Collins-FIRL)

THE PLIGHT AND PROMISE OF ON-SITE WASTE WATER TREATMENT,
Interstate Electronics Corp., Arlington, Va.
A. Hershaft.
Compost Science, Vol. 17, No. 5, p 6-12, Winter, 1976. 3 fig, 2 tab, 36 ref, 2 append.

Descriptors: *Waste water treatment, *Sewerage, *Municipal wastes, *Domestic wastes, *Septic tanks, *Cesspools, Treatment facilities, Pollution abatement, Water pollution sources, Planning, Costs, Treatment, Water conservation.
Identifiers: *On-site waste water treatment.

The problems faced in the development of on-site domestic sewage treatment stem from the assumption that such treatment is primitive and unenlightened. However, it is being proposed as a viable alternative to centralized treatment systems. Prototype sewer systems were used as early as 3750 B.C. in an Indian culture. New York City, in 1805, built the first American sewer system and added a treatment plant in 1870. The present American system is basically the same as the Roman design with the addition of treatment facilities. Several drawbacks seen in the system of centralized sewerage are pollution of ground and surface waters, dispersal of toxic substances, groundwater depletion, induced development of communities, and high construction costs. These involve eutrophication and drawing water from aquifers to surface waterways. In 1973, the total cost for building municipal treatment and collection facilities which were eligible for Federal Funding was $60 billion. On-site treatment usually involves some type of water conservation and effluent discharge into soil. Two types of on-site treatment are cesspools, and septic tanks. Studies are being made of the applicability of aerospace and advanced technologies to the improvement of on-site treatment. (Collins-FIRL)
W77-07010

TREATMENT OF SEWAGE BY ELECTRONS AND GAMMAS,
Physics Today, Vol. 29, No. 12, p 20, December, 1976.

Descriptors: *Waste water treatment, *Sewage treatment, *Irradiation, *Ionization, Electronic equipment, Sludge treatment, Disinfection, Heat treatment, Toxicity, Viruses, Bacteria, Chemical wastes, Costs.
Identifiers: *Electron treatment, *Gamma ray treatment.

High energy electron and gamma ray treatment of sewage sludge for use as fertilizer was studied. MIT designed a facility to treat 100,000 gpd. A sludge slurry (2-5% solids) flows through an electron beam from a high-voltage accelerator which disinfects and destroys bacteria. Ionization may possibly break up toxic chemical pollutants such as PCB's and pesticides. Advantages of this system are the availability and controlability of the ionizing energy and the lack of radioactivity introduction into the treated matter. Economic analysis suggests the system may be practical. Sludge with 5% solids could be treated for approximately $16/dry ton of sludge processed. Capital costs would be about $500,000 and operational costs would be about $120,000. A 400,000 rad exposure eliminates coliforms and salmonella and reduces bacteria and viral counts. Sandia Laboratories, Albuquerque, New Mexico, investigated gamma ray sewage treatment. The system uses heat and radiation to produce liquid sludges suitable for soil conditioning and restoring depleted soils. Studies indicated possible restoration of treated wastes to the food chain as animal feed. A major advantage is the high penetrating capability of gamma rays. Economic feasibility has been projected for this system. Other experiments attempted to remove the curing process to allow treatment of larger waste volumes. Costs are estimated as $3-5 per ton. (Collins-FIRL)

NEW VISIBILITY FOR ON-SITE WASTE TREATMENT SYSTEMS,
S. Smyser.
Compost Science, Vol. 17, No. 5, p 12-14, Winter, 1976. 2 tab.

Descriptors: *Waste treatment, *Sewerage, *Treatment facilities, Sewage treatment, Domestic wastes, Industrial wastes, *Waste water treatment, Planning, Costs, Sewage disposal, Project planning, Projects, Economics.
Identifiers: *On-site waste water treatment.

A review was presented of EPA involvement in on-site waste treatment development and demonstration projects. This is an emphasized area because the economic and environmental costs of sewerage has greatly increased. Past EPA performance in this respect has been criticized as being inadequate and slow. Prohibitive costs make alternative developments a great need in many communities. It was revealed that the most detailed comparative cost information was from industry sources. One study indicated that individual composting toilets could produce a 79% saving over central sewerage in two small Massachusetts towns. Another study in Sterling, Connecticut, showed that the use of on-site composting units would eliminate annual operating costs, reduce water consumption by 40%, cut garbage disposal and chlorine costs, and make a zero discharge situation possible. The lack of reliable information on composting systems is the major hindrance. Other studies and investigations reviewed were water recycling for garden fertilizing and the several far sighted efforts in Maine, New Hampshire, and Oregon relative to environmental planning: separated waste water systems, water use reduction schemes, and evaluation of self-contained sewage treatment systems. (Collins-FIRL)

UNOX SYSTEM FOR WASTE WATER TREATMENT,
Union Carbide Corp., Tonawanda, N.Y. Linde Div.
D. E. Braunscheidel, and R. G. Gyger.
Chemical Engineering Progress, Vol. 72, No. 11, 71-72, November, 1976. 1 fig.

Descriptors: *Waste water treatment, *Nitrification, *Bacteria, *Growth rates, *Toxins, *Ammonia, Temperature, Hydrogen ion concentrations, Dissolved oxygen, Biomass, Biochemical oxygen demand, Sludge treatment, Model studies, Economics.
Identifiers: UNOX, Monod model.

Various aspects of nitrification in waste water treatment were investigated. The Monod model was used as a convenient means of describing ammonia substrate removal and bacterial growth of nitrifying organisms. Specific cell growth rate is proportional to substrate concentration until a maximum is reached and it becomes independent of this factor. Nitrifying bacteria growth rates are determined by evaluating effects of temperature, pH, and dissolved oxygen levels. Mass balance for ammonia and bacteria are determined relati

to the activated sludge system. A relationship is formed between system sludge residence time (SRT) and the above parameters. A pH between 7.0 and 8.0 has been found preferable for nitrifying bacteria. Toxins and inhibitory substances suppress or inhibit bacteria growth. Experiments supported data predictions of the model. Single and two-step systems were described. The first system performs carbonaceous removal and nitrification in the same reactor at low organic loadings and long retention times. With low loadings, solids production per unit BOD5 is low and oxygen use per BOD5 unit is higher than in conventional carbonaceous systems. The two-step systems separate the two processes and carbonaceous removal is not as efficient as in the one step system. However, high food to biomass ratios allow low SRT's and small tank volumes. Influent is fed to the second step, low in BOD, allowing low food/biomass ratios and short SRT's. Total oxygenation tank volume of the two-step method is less or equal to that of the one step system. Oxygen consumption is higher and sludge production is lower in the one step process. Economics and waste water characteristics should determine the system used. (Collins-FIRL)

DESIGN AND CONTROL OF SECONDARY SETTLEMENT TANKS,
Water Pollution Research Lab., Stevenage (England).
M. J. D. White.
Water Pollution Control, Vol. 75, No. 4, p 459-467, 1976. 8 fig, 2 tab, 17 ref.

Descriptors: *Settling basins, *Sedimentation, *Design criteria, *Suspended solids, Sludge treatment, Nitrification, Denitrification, Flow, Equipment, *Waste water treatment, *Control.
Identifiers: Stirred specific volume, Stirred sludge density, Solids loading, Filamentous organisms.

The determination of settled volume at one solids concentration was studied as a parameter of the design and control of secondary settlement tanks. Solids loadings (mass flux) has two components - that of floc settling under gravity and that of sludge withdrawal from the tank bottom. Plotting the solids loading curve against that for solids concentration reveals the maximum solids loading. A method was given to make these determinations by assaying settled volume of mixed liquor in a stirred cylinder and dividing by the solids concentration to give the stirred specific volume (SSV) in milliliters/gram. The reciprocal of the resultant figure multiplied by 100, converting the units to percent, reveals the stirred sludge density (SSD). This experimental data measured the settling characteristics which were used to predict maximum solids loadings. Calculations made at a suspended solids concentration of 3.5 grams/liter were found adequate for these determinations. Results indicated that a low sludge return rate was best for design purposes. The concern was to decide on a SSV value. Design-related SSV predictions showed that SSV may be 80-140 milliliters/gram for partial-treatment plants with a sludge age less than 1.5 days with no nitrification; SSV of 100 milliliters/gram is good for plants with fully nitrified effluents and sludge age greater than 5 days; and SSV of 120-160 milligrams/gram is sufficient for plants with sludge age between 1.5 and 5 days. For settlement tank control, SSV calculations ensure a better determination of maximum solids loading. Maximum MLSS concentrations at a given flow rate or the maximum flow rate for a given MLSS can be calculated. In nitrifying plants, denitrification in the final tank and filamentous organism growth can be prevented by employing an anoxic zone. (Collins-FIRL)
W77-07015

FAST-TRACKING CUTS COSTS 16% ON ADVANCED WASTE WATER PLANT.
Engineering News-Record, Vol. 197, No. 26, p 47-48, December, 1976.

Descriptors: *Treatment facilities, *Construction, *Construction costs, *Sewage treatment, Sludge treatment, *Waste water treatment, *Tertiary treatment, Economics, Equipment.
Identifiers: Fast-tracking, Hillsboro(OR).

The construction of a 15 mgd advanced waste water treatment plant near Hillsboro, Oregon, involved the first application of fast-tracking in treatment plant building practices. This method resulted in a $3.8 million saving and a completion date nine months earlier than with conventional methods. Savings were also realized by bidding the project in small packages, eliminating general contractor markup of subcontractor bids, and eliminating equipment markup. Forty-one of forty-eight contracts have been awarded and the project is 54% complete. Construction packages included excavation, raw sewage pump station, and construction of primary treatment facilities. Some consideration should be given to the fact that project approval time-lag might negate any time savings from fast-tracking. One advantage is that the owner will probably know more about the facility after construction, which may aid more effective operation. The plan involved a 10-year plan to replace six smaller and less efficient plants which will be dismantled. Salvageable equipment will be sold. The plant will be able to handle a 45 mgd peak flow. Primary treatment facilities include a raw sewage pump station, comminution basin, grit basin, four 100-foot diameter primary clarifiers and a primary sludge pump station. There is a pure oxygen activated sludge system and waste water will be treated with alum and polymers to remove phosphorus and remaining settleable organic matter. Advanced treatment sections will only be used during summer, and waste sludge will be used as fertilizer. Methane gas from sludge digesters will be used by the plant. (Collins-FIRL)

WASTE WATER SYSTEM USES MICROWAVES,
Chemical Engineering, Vol. 84, No. 3, p 77-78, January, 1977. 1 fig.

Descriptors: *Waste water treatment, *Microwaves, Water purification, Solid wastes, Liquid wastes, Treatment facilities, Coagulation, Filters, Polyelectrolytes, Disinfection, Ozone, Sewage effluents, Dewatering, Fertilizers, Landfills.
Identifiers: Watertek.

Sterilized, dry solids which are ready for disposal are produced by the six-step Watertek waste water treatment system that employs a microwave oven. The process produces liquid discharges which are clear, odor-free, and meet EPA 1983 waste water effluent standards. Settling ponds, digesters, and sludge beds are eliminated by this process. A more compact design is possible because liquid and solid wastes can be fully treated in 60 minutes. A 250,000 gpd system uses a space of about 30 x 40 feet, with a height of about 15 feet. Each step of the process forms a module of the system. In the first step solids are passed through a micro-screen filter and then to the oven, while liquid passes to a pressure vessel for the addition of air. A cationic polyelectrolyte polymer is added to the liquid and the mixture moves to an air float chamber where micro-bubbles form. The polymer acts as a coagulant for solids which collect in the bubbles. A rotating skimmer collects the bubbles and they are fed to a vacuum filter and/or centrifuge and, then, to the oven. Water moves to an ozone disinfection cell for sterilization and is passed out of the carbon filter as a clear and contaminant-free solution. Solids are dewatered before entering the microwave oven and, depending on feed composition, can be used for fertilizer or landfill. (Collins-FIRL)

WASTE WATER TREATMENT PLANT BUILT IN WET HOLE,
G. Svenson.
Western Construction, Vol. 52, No. 1, p 32, 34, January, 1977.

Descriptors: *Treatment facilities, *Construction, *Construction costs, *Construction equipment, *Construction materials, Excavation, Concrete, Steel, Cranes, Fabrication, Tertiary treatment.

A $16,630,000 tertiary waste water treatment plant is being constructed in an excavation. The completed facility will be entirely underground. Various stages of construction are carried on at the same time. Several interesting construction techniques are employed. Pre-fabrication of steel piping, a point-of-need warehouse system, and a 70-ton crane, capable of reaching all parts of the structures, contribute to cost savings. Vertical trenching was specified for all underground piping and, because the site is below groundwater levels, it is constantly dewatered. Steel piping was coated, lined and prefabricated at one plant, allowing piping delivery before schedule. Most concrete is to be below water levels and wells were scattered about the site to allow building below grade. Specifics of construction and transport methods were presented. (Collins-FIRL)

THE OPERATIONS SECTION OF LINCOLN SEWAGE DIVISION,
K. G. Pullen.
Surveyor, Vol. 148, No. 4411/4412, p 11-12, December, 1976.

Descriptors: *Water districts, *Operation and maintenance, *Personnel, *Budgeting, Mechanical equipment, Power operation and maintenance, Engineering personnel, Scientific personnel, Maintenance, Sludge treatment, Sludge disposal, Sewers, *Treatment facilities.
Identifiers: *Anglian Water Authority(England).

The personnel and management structure of the Operations Section of the Anglian Water Authority, England, was described. The headquarters staff consists of the operational services officer and the scientific officer and three area managers. The services officer is responsible for such activities as transport, communications, electrical and mechanical maintenance, and health and safety. The science officer advises on works performance and assists on process design. The lower personnel structure is described, as is the policy decision-making process. Maintenance staffs and their respective duties are outlined relative to sludge treatment and disposal, electrical and mechanical engineering, and sewerage. (Collins-FIRL)
W77-07023

ENERGY CONSERVATION AND HEAT RECOVERY IN WASTE WATER TREATMENT PLANTS,
Pirnie (Malcolm), Inc., White Plains, N. Y.
F. S. Pallio.

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

Water and Sewage Works, Vol. 124, No. 2, p 62-65, February, 1977. 4 fig, 7 tab.

Descriptors: *Energy, *Conservation, *Heat, *Heat pumps, Heating, Resource development, Refrigeration, Temperature, Performance, Costs, Equipment, Waste water treatment, Sludge treatment, *Treatment facilities.
Identifiers: Energy wheel.

Heat recovery has been considered as a useful approach to energy conservation in waste water treatment. Heat pumps, heat exchangers, and the energy wheel have been evaluated. Using processed waste water or other warm water sources for the heat pump provides a higher temperature source than that of ambient air. The Coefficient of Performance (COP) defines heat pump efficiency and is the ratio of useful heating output to the power input. The use of warm waste water results in a higher COP than air or water. Using heat pumps would allow recovery of available energy from waste water; provide 3 to 5 times more Btu/hr/kw than direct electric resistance heating units; have an economic advantage above oil-fired heating systems; and conserve energy resources. The energy wheel is a rotary air-to-air heat exchanger consisting of a revolving cylinder packed with coarse knit metal mesh. The cylinder rotates through an exhaust air stream, picks up heat, is purged of contaminated air, and finally, rotates through the outside air stream giving off the collected heat. Incoming cold air can be pretreated by using heat from the contaminated exhaust air stream. Other advantages are the reduction of cross contamination to less than 1%, and the availability of materials that allow moisture transfer from the exhaust to the incoming air stream, aiding recovery of sensible and latent heat from air-conditioned spaces. The use of the energy wheel can reduce the size of heating equipment, as well as the fuel and energy consumption. Both concepts can reduce annual heating costs. (Collins-FIRL)
W77-07024

MUNICIPAL WASTE WATER TREATMENT AS AN INDUSTRIAL OPERATION,
Environmental Quality Systems, Inc., Rockville, Md.
D. L. Guthrie.
Water and Sewage Works, Vol. 124, No. 2, p 60-61, February, 1977. 1 fig, 2 tab, 16 ref.

Descriptors: *Treatment facilities, *Operation and maintenance, *Municipal wastes, *Industrial wastes, *Costs, Legislation, Tertiary treatment, Pollution abatement, *Waste water treatment, Capital costs, Construction costs, Comparative costs.
Identifiers: Federal Water Pollution Control Act Amendments, 1972(PL 92-500).

More advanced treatment processes, upgraded facilities, and better operation and maintenance procedures will be needed to comply with the treatment goals of PL 92-500. The costs involved require that facilities be operated as efficiently as possible to offset increased construction and operation costs. The capital investment in a municipal waste water treatment facility may reach $10 million. The suggestion that municipal treatment facilities be operated on a basis similar to that of industrial plants was reviewed. These are operated for the most cost-effective and satisfactory results and can involve higher capital costs than municipal treatment plants. A comparison was suggested with a sulfuric acid plant. Variables involved in such a comparison were initial investment, amortization, plant age, number of employees, volume of production, dollar price of the end product, and raw material cost. For municipal waste water facilities, production volume is the combined volume of sludge and effluent and the dollar price of the end product is the cost to the taxpayer. It was concluded that water quality laws will not be successful unless municipal waste water treatment is considered a profit-making operation rather than a burden. The final product is 'clean water' for the consumer. (Collins-FIRL)
W77-07025

PLUG-IN CONCEPT FOR PILOT SEWAGE TREATMENT PLANT,
J. Pullin.
Water and Sewage Works, Vol. 124, No. 2, p 52-53, February, 1977.

Descriptors: *Oxygenation, *Pilot plants, *Treatment facilities, *Tertiary treatment, *Biological treatment, *Chemical treatment, Construction, Design, Domestic wastes, Industrial wastes, Equipment, Personnel, *Waste water treatment.
Identifiers: Coleshill(England), NATO Committee on the Challenges of Modern Society(CCMS).

Waste water treatment by use of oxygenation is being studied at the advanced waste water treatment facility at Coleshill, England. The project is a pilot project for the NATO Committee on the Challenges of Modern Society (CCMS). The oxygenation is combined with conventional biological processes. The Coleshill facility has two treatment streams with a dry weather flow of 100,000 gallons/day. Treatment of both industrial and domestic flows and combination flows are being tested. Fixed facilities include a service gantry, inlet works, reagent preparation plant, sludge dewatering plant, laboratory and workshop, and a substation and office buildings. Mobile treatment units may be added at either side of the gantry to allow maximum flexibility at the works. These allow the combining of laboratory functional flexibility and full scale operation. Mobile units provide chemical flashmixing tanks; chemical flocculation tanks; settling tanks; recarbonation tanks; surface aeration tanks; biological filters; screw pumping units; multimedia filters; and granular activated carbon columns. Fixed facilities provide lime, ferric sulfate alum, polyelectrolyte, acid and carbon dioxide dosing; pilot scale multimedia filters; granular activated-carbon columns; storage tanks for biological and chemical sludges; and a sludge treatment house. Results have produced 99% phosphorus removal, 90% suspended solids reduction, 70% BOD removal and 65% COD reductions with the addition of 400 milligrams/liter of lime slurry. Portable sensors monitor all plant performance. (Collins-FIRL)
W77-07026

FAIL-SAFE WASTE TREATMENT SYSTEM,
CH2M/Hill, Reston, Va.
G. A. Gunn.
Water and Sewage Works, Vol. 124, No. 2, p 12, February, 1977.

Descriptors: *Treatment facilities, *Planning, *Waste water treatment, *Tertiary treatment, Chemical treatment, Environmental control, Water quality, Reservoirs, Natural resources, Construction, Automatic controls, Sewerage, Virginia.
Identifiers: Occuquan Sewage Authority(Va).

In order to prevent pollution of its water supply by sewage effluents, the Occuquan Sewage Authority, Virginia, has begun construction of an advanced waste water treatment system. This system will eliminate eleven treatment plants and will have many redundancy features to ensure operation under most foreseeable conditions. Funding of the project was aided by the EPA, the state of Virginia, and local government. A regional treatment facility will handle the loads now treated by the eleven facilities, and will employ a 15 mgd capacity, five raw sewage pump stations, and 150,000 lineal feet of interceptor sewers and force mains. Treatment will consist of primary and secondary treatment, chemical treatment for phosphorus removal, ion exchange for ammonia nitrogen removal, carbon absorption and multimedia filtration for residual organics removal, and chlorination for disinfection and residual ammonia removal. Effluent quality should have a BOD of less than 1 mg/liter, zero suspended solids, a COD of less than 10 mg/liter, less than 2 coliform bacteria per 100 milliliters, and less than 0.1 mg/liter of phosphorus. The duplication of facilities includes two alternate off-site power sources and an on-site standby power generation system; an automatic by-pass of incoming raw sewage to an emergency retention basin during total power failure; and piping and valves designed to accommodate any failure. (Collins-FIRL)
W77-07027

PLASTIC SPHERES FOR WASTE WATER TREATMENT.
Water Services, Vol. 80, No. 970, p 737-738, December, 1976.

Descriptors: *Plastics, *Waste water treatment, *Industrial wastes, Biochemical oxygen demand, Equipment, Filters, Organic matter, Sewage effluent, Waste water treatment, Sewage treatment.

Mechanicl purification systems have been developed using modifications of the activated sludge process which are more easily adapted to variations and shock loads. The Euro-Matic Bio-Drum was developed to combine the advantages of mechanical and natural purification processes. A pair of open mesh drums, filled with hollow plastic spheres which revolve around a shaft suspended by a 'swinging arm' attached to the side of the treatment tank are the basic mechanisms. This combines the trickling filter and activated sludge processes. The plastic balls are alternately dipped in liquor to take in organic matter, and exposed to the atmosphere, to absorb oxygen and generate biological activity. Results with hydraulic loads of 6 to 25 cu m/cu m/day and BODs from 1.2 to 4.7 kg/cu m/day showed reductions of 90% at lower loadings and 40% at higher loadings. With activated settled sludge returned to thicken the mixture in the tank, at 25 cu m/cu m/day and BOD of 5.5 kg cu m/day, a 90% BOD reduction was evidenced. Operation costs of a unit with a small single motor drive are minimal as is the installation cost. (Collins-FIRL)

SCREENINGS DEWATERING PRESS.
Water Services, Vol. 80, No. 970, p 737, December, 1976.

Descriptors: *Dewatering, *Screens, *Sludge treatment, Equipment, Treatment facilities, Incineration, Solid wastes, Waste treatment, *Waste water treatment.
Identifiers: *Dewatering press.

The Temact screenings dewatering press was developed to be used with sewage screens. It is made of a hydraulically operated press with a power and hydraulic control unit and an electrical control panel. Only interconnecting wiring, washing-down, and drainage facilities are necessary. Compression separates rags, paper, and like solids from liquid and fine matter which are subject to usual treatment processes. About two-thirds of the water is removed from screenings and weight and volume are reduced 55 to 60%. Discharged dewatered screenings are compact, relatively dry, and can be automatically bagged, if desired. They have a caloric value amenable to economical incineration. (Collins-FIRL)

SLUDGE DEWATERING ON ALASKA'S NORTH SLOPE.
Industrial Wastes, Vol 23, No 1, p 19, January/February, 1977.

Descriptors: *Dewatering, *Centrifugation, Separation techniques, Sludge treatment, Sewage

treatment, Flocculation, Polyelectrolytes, Biochemical oxygen demand, Disposal, Incineration, *Alaska, Arctic, Biological treatment, *Waste water treatment.
Identifiers: *North Slope(Alas).

Modern treatment methods that meet EPA regulations are being used in Alaska to replace traditional sewage disposal which usually involved ocean dumping. Techniques used on the North Slope are described. Two oil companies, Atlantic Richfield and BP Alaska, use a biological aerated sludge treatment system and a combined biological and physical-chemical system, respectively. Both, however, use continuous decanter centrifuges for sludge dewatering. Dewatering reduces the volume of sludge and improves its handling characteristics prior to disposal. Less consumption of water in the arctic lifestyle produces sewage with a high BOD or solids level. The ARCO base camp treatment system produces 450-500 pounds of cake concentrate and 5,000 gallons of clarified water per day from a waste water flow of 6 gpm containing 1-3% solids. The clarified water is recirculated to the sewage plant primary stage. Flocculation is induced in the sludge by the addition of polyelectrolytes just prior to centrifugation. This increases the rate of solids separation. The BP process handles feeds of 1-3% solids at 6 to 8 gpm, and 1% solids at 3 to 6 gpm. After dewatering, the cake concentration has 15-20% solids. The BP process reduces fuel costs for incineration, provides for continuous unmanned operation and an overload device to prevent serious breakdowns, and uses a closed system installation having operational flexibility. The De Laval decanter/centrifuges consist of a cylindrical bowl inside of which is a screw conveyor, both rotating in the same direction, though the conveyor moves at a different speed to transport separated solids to the solids discharge area. Solids and clarified water are simultaneously discharged. (Collins-FIRL)

SINGLE P/C UNIT REMOVAL OF NUTRIENTS FROM COMBINED SEWER OVERFLOWS,
O'Brien and Gere Engineers, Inc., Syracuse, N.Y.
C. B. Murphy, Jr., O. Hrycyk, W. T. Gleason, R. Field, and E. Fan.
Journal Water Pollution Control Federation, Vol 49, No 2, p 245-255, February, 1977. 8 fig, 2 tab, 7 ref.

Descriptors: *Overflow, *Combined sewers, *Nutrients, Separation techniques, Treatment facilities. Phosphorus, Ammonia, *Waste water treatment, Polymers, Design criteria, Aluminum, Lakes, Reservoirs, Surface waters, Tributaries.
Identifiers: Alum, Clinoptilolite.

An investigation, beginning with a pilot scale program and concluding with demonstration-scale facilities, was conducted to determine design criteria for the construction of a system to remove nutrients from combined sewer overflows. The unit developed was a high rate combined process using primary screening, in-line alum addition and coagulation, and contact with clinoptilolite. Alum dosages which produce an aluminum: phosphorus molar ratio of 1.2 to 1.8 removed 90-95% of the phosphorus. Phosphorus removal was not enhanced by excessive alum treatment. Polymer doses for removing solids depended upon the level of solids in the overflow waste water and on the solids generated by the alum. This system could be used to partially treat lake and reservoir tributaries with an algae problem during dry weather conditions, and to treat receiving streams immediately following a storm. Ammonia removal depended upon the NH3N concentration in the influent, the volume of clinoptilolite used, and the waste water application rates. Ammonia removals of 0.36 meq/gram (5.0 milligrams NH3N/gram of clinoptilolite) were achieved. Three contractors in a series are necessary to optimize the use of clinoptilolite. This system is ideal for conditions where treatment of a point source combined sewer overflow discharge is necessary, where space limitations do not allow conventional treatment, and where conveying waste water is impractical. (Collins-FIRL)

INFLUENCE OF PHOSPHORUS REMOVAL ON SOLIDS BUDGET,
Michigan Technological Univ., Houghton. Dept. of Civil Engineering.
C. R. Baillod, G. M. Cressey, and R. T. Beaupre.
Journal Water Pollution Control Federation, Vol 49, No 1, p 131-145, January, 1977. 4 fig, 13 tab, 16 ref.

Descriptors: *Phosphorus, *Activated sludge, *Aerobic digestion, Chemical treatment, Biological treatment, Suspended solids, Sludge treatment, Dewatering, Physical properties, Chemical properties, *Waste water treatment, Economics.
Identifiers: Alum, Phosphorus removal.

A study was conducted to determine the influence of phosphorus removal on the solids budget of an activated sludge plant equipped with aerobic digestion. Specific objectives were the determination of the quantity, solids content, digestibility, and dewatering properties of the excess sludge produced, and the determination of the effect of alum addition on solids transformations within the activated sludge and aerobic digestion processes. An 81% total phosphorus removal was achieved with liquid alum doses of 1.7 moles of aluminum/mole of influent phosphorus. The same system without any chemical addition produced a 27% phosphorus removal. Chemical-biological activated sludge processes gave 50% more excess sludge on a dry weight basis and 16% more excess sludge on a volumetric basis. There was a marked net conversion or solubilization of the solids and phosphorus components to a dissolved form. In the control this was greater than in the alum unit. Volatile and fixed dissolved solids in both units showed net productions, and total solids, total fixed solids and phosphorus seemed to be conserved in each. Similar material balances for aerobic digesters showed the alum-biological sludge to be less amenable to aerobic digestion, but the alum sludge thickened much better than the control sludge. Alum-biological sludge total suspended solids reduction was low at about 12%. It was concluded that the aerobic digestion of chemical-biological sludge would be best for sludge storage and thickening. Dewatering studies indicated that both sludges were amenable to conventional processes. Two stage aerobic digestion followed by basket centrifugation seemed to be the most economical means of dewatering for the alum-biological sludge. (Collins-FIRL)

THE USE OF POLYMERS FOR IMPROVING CHEMICAL SLUDGE DEWATERING ON SAND BEDS,
Missouri Univ.-Columbia. Dept. of Civil Engineering.
J. T. Novak, and M. Langford.
Journal of the American Water Works Association, Vol 69, No 2, p 106-110, February, 1977. 13 fig, 3 tab, 8 ref.

Descriptors: *Dewatering, *Polymers, Drying, *Sludge treatment, *Waste water treatment, Solid wastes, Vacuum filters, Physical properties, Chemical properties, Economics.
Identifiers: Sand bed, Chemical sludges.

An evaluation was conducted of the effect of polymers on the improvement of sand bed dewatering of chemical sludges. Polymer conditioning was found to produce a sludge satisfactorily dewaterable on sand beds. Bed penetration was the condition which most frequently rules out sand bed use. Sludges of low cake solids and high specific resistance are considered most difficult to dewater by mechanical means, but they are susceptible to sand-bed dewatering. The long period needed for air drying makes other methods more economical for dewatering dense sludges such as lime-softened sludges. Most sludges with a substantial CaCO3 content have a relatively low resistance and can be dewatered by vacuum filter without added polymers. Specific characteristics of the sludge determine bed-surface requirements and the need for polymer conditioning. (Collins-FIRL)

TREATMENT OF COMBINED SEWER OVERFLOWS VIA THIN FILM CHEMISTRY,
New England Interstate Water Pollution Control Commission, Boston, Mass.
A. E. Peloquin, S. E. Poole, and F. K. Schauffler.
Journal Water Pollution Control Federation, Vol 49, No 2, p 206-215, February, 1977. 4 fig, 5 tab, 3 ref.

Descriptors: *Combined sewers, *Overflow, *Storm water, Water purification, Disinfection, Equipment, Polymers, Chlorine, Sludge disposal, *Waste water treatment, Costs, Rural areas, Septic tanks, Treatment, Ozone.
Identifiers: *Thin film chemistry, Sodium hypochlorite.

A new treatment system was described for combined sewer overflows and/or storm water discharges. Influent for the system is pumped from a manhole by two submersible screened-inlet pumps. It is discharged above the water line in a zone where mixing with lime and ferric chloride occurs. It is further mixed, an anionic polymer is added to aid floc growth, and then it is pumped into a high rate settler (HRS-1). Clarified waste water overflows to a flow equalization unit, and is pumped to a disinfection area, where it is disinfected by sodium hypochlorite using thin film technology. Disinfected waste water is pumped into HRS-2 and the effluent from HRS-2 is discharged into the river through a by-pass sewer. Sludge produced during treatment is discharged to the sewer line downstream of the influent manhole. This method is well-suited to treating overflows and an additional benefit would accrue from treating storm water mixed with the waste water. Cost reductions are expected from replacing chlorine with ozone, modifying chemical doses, and creating a new mixing system in the influent tank. Potential applications include treating small rural area waste water, septic tank pumpings, and holding tank wastes. (Collins-FIRL)

THE FABRIC-LINED PURIFICATION BASIN.
Journal of Coated Fabrics, Vol. 6, No. 3, p 137-138, January, 1977.

Descriptors: *Settling basins, *Linings, *Water purification, *Waste water treatment, Industrial wastes, Domestic wastes, Sewage effluents, Construction, Construction materials, Economics, Costs, Sealants, Roofing materials, *Plastics, *Treatment facilities.
Identifiers: Polyvinyl chloride(PVC), Diolen fabric.

The development of economical small and medium-sized waste water treatment facilities in Germany has become a major concern. This is primarily because waste water from nearly 50% of households and industries is still discharged unpurified. Excavated basins with feces-retaining membranes provide an economical solution to the problem. These basins may be covered or uncovered. Covered versions would allow placement nearer communities, thus eliminating expensive pipelines and odors, while providing a nonobjectional landscape. The prefabricated liner can be coated with polyvinyl chloride (PVC) as a sealant, and a PVC-coated high tenacity Diolen fabric can be used as a roofing material. (Collins-FIRL)

BACKWASHING OF GRANULAR FILTERS,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. L. Cleasby, J. Arboleda, D. E. Burns, P. W. Prendiville, and E. S. Savage.
Journal of the American Water Works Association, Vol 69, No 2, p 115-126, February, 1977. 10 fig, 3 tab, 53 ref, 1 append.

Descriptors: *Filters, *Cleaning, *Filtration, *Waste water treatment, Sewage treatment, Design criteria, Soil filters, Treatment facilities, Water purification.
Identifiers: *Backwash techniques.

Known practices and associated concerns for the backwashing of granular filters were summarized. This has become a field of interest due to the growing variation of practices used in the United States and abroad. The use of backwash techiques requires an awareness of potable water filtration technology since some backwashing methods involve full or partial fluidization of the filter media. High-rate backwashing is with full-bed fluidization and 20-50% bed expansion. Backwashing methods include: high-rate backwash; low-rate backwash; water backwash with surface-wash auxiliary; water backwash with air auxiliary; air scour followed by low-rate backwash with single-medium filters only; air scour followed by high-rate water backwash with single and multimedia filters; simultaneous air scour and low-rate water backwash followed by low-rate water backwash alone for single-medium filters only; and simultaneous air scour and low-rate water backwash followed by high-rate water backwash alone with single and multimedia filters. The choice of backwash method is partially dependent upon the type of filter medium selected. The various methods were described and further research was recommended. (Collins-FIRL)

EVALUATION OF IN-LINE AND SIDE-LINE FLOW EQUALIZATION SYSTEMS,
Johnson and Anderson, Inc., Pontiac, Mich.
G. W. Foess, J. G. Meenahan, and D. Blough.
Journal Water Pollution Control Federation, Vol 49, No 1, p 120-130, January, 1977. 6 fig, 6 tab, 9 ref.

Descriptors: Flow characteristics, *Flow control, *Flow rates, *Waste water treatment, Costs, Evaluation, Biochemical oxygen demand, Suspended solids, Filters, Performance, Phosphorus, Organic loading, Sludge treatment.
Identifiers: *Flow equalization, Side-line equalization, In-line equalization.

Experiments were conducted to evaluate flow equalization waste water treatment systems. Flow equalization has been considered a means of improving treatment processes and potentially lowering costs. One plant studied used a side-line equalization system where only above average flow was diverted through the equalization basin; the other used ab in-line system where all plant flow passes through the equalization basin. Both were very effective in smoothing influent flow variations and producing a uniform flow rate to plant processes. Their effectiveness was limited in leveling concentrations. Mass leveling was more a result of flow equalization than waste water blending. A five percent BOD reduction was noticed in the in-line basin. Operational variables such as organic loadings, intensity, mixed liquor settleability, and wind and current densities were more important to effluent quality than flow equalization. Similarly, BOD5, suspended solids, and soluble phosphorus removals resulted with and without flow equalization. Filter performance with flow equalization was superior to that with a diurnal flow. Power cost estimates indicated a less than 2% increase with flow equalization. (Collins-FIRL)

SOME FACTORS AFFECTING FLOC FORMATION BY ZOOGLOEA RAMIGERA, STRAIN I-16-M,
Agricultural Univ., Wageningen (Netherlands). Dept. of Microbiology.
J. M. Krul.
Water Research, Vol 11, No 1, p 51-56, 1977. 7 fig, 1 tab, 13 ref.

Descriptors: *Flocculation, *Activated sludge, *Salts, *Growth rates, *Bacteria, Sewage treatment, *Waste water treatment, Biological treatment, Sludge treatment, Treatment.
Identifiers: *Zoogloea ramigera.

Studies were conducted to determine factors which influence floc formation by Zooglea ramigera because it was long considered the major floc-forming organism of activated sludge. Floc formation was studied after resuspending pre-cultivated cells in fresh medium. The addition of NaCl or Na2HPO4/NaH2PO4 stimulated floc formation. FLocs of highly active cells were achieved because formation occured within 1-2 hours. Results of this study indicated that adding CaC12 or Na2SO4 to fresh medium with resuspended precultivated cells has no effect on floc formation. No explanation was found for the stimulation differences. Stimulated cell aggregation after resuspension of pregrown strain I-16-M cells was not generally characteristics of floc-forming bacteria. Ten floc forming strains, isolated from activated sludge and tested in the same manner, similarly failed to exhibit strongly stimulated cell aggregation. (Collins-FIRL)

THE EFFECT OF HIGH PURITY OXYGEN ON THE ACTIVATED SLUDGE PROCESS,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
L. D. Benefield, C. W. Randall, and P. H. King.
Journal Water Pollution Control Federation, Vol 49, No 2, p 269-279, February, 1977. 17 fig, 1 tab, 12 ref.

Descriptors: Analytical techniques, *Model studies, *Kinetics, *Activated sludge, *Oxygen, Air, Sludge treatment, Microorganisms, Growth rates, Treatment facilities, *Waste water treatment, Suspended solids, Evaluation.
Identifiers: Biochemical analysis, Substrate utilization.

An experimental design was developed to provide a valid comparison of substrate utilization and growth kinetics between air and oxygen activated sludge systems operated over a range of sludges found in normal plant operation. This design also included a biochemical analysis of sludge at various specific growth rates. Research indicated that differences in substrate utilization and cellular growth values for the two activated sludge systems occur when accepted methods are used for coefficient evaluation. The kinetic differences of the systems are due to the operational characteristics associated with small volume, high solids systems normally used with oxygen-aerated facilities. The failure of the volatile suspended solids test to distinguish between proliferating, active but non-proliferating, and inactive cellular material also contributes to this kinetic difference. PLANT DATA ANALYSIS OF TEMPERATURE SIGNIFICANCE IN THE ACTIVATED SLUDGE PROCESS,
New Brunswick Univ., Fredericton. Dept. of Civil Engineering.
K-C. Lin, and G. W. Heinke.
Journal Water Pollution Control Federation, Vol. 49, No. 2, p 286-295, February, 1977. 4 fig, 3 tab, 18 ref, 1 append.

Descriptors: *Temperature, *Activated sludge, Design criteria, Performance, Evaluation, Treatment facilities, Biochemical oxygen demand, Suspended solids, Sedimentation, Aeration, *Waste water treatment, Monitoring, Illinois, Canada.
Identifiers: Chicago(IL), Toronto(Canada).

Research was conducted to determine the importance of temperature in the activated sludge process, to demonstrate the effect of temperature on activated sludge performance, and to evaluate the use of temperature data in the design and control of activated sludge. Data was gathered from plants in Chicago and Toronto. Results indicated that temperature was second to raw waste water BOD5 and suspended solids concentrations in explaining BOD5 and suspended solids removals. Analysis of 26-year plant data proved the adverse effects of low temperature on activated sludge performance. The effect of temperature on primary sedimentation alone has not been determined. A larger aeration tank volume is needed with low temperatures. Reactor volume varies inversely as the square root of reaction rate. Temperature drops may occur in process water in primary and secondary settling tanks, but a maximum temperature can be found in aeration tanks when hot compressed air is used. Raw waste water temperature should be monitored continuously, as well as mixed liquor temperature. Temperature control would increase BOD5 removal. The use of hot compressed air in diffused aeration is preferred to mechanical surface aeration for maintaining high mixed liquor temperatures. (Collins-FIRL)

STUDY ON SEWAGE FLOW DYNAMICS THROUGH DORR TYPE CLARIFIER ON STREAM, (SYNOPSIS),
Technical Univ. of Warsaw (Poland). Inst. of Chemical Engineering.
A. Selecki, K. Zwolinski, A. G. Chmielewski, S. Babczynski, and K. Wild.
Chemie Ingenieur Technik, Vol. 49, No. 1, p 67, 1977. 2 fig, 3 ref.

Descriptors: Flow characteristics, *Dynamics, *Flow separation, *Sewage treatment, Tracers, Separation techniques, *Waste water treatment, Model studies, Effluents.
Identifiers: *Dorr type clarifier.

Results were presented from flow dynamics research with a Dorr type clarifier. With this apparatus, sewage enters a middle column under the liquid surface, sludge exits via outlets at the column bottom, and clear fluid reaches the sewer through the overflow. Radioactive tracers were added to the stream by an impulse method. Dynamic characteristics were studied by observations of residence time distribution function in response to the introduced pulse. Flow models were developed for an overcharged clarifier and for a normally charged clarifier. With an overall sewage flow rate of 750 cu m/hour, the clear liquid flow is nearly equal to plug flow with the occurrence of a sludge short circuit. No short circuiting occurred in the overcharged flow model. This may

be due to the fact that, at the given flow rate, streams outflowing from the diffusion cells in the column have significantly greater energy when compared to that at a flow rate of 451 cu m/hour. Experiments were conducted under severe conditions with results which were debatable. However, they may be considered a useful diagnostic method. (Collins-FIRL)

AGRICULTURAL DISPOSAL OF AEROBIC WASTEWATER SLUDGES IN AN URBAN COUNTY,
Clermont County Water and Sewer District, Batavia, Ohio.
A. B. Clark.
Deeds and Data, p D-1, D-8, D-9, January, 1977.

Descriptors: *Sludge disposal, *Fertilizers, Odor, Agricultural chemicals, Crops, Farms, Equipment, Waste water treatment, Sludge treatment, Aerobic treatment, *Ohio, Waste disposal.
Identifiers: Clermont County(OH).

Agricultural disposal of aerobic sludges in Clermont County, Ohio, was reviewed. The county is rapidly developing from a rural area to a suburban one, mainly in the western portion. The eastern area is still largely agricultural. Gaining the acceptance of farmers for the use of their lands is a major obstacle. Once their concern for their property is allayed, the economics of commercial fertilizer use makes sludge application an attractive alternative. Any odor problem with this sludge type is relatively negligible, but application near the farmhouse is generally avoided. It is suggested that application be made first to grass crops because of the high nitrogen and water content which produces rather dramatic improvements. The most satisfactory application system developed involved using a rain gun designed for agricultural irrigation. It is mounted on a two wheel trailer and fitted with a 3.2 centimeter orifice. The gun throws a full or part circle and the sludge is evenly distributed. Four to twelve 7.5 cu m loads may be discharged in one setting. The system has been used on dry frozen fields after crop removal, wet fields in the process of thawing, soggy pasture land, dry plowed fields, and fields of growing corn. No indication of herbicide failure has been noticed. (Collins-FIRL)

CONDITIONING AND LAND APPLICATION OF AEROBICALLY DIGESTED SLUDGE,
Montgomery County Sanitary Dept., Dayton, Ohio.
T. Yates.
Deeds and Data, p D2-D-3, January, 1977.

Descriptors: *Sludge disposal, *Sludge digestion, *Aerobic treatment, Metals, Liquid wastes, Economics, Equipment, Soil disposal fields, Waste water treatment, *Ohio, Waste disposal.
Identifiers: Montgomery County(OH).

Many consider sludge conditioning and disposal to be the most difficult phases of waste water treatment. This is especially true of aerobically digested sludge. More efficient plants and increased industrial sludges add to the problem, as does the refusal of farmers and land owners to allow sludge application because of concern over metals and other sludge components. It is usually the most expensive portion of treatment, involving collection, transportation, procesing, and final disposal. Gravity thickening of sludge is the most common process used in treatment plants. It is simple and inexpensive, unless there is a great distance to be traveled to the disposal site. The sludge produced is not as highly concentrated as that from other processes, causing more sludge to be transported. Most of the conditioning is done by wasting sludge gravity flow or pumping to aerobic digesters. The operation at the Montgomery County, Dayton, Ohio, plant was described. Because the plant has no sludge thickening equipment, polymers were added to a secondary settling tank to concentrate waste sludge. Methods of land application for sludge were discussed. Tank trucks may be used for transporting the sludge and spreading it on plowed farm land and pasture land, or it may be pumped from the side through a hose onto the land, if the area is not too wet to drive upon. A tractor with a vane-type vacuum-pressure pump can be used if disposal land is located near the treatment plant. More research was proposed to develop improved methods and equipment for sludge disposal. (Collins-FIRL)

ELIMINATION OF ANAEROBIC DIGESTER SUPERNATANT,
Envirex, Inc., Milwaukee, Wis.
N. A. Mignone.
Water and Sewage Works, Vol. 124, No. 2, p 48-49, February, 1977. 1 fig, 1 tab, 6 ref.

Descriptors: *Sludge digestion, *Anaerobic digestion, *Design criteria, *Sewage effluents, Sludge treatment, Dewatering, Heat treatment, Mechanical equipment, Treatment facilities, Separation, *Waste water treatment.

Secondary digesters are used to provide solid-liquid separation, thus reducing downstream sludge handling cost. Primary high rate anaerobic digestion combined with mechanical sludge dewatering may be more expedient. Present design practices produce a supernatant liquid stream that has a relatively poor quality. It has been felt that elimination of secondary digesters, and substitution of the above method, would not be detrimental to the treatment process. High rate anaerobic digestion and mechanical dewatering would not produce a variable supernatant stream, but one having a low solids content treatable by recycling to the influent of the secondary treatment process. Storage facilities to handle excess mechanical dewatering capacity would be unnecessary and primary digesters would provide enough non-sludge dewatering storage by using floating covers. Less land would be required. Raw sludge could be dewatered easily if the primary digester failed and a constant, predictable cake concentration would be produced for ultimate sludge disposal. (Collins-FIRL)

DESIGN CRITERIA FOR WASTE WATER AERATOR DRIVES,
P. Van Gelder.
Water and Sewage Works, Vol. 124, No. 1, p 66-69, January, 1977. 1 fig, 2 tab.

Descriptors: *Design criteria, *Aeration, Mechanical equipment, *Aerobic treatment, *Oxygenation, Water quality control, Treatment facilities, Legislation, Electrical equipment, Design, Corrosion control, *Waste water treatment.
Identifiers: *Aerator drives.

Because of stricter pollution control laws, industrial firms are beginning to develop new water treatment facilities with technology often beyond their normal spheres of operation. One important area is that of aerator drives. Mechanical aerators oxygenate ponded waste water to quicken aerobic digestion. Two basic aerator types are the fixed-platform and the floating aerator. An engineering survey is necessary to determine the one best suited for any application. Several considerations are presented, although the most important is the definition of application conditions. It has been found that a totally enclosed fan-cooled motor is the only one suited for aerator drives. Concern should be given to the choice of voltage, factors of insulation and service, corrosion-proofing, and other protective devices. The latter include temperature and overload protectors, condensation protection, and vibration protection. Safety factors relative to motor operation require that lifting devices withstand forces five times the weight of the motor; that excessive motor speeds be eliminated; and that there is proper grounding. Various factors affecting gear reducer and driver operation were considered, including gear case design, lubrication, and loading. (Collins-FIRL)

PURIFYING WATER,
Commonwealth Scientific and Industrial Research Organization, Canberra (Australia).
In: CSIRO (Australia) Annual Report, No. 28, p 37-40, 1975/76. 2 fig.

Descriptors: *Water quality, *Water purification, *Water reuse, *Polymers, *Chemical treatment, Desalination, Sewage effluents, Industrial wastes, Heat treatment, Ion exchange, Resins, Pollution abatement, *Waste water treatment, *Australia, Water treatment.

Australian needs to purify water of poor quality for domestic and industrial use are expected to become urgent in the next 10 years. Desalination will be one of the processes used on a large scale for this purpose. Water from sewage and industrial effluents will also be recycled. Investigations are being made to study the use of polymers in water purification. Desalination with heat-regenerable resins used with polymer particles was thought to be economical, but micro-particles caused some handling problems. Techniques have been developed for the combination of acidic and basic micro-particles into conventional-sized composite beads which can be handled normally. Resins have successfully reduced water salt content from 3000 milligrams/liter to as low as 50-100 milligrams/liter. A desalination plant at Adelaide removes 80% of water salinity and produces 600 cubic meters of purified water per day. Modified polymers have been used for a great range of ion-exchange processes. Bicarbonate, calcium, magnesium ions, and heavy metals have been removed by these processes and they have been used to soften and decolor water. The use of resins has made possible a relatively continuous purification process since they are added at one end of a column and withdrawn and regenerated at the other. Magnetic polymers have been used as filter aids. Physical and chemical treatment processes studied include the use of lime treatment, ammonia stripping with air, coagulation with iron salts, sand filtration, chlorine disinfection, and activated carbon treatment. UPGRADING BIOLOGICAL SEWAGE TREATMENT PLANTS TODAY,
Environmental Science and Technology, Vol. 11, No. 2, p 124-125, February, 1977.

Descriptors: *Treatment facilities, *Biological treatment, *Municipal wastes, *Chemical treatment, Aerobic treatment, Anaerobic conditions, Sludge digestion, Alkalinity, Hydrogen ion concentration, Nitrification, Lime, Settling basins, *Waste water treatment.
Identifiers: Sodium bicarbonate, Alum, Sodium hydroxide, Buffering.

Sodium bicarbonate has become a viable treatment chemical alternative. It is useful in adjusting pH, providing reserve alkalinity, and increasing efficiencies of aerobic and anaerobic processes. In a water treatment plant it can be added at any point giving access to the system. In secondary treatment plants, it can be added at the influent inlet of an aerobic system, at the primary settling tanks, or at the vacuum break of a digester. Sodium bicarbonate is most useful in plants with 5 mgd flow with mostly low pH or acidic wastes. The treatment is uneconomical with facilities having a flow less than this. It is safe to handle, a natural buffer, and cannot be overdosed. No amount of dosing produces a pH greater than 8.1 to 8.3. Sodium bicarbonate was not widely used in municipal sewage treatment because lime, alum, and other chemicals had been successful over the years. With stricter requirements for effluent quality and monitoring, evaluation of sodium bicarbonate and its subsequent use increased. The relative ease and safety of sodium bicarbonate use make it an attractive alternative, especially where pH levels above 6.5 are required. (Collins-FIRL)

STABILISATION LAGOONS INCLUDING EXPERIENCE IN BRAZIL. PART 1,
R. M. Bradley, and M. O. S. Alvares Da Silva.
Effluent and Water Treatment Journal, Vol. 16, No. 12, p 619-622, 624-625, December, 1976. 1 fig, 6 tab, 40 ref.

Descriptors: *Design criteria, *Oxidation lagoons, *Aerated lagoons, *Anaerobic treatment, *Aerobic bacteria, Sewage lagoons, Photosynthesis, Sludge treatment, *Waste water treatment, Industrial wastes, Methane, Temperature, Hydrogen ion concentration, Biological treatment.
Identifiers: Aerobic lagoons, Facultative lagoons, Polishing lagoons.

Design criteria for stabilization lagoons are summarized. Under discussion are anaerobic, aerobic facultative, aerated, and polishing lagoons. Because numerous factors are involved in algal-bacterial processes, a rational design procedure is difficult to establish and many different methods are used. Principal factors which affect anaerobic lagoon purification efficiencies are temperature, pH, liquid detention time, and solids retention. Efficient methane production is ensured in a pH range of 6.8 to 7.2; BOD reduction is usually about 50% to 70%. The use of aerobic lagoons requires a knowledge of the density of algal cells and a method of relating oxygen production to light conversion efficiency and light intensity. A rational design procedure has been developed specifically for aerobic lagoons. Falcultative lagoons achieve purification of organic wastes by aerobic and anaerobic processes in inter-related reactions, and many are designed on the basis of organic loading rates. Polishing lagoons are designed on the basis of detention time for the purpose of improving effluent which has received a high degree of purification by previous biological treatment. Increased algal growth and higher suspended solids levels and turbidity in the final effluent must be balanced against the increased reduction of bacteria and viruses resulting from longer detention times. Specific design criteria, based on experience with stabilization lagoons, were presented. (Collins-FIRL)

THE CURRENT ROLE OF WASTEWATER DISINFECTION,
K. L. Murphy.
Water and Pollution Control, Vol. 115, No. 1, p 13-16, 36, January, 1977. 5 fig, 4 tab.

Descriptors: *Disinfection, *Waste water treatment, *Municipal wastes, *Chlorination, Coliforms, Pathogens, Water utilization, Infection, Environmental sanitation, Ammonia, Organic compounds.
Identifiers: Hypochlorous acid, Amino groups.

Disinfection has become a unit process in municipal waste water treatment, primarily because of the success of chlorination. This process reduces disease-causing enteric pathogens which would otherwise impair potable water sources, shellfish harvesting areas, and recreational resources. The number of coliforms in water for certain uses has been limited by law. Studies have been conducted to determine the relationship of water quality to risk of infection, but no concise conclusions have been drawn. In addition to chlorine, hypochlorous acid (hypochlorite ion), which reacts with ammonia and amino groups to form chloramines, is also used as a disinfectant. Studies relating to disinfection of waste water by these substances and their effects on pathogenic organisms are reviewed. Because effluent toxicity may be increased by chlorination, careful monitoring should determine whether overall benefits exceed negative environmental effects. (Collins-FIRL)

FUEL GAS AND ELECTRICITY FROM MUNICIPAL SEWAGE,
R. D. Bargman, and J. M. Betz.
In: Symposium on Clean Fuels from Biomass, Sewage, Urban Refuse, and Agricultural Wastes, January 27-30, 1976, Orlando, Florida, p 115-121. 4 tab.

Descriptors: *Fuels, *Methane, *Gases, *Activated sludge, Sludge treatment, *Biological treatment, Methane bacteria, Energy, Electricity, Treatment facilities, Microorganisms, *Waste water treatment, California.
Identifiers: Hyperion Treatment Plant, Los Angeles(Calif).

Methane gas can be a useful by-product of activated sludge treatment. This aspect of waste water treatment has gained interest since a federal law now requires secondary treatment of waste water before disposal. Methane gas is formed by a biological process during which micro-organisms decompose organic matter during sludge treatment. The City of Los Angeles, California, operates the Hyperion Treatment Plant which has produced methane by this process for 25 years. In this, as in most instances, methane gas production is insignificant in comparison to community needs, but is usually quite enough to operate machinery at the plant with the possibility of some excess as production. In addition to providing gas for diesel engines for driving compressors or producing electricity, this plant also provides energy for the start-up process of a nearby power plant in emergency cases. The total electrical energy produced by the plant is 140,000 kwh/day at a cost of $.0120/kwh. The gas produced contains 65% methane and 35% carbon dioxide and provides about 94% of the fuel requirements of the plant's diesel engines. (Collins-FIRL)

EXPERIENCE IN TREATING WASTE WATERS FROM THE DONETSK MINES, (IN RUSSION),
Donetsk Municipal Sanitation Epidemiology Station (USSR).
V. I. Solov'ev, N. V. Grin', E. A. Rodoshkevich, and I. I. Maiboroda.
Gig Sanit 3, p 95-97, 1976.

Descriptors: Bacteria, *Waste water treatment, Mines, Settling basins, Filters, Electrolysis, Electrothialysis, *Mine wastes, Water pollution.
Identifiers: *Donetsk(Ukranian SSR), USSR.

Means of treating the 173,000 m3 daily waste water discharge containing bacteria from the Donetskugol' mines into the open reservoir of the city of Donetsk (Ukrainian SSR, USSR) are described. In the past 10 yr an extensive project was completed to replace horizontal settling basins with fountain ponds, rock filters, underground pressurized sand filters with electrolysis and an electrodialysis installation. Laboratory tests conducted between 1962-73 indicated substantial progress in reducing suspended particles in the Donetsk discharge waters.--Copyright 1977, Biological Abstracts, Inc.

ADVANCED WASTE TREATMENT SEMINAR SESSION III, REMOVAL OF SOLIDS AND ORGANICS, HELD AT SAN FRANCISCO, ON OCTOBER 28-29, 1970.
Federal Water Quality Administration, San Francisco, Calif. Pacific Southwest Regional Office.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 050 Price codes: A04 in paper copy, A01 in microfiche FWQA Report, (1970). 69 p, 23 fig, 5 tab, 31 ref.

Descriptors: *Conferences, *Solids contact processes, *Design criteria, *Organic matter, Separation, Sedimentation, Filtration, Performance, Economics, Sludge treatment, Sludge disposal, Waste treatment, Waste disposal, Oxidation, Dewatering, Chemical treatment, Activated carbon, Oxygen, Oxygenation, Treatment, *Waste water treatment.

A report of a seminar on the removal of solids and organics in waste treatment was presented. Design criteria were presented for removal processes such as horizontal and vertical-upflow sedimentation tanks, and tube and lamella settlers. Dissolved air flotation, screening devices, in-depth filtration, ultrafiltration, and activated sludge processes

were evaluated from performance and economic viewpoints. New developments in sludge handling and disposal were discussed, including ocean and land disposal, disposal of organic sludge, wet sludge treatment, oxidation, dewatering, and chemical treatment. Activated carbon treatment and the use of pure oxygen in solids removal were also evaluated. (Collins-FIRL)

ADSORPTION, COAGULATION AND FILTRATION MAKE A USEFUL TREATMENT COMBINATION-PART 2,
Rensselaer Polytechnic Inst., Troy, N.Y.
L. K. Wang, R. G. Ross, and V. J. Ciccone.
Water and Sewage Works, Vol. 124, No. 1, p 32-36, January, 1977. 2 fig, 5 tab, 17 ref.

Descriptors: *Waste water treatment, *Adsorption, *Coagulation, *Filtration, *Domestic wastes, Domestic water, Activated carbon, Polyelectrolytes, Sludge, Design criteria, Treatment.

The use of a mobile water purification unit in waste water treatment has been investigated. The unit combines adsorption, coagulation, and filtration processes. In testing, the mobile unit was adapted for treatment of kitchen, field laundry, and shower waste waters. The unit contained three 1500 gallon collapsible storage tanks and one blending tank of the same capacity for waste water equalization. Treatment also involves using powdered activated carbon, polyelectrolytes, sludge concentration, and a diatomite filter. Another change made was the use of the raw water pump for pumping waste water from the mixing tank to the Erdlator (upflow clarifier) tank. The unit was designed for transport on rotary and fixed-wind aircraft and general purpose lightweight ground vehicles. Each waste water stream was individually treated before combined treatment proceeded. Treatment results indicated turbidity removal of 99.9%, BOD removal of 81%, and TOC removal of 92%. ANAEROBIC FILTER TREATS WASTE ACTIVATED SLUDGE,
Loyola Univ., Los Angeles, Calif.
R. T. Haug, S. K. Raksit, and G. G. Wong.
Water and Sewage Works, Vol. 124, No. 2, p 40-43, February, 1977. 4 fig, 4 tab, 8 ref.

Descriptors: *Filters, *Anaerobic conditions, *Heat treatment, *Dewatering, Sludge treatment, Sludge disposal, Solid wastes, Pollution abatement, Disposal, Sewage effluents, Suspended solids, Activated sludge, *Waste water treatment, California.
Identifiers: Los Angeles(Calif).

The State of California has ruled against ocean disposal of waste water solids. The City of Los Angeles has studied alternate disposal schemes including treatment of liquors from thermal conditioning of waste activated sludge by anaerobic filters. This process involved thickening sludge and subjecting it to thermal conditioning at 350 F for about 30 minutes. As much as 60-70% of suspended solids were solubilized, producing a solids content of about 1.2% after conditioning. A 9% sludge was obtained with dewatering characteristics that produced a 40% cake after centrifuging without chemical additions. Thermal conditioning entailed several problems: odor control; corrosion and organic fouling of heat exchanger tubes; the need for heat energy; and necessary treatment of the decanted liquor and centrate (heat treated liquor) before disposal. The anaerobic filter was investigated for treatment of this liquor. The reactor provides an upward fluid flow through a fixed media bed. Very short hydraulic detention times and long solids retention time can be maintained easily. It cannot handle wastes with high concentrations of suspended solids. Because this heat treated liquor has low solids concentrations, it was well-suited for the process. Results indicated 85% BOD removals and 76% COD removals with a 2-day hydraulic detention time; methane production would off-set much of the process energy requirement; and disposal by heat treating, followed by dewatering and thickening with anaerobic filter treatment of the liquor, is a promising disposal method. Further research, however, is necessary. (Collins-FIRL)

LAND APPLICATION OF SEWAGE SLUDGE: IV. WHEAT GROWTH, N CONTENT, N FERTILIZER VALUE, AND N USE EFFICIENCY AS INFLUENCED BY SEWAGE SLUDGE AND WOOD WASTE MIXTURES,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
B. R. Sabey, N. N. Agbim, and D. C. Markstorm.
Journal of Environmental Quality, Vol. 6, No. 1, p 52-58, January-March, 1977. 3 fig, 4 tab, 18 ref.

Descriptors: *Sewage disposal, *Wheat, *Wood wastes, *Nitrogen compounds, Soil contamination, Water pollution, Growth rates, Organic matter, Inorganic compounds, Sludge disposal, *Waste water treatment, Fertilizers, Sewage sludge.
Identifiers: Land disposal.

A study was conducted to measure several parameters involving digested sewage sludge and wood waste materials and land application. These included total N and NO3-N in wheat and total N, NH4-N, and NO3-N in soil after wheat harvesting. Inorganic fertilizer was added, with and without the organic matter, to aid evaluation of fertilizer potential of various rates and mixtures of organic materials on greenhouse-grown wheat. Four rates of sewage sludge and wood wastes, ranging from 22.4 to 224 metric tons/hectare, were used. Every mixture but 50% bark-50% sludge increased wheat growth. Greatest growth occurred at the 224 metric ton rate with 50% wood-50% sludge, 25% bark-75% sludge, and 25% wood and bark-75% sludge. Highest application rates of 100% sludge, 25% wood-75% sludge and 50% bark-50% sludge caused less growth than the next lower application rates. Equations were derived to express the relationship between wheat growth and N content in the plant tissue. Amounts of total N, NH4-N, and NO3-N remaining in greenhouse pots after harvest usually increased as the application rates of treatment increased. Care was suggested for application of 112 and 224 metric tons/hectare of 100% sludge and 25% wood-75% sludge, and 224 metric tons/hectare of 25% wood and bark-75% sludge due to possible NO3-N accumulation and groundwater pollution. Ammonium N did not accumulate excessively. Estimations were that 2 to 22.7% initial N was taken up by plants during the study period of 50 days. (See also W76-10841) (Collins-FIRL)
W77-07079

APPLICATION OF MUNICIPAL REFUSE AND LIQUID SEWAGE SLUDGE TO AGRICULTURAL LAND: II. LYSIMETER STUDY,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
L. D. King, A. J. Leyshon, and L. R. Webber.
Journal of Environmental Quality, Vol. 6, No. 1, p 67-71, January-March, 1977. 1 fig, 6 tab, 6 ref.

Descriptors: *Waste disposal, *Sludge, *Liquid wastes, Wastes, *Lysimeters, Nitrogen compounds, Municipal wastes, Nitrogen compounds, Leachates, Denitrification, Chemical oxygen demand, Oxygen demand, *Waste water treatment, Anaerobic conditions, *Water reuse, *Sewage sludge.
Identifiers: Land disposal.

A lysimeter study was conducted to determine whether agricultural land could be simultaneously used for waste disposal-utilization and crop production. Liquid sewage sludge and unsorted, pulverized municipal refuse was used. Refuse was applied at 188 metric tons/hectare and a 2.3 centimeter depth of sewage sludge was applied separately and in combination. A double refuse-sludge rate and a control treatment were also studied. Results partially confirmed the assumption that the addition of refuse to sludge would create a C/N ratio which would allow enough N mineralization for crop growth but prevent excess leaching loss of NO3-N. Compared to the sludge treatment, the combined treatment reduced NO3-N by 33% and the refuse treatment caused leaching of NO3-N equal to that of the control situation. Refuse treatment produced 43% more total corn yield than the control and released more nitrogen than the leachate data suggested. There was no significang difference between refuse and control treatment soil nitrate levels. The soil environment limited NO3-N formation and favored denitrification in the combined treatment area, explaining the lack of significant NO3-N leaching in the test. COD levels were high and the leachate had a septic odor, indicating anaerobic conditions in the lysimeters from the high oxygen demand of decomposing organic material. The amount of NH4-N leached also supported this conclusion. Though the combined treatment is not a short term pollution problem relative to NO3-N, highleachate COD and high Zn and Cd levels in plant material suggest this land application of refuse alone or in combination with sludge is an acceptable utilization/disposal method. THE ELECTROLYTIC RESPIROMETER-II. USE IN WATER POLLUTION CONTROL PLANT LABORATORIES,
Iowa State Univ., Ames. Dept. of Civil Engineering.
J. C. Young, and E. R. Baumann.
Water Research, Vol 10, No 12, p 1141-1149, 1976. 5 fig, 5 tab, 12 ref.

Descriptors: *Respiration, *Electrolysis, *Oxygen demand, *Oxygen requirements, *Biochemical oxygen demand, Evaluation, Pollution abatement, Nitrification, *Waste water treatment, Industrial wastes, Biodegradation, *Pollutant identification.

A study was conducted to determine the suitability of the electrolytic respirometer for in-plant BOD measurement, to evaluate its advantages, disadvantages, and range of use beyond single-point BOD measurement, and to collect electrolytic BOD data for comparison with standard dilution method BOD measurements. The study was in three parts, coinciding with these objectives. Conclusions and recommendations developed from resultant data were that the electrolytic respirometer provides reliable and precise measurement of BOD and should be accepted by pollution control agents as a supplement to or substitute for standard dilution; that data from a 3-day, 20 C electrolytic BOD test period are equal to that of a 5-day standard 20 C dilution test; that the ease of obtaining the complete BOD curve is a major advantage and helpful in evaluating industrial waste biodegradability; and that nitrification control should be a standard practice in BOD measurements conducted by any method. (Collins-FIRL)

M. Boller.
Gas-Vasser-Abwasser, Vol 56, No 11, p 615-622, 1976. 15 fig, 4 tab, 11 ref.

Descriptors: *Filtration, *Flocculation, *Phosphorus, Analysis, Suspended solids, Costs, Cost-benefit ratio, *Waste water treatment, Performance, Evaluation, Filters, Design, Nitrification.

Advanced phosphorus removal process combinations with contact filtration as the last stage were evaluated in pilot scale experiments. The study indicated that contact filtration is especially feasible in the intake areas of lakes which are heavily loaded with phosphorus due to large point sources. The combination of contact filtration with other processes leads to very low phosphorus and suspended solids concentrations, averaging 0.1-0.4 milligrams/liter (phosphorus) and 0-5 milligrams (dry solids). An approximate calculation of annual costs for various phosphorus elimination processes and the annual costs per personn for contact filtration combined with simultaneous precipitation indicated that they were about equal to those of a pH 9 post-precipitation system. More stable elimination performance and lower sensitivity to hydraulic shock loads are added advantages which shift the cost-benefit effect further in favor of contact filtration. Conclusions are reached concerning the design of contact filters for waste water treatment. (Collins-FIRL)

TRENDS IN SLUDGE TREATMENT AND DISPOSAL PRACTICES IN THE UNITED STATES,
Municipal Environmental Research Lab., Cincinnati, Ohio.
J. B. Farrell.
In: Polish/U.S. Symposium on Waste Water Treatment and Sludge Disposal, February 10-12, 1976, Cincinnati, Ohio, EPA Environmental Research Center, Cincinnati, Vol 2, p 11-17. 1 tab, 11 ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Waste water treatment, *Environmental sanitation, Groundwater, Water pollution, Landfills, Sewerage, Incineration, Planning, Heavy metals, Standards, Fuels.
Identifiers: Ocean disposal, Composting, Pyrolysis.

Sludge disposal in the United States was a nuisance situation resulting from waste water treatment. Until recently, most sludge treatment procedures and equipment were borrowed from existing technology with little need for innovation. No standards were developed for sludge treatment which were comparable to those of waste water treatment. Cost has been the greatest factor in sludge treatment and disposal. This situation has begun to change. Several factors which now influence disposal include: process considerations, disposal choice, site and related circumstances, and ecological considerations. Protection and conservation have become major factors in treatment and disposal during the past decade. Oceans, as well as communities, must be protected from environmental dangers of improper disposal. Odor, particulate discharge, and groundwater pollution must be controlled or eliminated. Proper safeguards should be developed relative to incineration and landfilling. Resource conservation must also be emphasized. Efforts are underway to develop methods for control of sludge composition in sewers and landfills, incinerator standards for heavy metals, and fuel conservation in sludge treatment processes. The future seems to indicate discontinued ocean disposal, coincineration and copyrolysis with solid wastes, conversion of sludge to other forms, and improved beneficial land disposal methods. (Collins-FIRL)
W77-07083

COMPOSTING OF SEWAGE SLUDGE AND SOLID WASTE MATTER,
Department of Waste Water Technology and Sludge Disposal, Warsaw (Poland). Local Economy and Environment Protection.
J. Cebula.
In: Polish/U.S. Symposium on Waste Water Treatment and Sludge Disposal, February 10-12, 1976, Cincinnati, Ohio, EPA Environmental Research Center, Cincinnati, Vol 2, p 18-32. 5 fig, 4 tab, 28 ref.

Descriptors: *Sludge treatment, *Sludge disposal, *Solid wastes, *Industrial wastes, *Municipal wastes, *Domestic wastes, *Heavy metals, Trace elements, Environmental sanitation, Organic matter, Analysis, *Sewage sludge.
Identifiers: *Composting, *Gluszyca(Poland).

Textile and chemical sludges were composted with municipal solid wastes at the Gluszyca, Poland, treatment plant to determine the value of composting in sludge management. Six areas were studied: treatment and preparation of sewage sludges for final disposal; characteristics of domestic wastes accumulated in the catchment area; joint sludge and wastes composting; role and effects of heavy metals on soils and plants; and practical aspects of sludge compost usage. Sludges were analyzed after dewatering and thickening. They contained less organic matter and essential components, in considering fertilizing and biological properties (C, H, N, P, K, Ca), than household solid wastes. The latter contained 61% fractions by weight and most of the organic matter suitable for composting. Sludge was difficult to dewater, emitted a disagreeable odor, and was greasy before composting. Afterwards the compost was not sticky and was easy to apply on soil. It stimulated plant growth. A 6 to 8% sludge content and 10 t/ha dose were considered optimum. Mathematical statistics were used to determine trace element occurrence distribution as well as the reliability of results. The variability of occurrence was found to be a useful tool in establishing the suitability of sludge for agricultural disposal and indicated the potential toxicity of soil under consideration. It was concluded that industrial composts were suitable for agricultural use. (Collins-FIRL)

EFFECT OF WATER WORK'S SLUDGE ON WASTE WATER TREATMENT,
Instytut Gospodarski Komunalnej, Warsaw (Poland).
J. Zakrezewski.
In: Polish/U.S. Symposium on Waste Water Treatment and Sludge Disposal, February 10-12, 1976, Cincinnati, Ohio, EPA Environmental Research Center, Cincinnati, Vol. 2, p 33-41. 3 tab.

Descriptors: *Waste water treatment, *Sludge treatment, *Municipal wastes, Biological treatment, Activated sludge, Sludge digestion, Laboratory tests.
Identifiers: Post-coagulation sludge, Sludge thickening.

Results were presented of laboratory studies which evaluated post-coagulation sludge on municipal sewage treatment and municipal sludge disposal. Results indicated a limited effect on the mechanical treatment of municipal sewage and on activated sludge treatment of municipal sewage. The presence of post-coagulated sludge in raw sewage does not provide any important effect on mechanical-biological treatment of sewage. Addition of the study sludge slightly decreases thickening and sludge digestion. Further research is suggested to verify these conclusions. (Collins-FIRL)
W77-07085

RENOVATED WATER FROM MUNICIPAL SEWAGE TREATMENT PLANTS,
Wroclaw Technical Univ. (Poland). Inst. of Environment Protection Engineering.
A. L. Kowal.
In: Polish/U.S. Symposium on Waste Water Treatment and Sludge Disposal, February 10-12, 1976, Cincinnati, Ohio, EPA Environmental Research Center, Cincinnati, Vol 2, p 141-150. 10 tab.

Descriptors: *Reclaimed water, *Trickling filter, *Activated sludge, *Coagulation, *Sedimentation, Carbon, Filtration, Sorption, Treatment facilities, *Waste water treatment, Laboratory tests, Pilot plants, Sludge treatment.
Identifiers: Renovated water, Recarbonation.

Laboratory and pilot tests were conducted to investigate the renovation of secondary effluent from a trickling filter and an activated sludge process. Coagulation, sedimentation, recarbonation, filtration and sorption were used. Trickling filter test results showed treatment efficiency as follows: 77.8% reduction of permanganate, 86.1% BOD removal, 33% ammonia nitrogen reduction, and 37.1% phosphate removal. The secondary effluent coagulated with lime or aluminum sulfate and was subjected to sedimentation, filtration on a sand bed, and passage through the activated carbon filters. Sewage was recarbonated with carbon dioxide before filtration when lime was used. A simultaneous coagulation with carbon slurry provided the best laboratory results. Pilot plant studies with aluminum sulfite or lime did not significantly remove ammonia nitrogen. Calcium oxide was reduced when filtered on a sand-anthracite bed and further reduced on a sand-carbon bed. Permanganate was significantly decreased, although sewer hardness was very high. Laboratory tests with the activated sludge reduced permanganate by about 50%, and removed phosphate and turbidity. High concentrations of either required high lime doses. Recarbonation was achieved by bringing carbon dioxide to the water and coagulating with lime, mixing rapidly, bringing pH up to 8.3, mixing slowly, settling, and decanting. The best alkalinity and hardness removal occurred with recarbonation after coagulation and sedimentation. Raised permangante values were found in all recarbonated water samples. Coagulation with ferric or aluminum sulfate resulted in increased dissolved solids concentrations. (Collins-FIRL)
W77-07086

WASTE WATER REUSE PRACTICE IN THE UNITED STATES,
Municipal Environmental Research Lab., Cincinnati, Ohio.
C. A. Brunner.
In: Polish/U.S. Symposium on Waste Water Treatment and Sludge Disposal, February 10-12, 1976, Cincinnati, Ohio, EPA Environmental Research Center, Cincinnati, Vol. 2, p 151-156. 4 tab.

Descriptors: *Water reuse, *Municipal waste water, *Water demand, *Waste water treatment, *Water conservation, *Water purification, Sewage treatment, Water sources, Groundwater, Irrigation, Domestic water, Lakes, Industrial water, Recreation.

The reuse of treated municipal waste water should be considered as an alternative plan for meeting future water demands. Present usage and future predictions of water demands make water resource conservation, renovation, and reuse of waste water imperative. Presently, waste water reuse is being applied to agricultural, industrial and recreational problems. Nonpotable domestic water applications are to be added to this group, as well as potable uses which may be practical at some future time. An EPA survey reported that 58% of water reused in 1971 was for agricultural purposes, with the great majority being used in irrigation. Forty percent was used for industrial needs. Much of this was used as cooling water. Recreational reuse programs include man-made

lakes. For these uses, water must be treated to maintain a low oxygen demand and to keep toxicity levels low. Domestic reuse schemes do not yet include potable water programs, and one problem is the necessity for a separate distribution system for the renovated water. Trace organics and pathogens, especially viruses, are the major restrictive agents in the development of water reuse programs for potable water needs. (Collins-FIRL)
W77-07087

SLUDGE DEWATERING PILOT PLANT DESIGN. PART 2,
New Jersey Inst. of Tech., Newark. Dept. of Civil and Environmental Engineering.
P. M. Cheremisinoff.
Water and Sewage Works, Vol. 123, No. 12, p 64-67, December, 1976. 2 fig, 23 ref.

Descriptors: *Sewage disposal, *Dewatering, *Sludge treatment, Filtration, *Pilot plants, On-site tests, Treatment facilities, *Waste water treatment, Pumps, Temperature.

The design of a pilot plant for on-site or laboratory pilot testing was presented. The design was for a system which would operate during the entire cycle and have integrated recorders to graph pressure and total flow for the cycle. Criteria established included: a 15 gallon capacity and a filter press; the duplication of actual treatment and process control; equipment for chemical and heat treatment before dewatering; full instrumentation and recording devices for documentation of the filtration cycle for scale-up to the actual system; easy portability and ruggedness; a 3 to 10%, by weight, range for sludge suspended solids; constant pressure filtration; and automatic system controls. Design specifications were given for sludge storage and heat treatment vessels, chemical addition pumps, and the automatic control apparatus. (Collins-FIRL)
W77-07088

METHOD OF TREATING WASTE WATER WITH JET NOZZLES,
Badische Anilin-und Soda-Fabrik A.G., Ludwigshafen am Rhein (West Germany). Landwirtschaftliche Versuchsstation. (Assignee).
K. Hess, R. Stickel, O. Nagel, and R. Sinn.
United States Patent 4,009,100. Issued February 22, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 4, p 1263, February, 1977. 1 fig.

Descriptors: *Patents, *Activated sludge, *Aeration, Equipment, Gases, Air, Oxygen, Sludge treatment, *Waste water treatment, Water purification, Waste treatment, *Jets.

A patent was issued for a treatment process for activated sludge systems with aerating nozzles submerged in the waste water and activated sludge contained in a reservoir. A gas stream of air or high-oxygen gas is propelled through the nozzles, near the bottom of this mixture, into a small impulse exchange tube. A directional flow is produced in a rotary motion by ascending bubbles to create a screw motion flow in the waste water/activated sludge mixture. (Collins-FIRL)

WASTE TREATMENT PROCESS,
Ecolotrol, Inc., Bethpage, N. Y. (Assignee).
J. S. Jeris.
United States Patent 4,009,098. Issued February 22, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 4, p 1262, February, 1977. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Biochemical oxygen demand, *Oxidation, Oxygen, Microorganisms, Suspended solids, Aerobic treatment, Aerobic conditions, Waste treatment.

A patent was issued for a waste water treatment process for BOD removal. Waste water passes through a bed of microorganisms which oxidizes BOD under aerobic conditions and allows suspended solids to pass through it. This produces an upflow fluidized bed of solid particulate carrier by passing waste water up at a flowrate of 6+ gallons/minute/square foot of bed. About 1.5 milligrams of oxygen per milligram of BOD removed from the waste water are provided to allow the microorganisms to reduce BOD. Specific gravity of the particles is increased by removal of excess microorganism growth from the bed to aid BOD removal. Floc produced by excess growth removal is taken from the process without any interference with operational efficiency. (Collins-FIRL)
W77-07091

CLARIFIER WITH OVERFLOW SCUM REMOVAL,
Envirex, Inc., Milwaukee, Wis. (Assignee).
G. W. Smith.
United States Patent 4,009,106. Issued February 22, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 4, p 1265, February, 1977. 1 fig.

Descriptors: *Patents, *Separation technique, *Waste water treatment, Sewage treatment, Equipment, Water purification, Sewage effluents, Treatment, Sludge.
Identifiers: Clarifier, Scum removal.

A patent was issued for a sewage treatment clarifier. The clarifier has a circular outer wall with submerged feed ports, a conical bottom defining a lower sludge collection area, a sludge return line from the lowest portion of this area, and a circular overflow launder that establishes the normal liquid level in the clarifier. A circular scum trough, a frusto-conical baffle, and a scum collection zone are other features of the system. (Collins-FIRL)
W77-07092

PROCESS FOR THE PURIFICATION OF WASTE WATERS WITH ACTIVATED CARBON,
Bergbau-Forschung G.m.b.H., Essen (West Germany).
G. Gappa, H. Juntgen, and J. Reichenberger.
United States Patent 4,007,116. Issued February 8, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 2, p 581, February, 1977. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Activated carbon, Organic carbon, Treatment facilities, Equipment, Sewage treatment, Sewage effluents, Water purification, Sanitary engineering.

A patent was issued for an activated carbon waste water treatment process. Waste water is pased upward through a column of activated carbon particles and distributed equally over the cross-sectional area. Total organic carbon is determined before water enters the column and simultaneously at a point between 30 and 70% of the carbon particles height in the column. Spent carbon particles are withdrawn from the column bottom at a rate which maintains a selected difference between total organic carbon content of water entering the column and at the above selected point. Fresh activated carbon or reactivated carbon is constantly introduced at the column top to compensate for the withdrawal. Purified water is recovered at the top of the column. (Collins-FIRL)

OZONE OXIDATION OF WASTE WATER,
Cubic Corp., San Diego, Calif. (Assignee).
D. F. Ciambrone.
United States Patent 4,007,118. Issued February 8, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 2, p 581-582, February, 1977. 1 fig.

Descriptors: *Patents, *Oxidation, *Ozone matter, *Bacteria, *Waste water treatment, Oxides, Equipment, Metals, Sewage treatment.

A patent was issued for an ozone oxidation treatment method for waste water containing organic contaminants and bacteria. Waste water is injected into a closed tank, submerging fluid-pervious bags containing powdered metal oxide catalyst (manganese trioxide, ferric oxide, nickel oxide or copper oxide); ozone is injected into the bags for exposure to the catalyst and reaction with waste water flowing through the bags. Purified and inert water is drawn from the tank and ozone is vented from the upper part of the tank. (Collins-FIRL)

INTEGRATED APPROACH TO URBAN WASTE WATER MANAGEMENT,
Florida Univ., Gainesville.
S. M. Hasan.
Available from the University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 77-1117. PhD Thesis, 1976, 253 p.

Descriptors: *Water management(Applied), *Urban drainage, *Storm water, *Water quality control, Cost analysis, Flow, Sewage treatment, Cost sharing, Cost allocation, Evaluation, Urban hydrology, Waste water treatment.
Identifiers: N-person cooperative game theory.

An approach was developed for urban waste water management which integrates considerations for urban storm drainage, dry-weather sewage treatment, and wet-weather quality control. There has been a change from 'least-cost' to 'cost-effective' approaches and solutions. This approach presents procedures for formulation of control strategies and their cost evaluation. Integration of these evaluations would take advantage of overlap areas which could combine several functions, and procedures are also presented for this type of evaluation. The question of cost allocation was also considered and methods for cost determinations were presented. Concepts of cost sharing/cost allocation for evaluation of multipurpose plans were reviewed in light of the N-person cooperative game theory. (Collins-FIRL)
W77-07095

FACTORS INFLUENCING THE DEWATERING CHARACTERISTICS OF SLUDGE,
Clemson Univ., S. C.
P. R. Karr, III.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 77-652. PhD Thesis, 1976, 245 p.

Descriptors: Analysis, *Dewatering, Physical characteristics, *Sludge treatment, *Particle size, Sludge, Activated sludge, Anaerobic digestion, Biodegradation, Filtration, *Waste water treatment.
Identifiers: Dewatering characteristics, Capillary suction time, Blinding index.

Investigations were conducted to determine factors which influence sludge dewatering characteristics. Raw, activated, and anaerobically digested sludges were studied. Results confirmed that sludge particle size greatly affects dewatering characteristics, measured by specific resistance and capillary suction time (CST). This applied to sludges of all types. Other factors (pH, biological degradation, mixing, and conditioning) affected changes in dewaterability relative to their effects on particle size. Differences in dewatering characteristics were shown to be mainly affected by differences in particle size distributions. Supracolloidal solids in a range of 1 to 100 micrometers most affected dewatering characteristics. Particles of this size range blind sludge cake and filler medium during filtration and result in a large resistance to filtrate flow. A blinding index was developed. (Collins-FIRL)

RECYCLING OF ALUMINUM USED FOR PHOSPHATE REMOVAL IN DOMESTIC WASTE WATER TREATMENT,
Florida Univ., Gainesville.
D. A. Cornwell.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 77-140. PhD Thesis, 1975, 225 p.

Descriptors: Aluminum, *Sludge treatment, *Phosphorus, Domestic wastes, Separation techniques, *Phosphates, Coagulation, Extraction, Chemical treatment, Filtration, *Waste water treatment, *Recycling.
Identifiers: *Aluminum recycling, *Phosphate removal.

A process was developed for the economical recovery of aluminum used as a coagulant for phosphorus removal in domestic waste water treatment. Aluminum-phosphate-organic sludge was used. It was thickened to a solids concentration four times that of raw sludge, and reacted with sulfuric acid to dissolve the aluminum and phosphate. Sedimentation produced a 93% separation. The acidified aluminum was separated from the phosphate by a solvent extraction process using a kerosene solution of alkyl phosphates. The aluminum-rich kerosene phase was contacted with 6N H_2SO_4 and the kerosene:acid volume ratio was adjusted to form a final aluminum concentration equal to that in commercial alum (about 5%). Recovered aluminum was reused as a coagulant in phosphorus precipitation and the kerosene was recycled to the extraction stages. Overall recovery of aluminum was 89-93%. (Collins-FIRL)

ON-LINE ADAPTIVE CONTROL FOR COMBINED SEWER SYSTEMS,
Colorado State Univ., Fort Collins.
P. D. Trotta.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106. Order No. 77-1188. PhD Thesis, 1976. 224 p.

Descriptors: *Model studies, *Storm water, *Computer models, *Storm runoff, *Combined sewers, Interceptor sewers, Waste water treatment, Overflow, Planning, Automatic control.
Identifiers: Stochastic dynamic programming.

A new approach to the problem of urban storm water management was proposed. On-line computer control of the mechanical features of a combined sewer system was investigated. These controls would aid sewer systems effectively to contain combined flows during storms. A model was developed for a system divided into subbasins. Controls for each subbasin are derived separately using a stochastic dynamic programming formulation. An upper limit for releases is determined by a master control problem, which combines te separate basin situations and determines individual interceptor and treatment capacities. An autoregressive-transfer function model is used to forecast inflows, and can respond to new information on the storm event. A part of the proposed system for San Francisco was used as a test case. Results indicated that controls based on stochastic models were superior to deterministic forecasts. The model provided a superior distribution of overflows when such overflows were unavoidable. A reactive model which was tested was able to minimize total overflows to an even higher degree. (Collins-FIRL.)

BURNING WASTE CHLORINATED HYDROCARBONS IN A CEMENT KILN,
St. Lawrence Cement Co., Mississauga, (Ontario).
L. P. MacDonald, D. J. Skinner, F. J. Hopton, and G. H. Thomas.
Technology Development Report, EPS 4-WP-77-2, Environmental Protection Service, Fisheries and Environment Canada, Ottawa, Canada, March, 1977, 223 p., 31 fig., 66 tab, 28 ref, 9 append.

Descriptors: Burning, *Waste disposal, *Polychlorinated biphenyls, Chlorinated hydrocarbons, Toxicity, Disposal, Cements, Model studies, Persistence, Degradation, Safety, *Waste treatment, *Incineration, Air pollution, Pollutant identification, Canada.
Identifiers: Kilns(Cement).

An experimental program was carried out in 1975/76 at the St. Lawrence Cement Co., in which waste chlorinated hydrocarbons, containing up to about 46 weight percent chlorine, were burned in a rotary cement kiln. The chlorinated hydrocarbons were burned in three distinct phases of increasing difficulty of combustion. Materials burned included mixtures of ethylene dichloride, chlorotoluene and up to approximately 50 percent polychlorinated biphenyls (PCB). These materials were destroyed in the cement kiln with at least 99.98 percent efficiency in all cases. Emissions of high molecular weight chlorinated hydrocarbons were not detected. Three light chlorinated hydrocarbons, dichloromethane, chloroform and carbon tetrachloride, were found in the emissions in the part per billion or lower range. The quantity of precipitator dust requiring disposal, as well as emissions of particulate matter, increased during the test. The chlorine input from the chlorinated hydrocarbon waste was up to about 0.8 weight percent relative to clinker and this effectively reduced the alkali concentration of the clinker in direct stoichiometric proportion. A reduction in fossil fuels used while burning chlorinated hydrocarbons was noted. (WATDOC)

WATER QUALITY MANAGEMENT AND THE DISTRIBUTION OF EMISSION RIGHTS BY SEALED TENDER MARKETS,
Geological Survey, Reston, Va. Water Resources Div.
E. D. Attanasi.
In: North-Holland TIMS Studies in the Management Sciences, Vol 3, p 113-123, 1976: North-Holland Publishing Company, New York 1976. 1 fig, 16 ref.

Descriptors: *Water quality control, *Industrial wastes, *Effluents, *Economic efficiency, Economic justification, Evaluation, Cost repayment, Water pollution, Planning.
Identifiers: Decision theory.

Economic analysis of water quality management has primarily dealt with industrial response and consequences of imposing effluent standards or changes on industrial wastes. Several writers have suggested that the River Basin Authority set a level of water quality and utilize simulated auctions to generate data which could be used set effluent charges. However, this paper investigates the possibilities of utilizing sealed tender markets for actual allocation of assimilative capacity through effluent emission rights. The paper analytically models the firm's decision process and response to alternative regulatory policies. It is from this perspective of policy analysis that certain control instruments are shown to result in inferior performance in terms of the potential effects on firm pricing decisions. (Woodard-USGS)

APPARATUS FOR DISPOSAL OF EFFLUENTS.
United States Patent 4,008,155. Issued February 15, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 3, p 935, February, 1977. 1 fig.

Descriptors: *Patents, *Waste disposal, *Separation techniques, Equipment, Surface waters, Pollutants, Water quality control, Water pollution control, Pollutants, Pollution abatement, Flotation.

A patent was issued for an apparatus to handle effluent disposal. The equipment is composed of two major enclosures, one within the other, and has a means for flotation on the open sea. The second chamber includes a centrally located open-bottom chamber. The second enclosure has a closed bottom for the accumulation of material separated from the treated effluent transferred to it from the

first enclosure. The bottom of the second enclosure has tapered chambers arranged side-by-side with walls that diverge upward so that material which is denser than water is separated from the remainder of the waste. (Collins-FIRL)

SUBSURFACE INJECTION-HOW MUCH DOES IT COST,
Black and Veatch, Denver, Colo.
C. P. Houck, and J. L. Smith.
Water and Wastes Engineering, Vol. 14, No. 1, p 35-42, January, 1977. 1 fig, 13 tab.

Descriptors: *Decision making, *Sludge disposal, *Costs, Treatment facilities, Underground waste disposal, Analysis, Planning, Waste water treatment, Sewage disposal, Ultimate disposal, *Injection.
Identifiers: *Subsurface injection, Land applications.

The cost considerations involved in subsurface injection are explored. The decision to use a land application system for sludge disposal may be either dependent or independent of in-plant sludge stabilization and handling costs. Sludge-associated costs are in-plant stabilization costs; transportation costs from plant to disposal site; and costs for subsurface injection. There are various points where these costs may merge. Other factors concerned are land area needs based on sludge quantities which, with plant size, influence costs; land preparation costs; and system hardware costs. Examples were given for calculating costs involved in the decision process. (Collins-FIRL)

ACID SOLUBILIZATION OF SEWAGE SLUDGE AND ASH CONSTITUENTS FOR POSSIBLE RECOVERY,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Oliver, and J. H. Carey.
Water Research, Vol. 10, No. 12, p 1077-1081, 1976. 3 fig, 2 tab, 15 ref.

Descriptors: *Heavy metals, *Activated sludge, *Acids, *Sludge disposal, *Sludge digestion, Sludge treatment, Treatment facilities, Leachates, Resources, Incineration, Waste water treatment, Sewage disposal, Temperature, *Sewage sludge, Solubility.
Identifiers: *Acid solubilization.

The disposal of sludge incineration matter has posed a potential hazard, since its ash contains some heavy metals which are leachable. An investigation was done to determine the possibility of using acid solubilization of sludge and ash constituents to reduce the problem. Digested sludge samples were collected from eight southern Ontario activated sludge treatment facilities. A procedure was adopted, based on data from the samples, for acid extraction of sludges. H2SO4 or HCl was added to lower sludge pH to 1.5, and solids were then separated from the leachate by vacuum filtration. The residue was rinsed with an equal volume of water to restore a normal pH and the solids could be disposed on agricultural land. Leachate can be processed for recovery of valuable components. Testing revealed that toxic trace metals recovery from wet sludges does not seem economically viable. Other studies showed that soil bacteria, especially under aerobic conditions, release high percentages of heavy metals in digested sludge when applied to agricultural land. Removal and recovery of metals and phosphates from sludge incinerator ash was not proven economically attractive. Investigations on the effect of incineration parameters on leachability of ash components is needed because temperature in this process has a great effect on leachability of ash metals. (Collins-FIRL)
W77-07017

FLUOSOLIDS INCINERATOR COMMISSIONED AT ESHER,
Water Services, Vol. 80, No. 970, p 753-754, December, 1976.

Descriptors: *Treatment facilities, *Incineration, *Sludge disposal, Sludge treatment, Solid wastes, Ultimate disposal, Sedimentation, Filters, Biological treatment, Dewatering, Lime, Oxygen, Gases, *Waste treatment, Organic matter.
Identifiers: Copperas, Sulfur dioxide, *Fluosolids.

Operational aspects of the fluosolids incinerator at Esher, England, were reviewed. The plant was designed to cope with the ultimate disposal of sludge residue from treatment plants by employing incineration. The process includes a mechanically raked screen, detritor, primary sedimentation, biological filters, humus tanks, microstrainers, and sludge incineration. After thickening, conditioning by lime and copperas, and dewatering by coilfilters, the coilfilter sludge cake is fed to the fluosolids system for incineration. The sludge cake is mixed within the hot sand bed to evaporate the water content and the organic components react with oxygen in the fluidizing air to achieve complete combustion with a minimum of excess oxygen at minimum temperatures. Exit gases pass through a heat exchanger and then to a venturi scrubber with a multitray cooling section. This removes solids/particulate matter from the gas stream and adds alkali for maximum SO2 removal. Water droplets with particulate solids are removed from the gas stream in a vane separator. The fluosolids reactor operates at a temperature of 620 C. Minimal heat losses rom the refractory lined shell and the heat reservoir of the sand bed allow a short reheating time after shut down periods. The incinerators can be shut down instantly without harm or a need for quench water or cooling air maintenance. The reactor has no moving parts. (Collins-FIRL)

SLUDGE INCINERATION AT ESHER.
Effluent and Water Treatment Journal, Vol. 16, No. 11, p 559-560, November, 1976.

Descriptors: *Incinerators, *Treatment facilities, *Sludge treatment, Equipment, Costs, Water utilization, Evaluation, Performance, Water reuse, *Waste treatment.
Identifiers: Esher(England).

A new Fluosolids sludge incineration plant has become operational in Esher, England. The plant, now serving a population of 70,560 with a treatment capacity of 1,000 kg/hour, is capable of handling 200,000/hour, if necessary. There is no odor with this method and the sludge is reduced to a fine inert ash. After thickening, the sludge is treated with lime and copperas and transferred to coil filters for dewatering. A sludge cake is formed which can be discharged for transportation or fed into a three section reactor for incineration. Interlocking fail safe systems are provided. (Collins-FIRL)

THE REMOVAL OF ORGANIC MATTER FROM WATER SUPPLIES BY ION EXCHANGE,
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
C. Anderson, and J. Maier.
Available from the National Technical Information Center, Springfield, VA 22161 as PB-266 022, Price Code: A04 in paper copy, A01 in microfiche. Minnesota Water Resources Research Center, Bulletin No. 91, University of Minnesota, Feb. 1977. 49 p, 16 fig, 16 tab, 38 ref. OWRT A-030-Minn(3).

Descriptors: *Organic matter, Pollutants, *Water pollution treatment, Carbon, *Anion exchange, *Waste water treatment, *Water treatment, Treatment facilities, Potable water, Design criteria, Resins.

This study was initiated to provide quantitative information on the use of anion exchange resins for organic removal. The organics that are present in surface water waters which currently pass through conventional treatment could be removed by anion exchange with the use of strongly basic anion exchange columns. The organics were removed to the lower limits of detection of the total organic carbon analysis with the use of the high porosity

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

strongly basic resins. These resins were also easily regenerated with the use of sodium chloride. The selectivity and kinetics of the chloride versus organic exchange process was briefly investigated. The reason being that this is a new approach to this problem and no data was available in the literature to provide information which could be used for preliminary design of a full scale treatment plant. A preliminary plant design showed that the process would be economically feasible and competitive with alternate methods of organic removal, assuming that they would also be as effective at organic removal as ion exchange. So, ion exchange could prove to be an effective, reliable and economical method to provide for the removal of organics for drinking water. (Waelti-Minnesota)

MIXING AND CIRCULATION OF LAKES AND RESERVOIRS WITH AIR PLUMES,
New Hampshire Univ. Durham. Dept. of Chemical Engineering.
R. S. Torrest, and J. Wen.
Available from the National Technical Information Service, Springfield, VA as PB-265 909, Price codes: A07 in paper copy, A01 in microfiche. New Hampshire Water Resources Research Center, Durham, Research Report No. 13, (1976). 128 p, 2 tab, 51 fig, 92 ref, append. OWRT A-030-NH(2).

Descriptors: *Self purification, Absorption, Domestic water, Stratification, *Aeration, *Mixing, *Circulation, Eutrophication, Lakes, Reservoirs, Velocity profiles, *Dissolved oxygen, Mass transfer, Design, Currents(Water), Model studies.
Identifiers: *Air plumes, Surface currents.

Aeration of lakes and reservoirs to control eutrophication and improve water quality is widespread. However, there are few guidelines to aid in design of the aeration treatment. Here relevant fluid mechanics literature is first summarized to show that the nature of the flow of water entrained by air bubbles rising from manifolds and point sources may be well described. Experimental studies of the resulting surface flows supplement and extend previous work. Surface velocity decay is described and, for manifold ration, the circulation cell size is shown to be about four times the water depth on each side of the manifold. Detailed measurements of velocity profiles are presented for a wide range of aeration rates in channels to 1 1/2 feet wide, 4 feet high and 12 feet long. The influence of aerator design and depth is illustrated, as is the variation of circulation efficiency with aeration rate. Similar results for 'point source' aeration to 9 scfm are described. Circulation due to water injection from a manifold (i.e., jet injection) is compared with that due to aeration. Measurements of the time variation of dissolved oxygen within the primary circulation are well described by a simple mathematical model with the single parameter, the time constant, a function of aeration rate. These results should aid in the overall design of aeration treatments since the characteristics of aeration induced circulation and the resulting dissolved oxygen variation can be estimated for systems of interest.

AN EXECUTIVE SUMMARY OF THREE EPA DEMONSTRATION PROGRAMS IN EROSION AND SEDIMENT CONTROL,
Hittman Associates, Inc., Columbia, Md.
B. C. Becker, M. A. Nawrocki, and G. M. Sitek.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-239 333, Price codes: MF A01 in microfiche. Environmental Protection Agency Report No. EPA-660/2-74-073, Washington, D.C., June 1974. 58 p, 7 fig, 1 tab, 2 ref. EPA 68-01-0743.

Descriptors: *Maryland, *Erosion control, *Sedimentation, *Storm water, *Demonstration watersheds, Aquatic environment, Construction, Rainfall-runoff relationships, Urbanization, Watersheds(Basins), Dredging, Sediment deposition, Filtering systems, Separation techniques, Biology, Channel morphology, Retention, Ponds.
Identifiers: Guidelines, Suspended solids separation, Pond dredging, Grade control.

This report presented the highlights of three recently completed programs in the area of sediment and erosion control. These programs were a 'Joint Construction Sediment Control Project,' a 'Programmed Demonstration for Erosion and Sediment Control Specialists,' and a 'Demonstration of the Separation and Disposal of Concentrated Sediments.' The first program demonstrated and developed guidelines for erosion and sediment control in urbanizing areas; the second program produced a series of 15 presentations on sediment and erosion control; and the third program consisted of a field demonstration of a system for removing and processing sediments from pond bottoms. DEBRIS BASINS FOR CONTROL OF SURFACE MINE SEDIMENTATION,
Kentucky Dept. for Natural Resources and Conservation, Frankfort. Office of Planning and Research.
L. R. Kimball.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 959, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report No. EPA-600/2-76-108, Cincinnati, Ohio, June 1976. 58 p, 13 fig, 11 tab, 7 ref, 1 append. EPA S801276.

Descriptors: *Sediment control, *Coal mine wastes, *Drainage, *Erosion control, *Kentucky, Feasibility studies, Demonstration watersheds, Sampling, Monitoring, Soils, Slopes, Water quality, Streamflow, Sedimentation.
Identifiers: *Surface mining, *Debris basins, Sediment ponds, Steep slope mining, Total solids.

This study reported on the feasibility of demonstrating the effectiveness of debris basins in controlling solids in water discharging from surface mine operations. Two sites in Eastern Kentucky were selected for study in areas where very little erosion-causing activity has occurred, and where surface mining is to be initiated. Adjacent 'virgin' watersheds were also selected for each study site to provide background data on water quality where man's activities have been very limited. Pertinent site information, including flow and water quality data, was gathered. This study indicated the necessity for conducting the demonstration and develops a recommended procedure. (Visocky-ISWS)

MEANS FOR PROTECTING THE DRINKING WATER QUALITY OF LAKE GEORGE, NEW YORK,
Rensselaer Polytechnic Inst., Troy, N.Y. Fresh Water Inst.
D. B. Aulenbach, and N. L. Clesceri.
Rensselaer Polytechnic Institute FWI Report 77-1, March 1977. 31 p., 5 fig., 3 tab., 28 ref.

Descriptors: *Water quality control, *Potable water, *Lakes, *Water pollution control, *New York, Sewage treatment, Recreation.
Identifiers: *Lake George(NY), Nutrient sources.

Homeowners around Lake George in the eastern Adirondack Mountains of New York State drink water directly from the lake with no treatment other than chlorination as required by state law. There are no restrictions on swimming, fishing, or boating other than those prohibiting waste discharges from boats. Probably the most important factor in maintaining the high quality of the waters is the lake's morphology. The narrow and deep lake has high ratio of hypolimnion-to-epilimnion which helps maintain oligotrophic conditions. Another significant factor is the relatively small drainage basin, approximately four times the total surface area of the lake. The low nutrient content of the surface soil and bed rock, and the probable uptake of nutrients by the forested areas help control nutrient inputs from tributary streams. In addition, there is active concern among all the users of the lake, both private and commercial. Phosphorus inputs have been eliminated by treatment plants which provide the equivalent of tertiary treatment to the two dense population centers; about 6% of the nitrogen entering the lake originates from the treatment plants' effluents. Habitations not readily accessible to sewers are served by septic tanks which are stringently monitored. (Auen-Wisconsin).

Eidgenoessische Anstalt fuer Wasservorsorgung, Abwasserreinigung und Gewaesserschutz, Kastienbaum (Switzerland). Marine Research Lab.
R. Cachter.
Hydrologie, Vol. 38, No. 1, p. 1-27, 1976. 9 fig., 5 tab., 23 ref.

Descriptors: *Siphons, *Nutrient removal, Phosphorus, Nitrogen, Trophic level, Eutrophication, Cycling nutrients, Hypolimnion, Sediments, Nitrogen cycle, Lakes.
Identifiers: *Lake restoration, Maunsee(Switzerland), Phosphorus loading.

The effects of an artificially increased nutrient export, using a hypolimnion siphon, on the trophic state of Mauensee, a relatively small, shallow, highly eutrophic lake in central Switzerland were investigated. It was concluded that: (1) It is possible to influence a shallow lake's trophic character by siphoning off part of its bottom water; (2) phosphorus became accumulted in the very top layer of sediments due to the yearly alternation of anoxic phosphorus release and aerobic phosphorus fixation; (3) the lakes's internal phosphorus cycle accelerated as more and more phosphorus became available in the top layer of sediments causing a self-maintaining auteutrophication of a lake as soon as the external nutrient loading reached a level favoring transiently anoxic conditions; (4) the lake's internal phosphorus loading of the trophogenic layer by sediments temporarily exceeded the external loading by more than a hundred-fold; (5) during the summer stagnation period, the phosphorus export exceeded the the external supply even without siphon; (6) the same was true for nitrogen during fall and winter overturn; (7) drastically increased nutrient export caused a nutrient reduction in the top sediment layer which decreased the back diffusion rate from the sediments to water; (8) siphoning will decrease primary production as long as the nutrient supply to the trophogenic layer is the rate limiting factor; and (9) siphoning led to an improvement of oxygen conditions in the hypolimnion. THE GENERATION OF RESIDUAL FLOWS IN NORWAY: AN INPUT-OUTPUT APPROACH,
Oslo Univ. (Norway). Inst. of Economics.
F. R. Forsund, and S. Strom.
Journal of Environmental Economics and Management, Vol. 3, No. 2, p. 129-141, 1976. 6 tab., 17 ref.

Descriptors: *Pollution abatement, *Input-output analysis, *Effluents, Economics, Foreign countries, Gross national product, National income, Consumptive use, Industries, Industrial wastes, Pulp and paper industry, Metals.
Identifiers: *Norway, Residuals.

Input-output analysis is used to study the generation of 35 different kinds of residuals for the Norwegian economy in 1970, where these residuals are treated as the joint products in consumption and production and the discharge to the air, land and water. The residuals are mercury, lead, cadmium, zinc, copper, iron, chrome, sulfur oxides, hydrochloric acid, nitrogen oxides, other acids, soda lye, other bases, fluorine, cyanide, arsenic, carbon monoxide, phosphorus compounds, nitrogen compounds, mine tailings/inorganic sludge/dust, pesticides, aliphatic halogenated hydrocarbons, bark, fiber, wood chips, plastic substances, dissolved biologically-decomposable organic substance, suspended biologically-decomposable substance, oil and oil products, dispersing agents, taste and smell-producing substances, substances with acute poisonous effects, organic solvents, other organic substances, and unspecified waste. Categories of final demand for each residual are enumerated for total export, government consumption, total gross fixed asset formation and total private consumption. A method is also derived for computing the cost of reducing discharges for each of the 35 residuals, given in cost coefficients for total supply per ton reduction of discharge. In the Norwegian 1970 economy, export, and especially export from the pulp and paper and metals and minerals sectors, was the main contributor of the flow of residuals. (Harris-Wisconsin)

POLLUTERS' PROFITS AND POLITICAL RESPONSE: DIRECT CONTROL VERSUS TAXES: COMMENTS AND REPLY,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for the Study of Public Choice.
J. M. Buchanan, and G. Tullock.
American Economic Review, Vol. 66, No. 5, p. 976-984, 1976. 8 ref.

Descriptors: *Pollution taxes(Charges), *Water pollution control, *Political constraints, Profit, Economics, Return(Monetary), Institutional constraints, Income.
Identifiers: *Pollution licenses.

Three reviews by environmental economists take issue with arguments raised in an earlier study which examined the political processes that led to the formulation of roles and regulations rather than taxes in the control of pollution. Whereas the original study postulated that because of regulation firms would be less than optimum size, one author argues that the regulated firms would be greater than optimum size and presents an analysis that shows firms engaging in transactions which increase profitability; this is in contrast to the earlier argument that firms are constrained to a less-than-maximum profits equilibrium. A second review claims that the explanation for the revealed preference of transactors for (equitable) direct controls (equal quotas of pollution production) lies in the probability that firms value the returns from taxes at less than the dollar amounts of paid taxes. A third review raises questions of methodology in regard to pollution control alternatives. The authors of the original study reply to the three reviewers, arguing that a quota scheme of pollution control, while not necessarily an efficient way to compensate for the problem, may represent the best politically viable alternative. (Harris-Wisconsin)

EFFLUENT CHARGES AND POLLUTION CONTROL: A CASE STUDY,
Royal Military Coll. of Canada, Kingston (Ontario). Dept. of Political and Economic Science.
G. Lepore.
Canadian Public Policy, Vol. II, No. 3, p. 482-491, 1976. 4 tab., 8 ref.

Descriptors: *Pollution taxes(Charges), *Water pollution control, Canada, Sulfur compounds, Estimation, Unit costs, Economics, Costs, Air pollution.

A study of the effects of pollution taxes as an instrument of environmental control argues that, aside from any other relevant considerations, a policy aimed at controlling pollution through such charges necessitates a prior knowledge of the approximate magnitude of the charges required. The study also proposes a method to estimate such magnitude, based on the derivation of cost curves of abatement for given pollutants. The estimation method assumes that many types of sources discharge any one pollutant and that the known cost of abatement per unit of pollutant is likely to be different for different sources. Therefore, by plotting cost per unit of pollutant abated against the overall reduction of pollutants, a cost function is obtained which can be used in the same manner as a true overall additional cost function. In fact, since estimates of costs usually come in the form of ranges, the result also will be an estimated range of maximum and minimum costs. The procedure was followed to estimate the minimum and maximum reduction of emissions of sulfur oxides by ten types of sources in nine industries. These industries are the source of about 75% of all emissions of sulfur oxides in Canada. (Harris-Wisconsin)

OPTIMAL OIL TANKER SIZE WITH REGARD TO ENVIRONMENTAL IMPACT OF OIL SPILLS,
California Univ., Los Angeles. Graduate School of Management.
R. K. Sarin, and C. R. Scherer.
Journal of Environmental Economics and Management, Vol. 3, No. 3, p. 226-235, 1976. 3 fig., 15 ref.

Descriptors: *Oil spills, Ships, *Environmental effects, *Model studies, *Optimization, Size, Water pollution sources, Oil industry, Navigation, Law of the sea, Accidents, Hazards, Harbors, Estimating scheduling, Economics, Pacific Ocean, Alaska.
Identifiers: *Oil tankers, Tradeoffs.

A model is examined which offers a probabilistic framework for investigating oil tanker size with regard to expected environmental impact of spills during accidental incidences along a coastal shipping route. The model was designed in anticipation of problems involving supertankers moving oil from Valdez, Alaska to west coast ports in the lower states. The model specifically examines tradeoffs between the local environmental impact of relatively small but frequent oil spills associated with the traffic of many small tankers, and the local environmental impact of large and relatively-infrequent spills with fewer tankers of larger size. Important relationships between tanker size, traffic density, number of accidents and spills and environmental impact are outlined and defined. A procedure is suggested to incorporate the environmental impact of oil spills in the model without quantifying them in monetary units. A closed-form solution set for optimal tanker size is obtained and some numerical results are presented. Within the model, separate expressions are developed to account for damages from three kinds of sources: (1) collision of a loaded tanker with another tanker or any other ship on the route or in harbor areas; (2) casualties enroute other than collision, e.g., grounding, fire, or structural failure of the loaded tanker; and (3) accidental releases during loading and unloading in port. Identifiers: *Santa Ana River basin(Calif), Production, Aggregation, Conflicting goals, Los Angeles(Cal), Welfare function maximization.

In determining public policy measures, the value of information about the functional relationships between targets and instruments can hardly be understated. In this paper, these macrorelations are obtained for a competitive industry by way of aggregation over many individual firms following simple behavioristic patterns. With the exact knowledge of the macrorelations, obtaining the numerical values of the instruments becomes a simple mathematical programming problem. These principles are applied in examination of the water pollution problems generated by the dairy industry in the Santa Ana River basin where local governments face the problem of controlling environmental quality with minimum opportunity costs in terms of output. Assuming the two conflicting goals--production level and environmental quality--and two policy instruments--regulation of waste disposal technologies and level of guaranteed credit to finance antipollution investments, a model is constructed to identify the impact of these controls on the individual microunits (firms). The microimpacts are then aggregated across firms to generate a tradeoff relationship at the macrolevel between production and environmental quality goals and to determine the relationship between each of the macrogoals and the two policy instruments. Thus, the regional policymaker can determine levels of the policy variables which will maximize a regional welfare function subject to the appropriate technological and financial constraints. Results indicate that a more efficient and flexible policy can maintain higher environmental quality while causing fewer firms to relocate. (Bell-Cornell)

USGS SCIENTISTS BRING CALIFORNIA WATER SUPPLY INTO COMPLIANCE WITH FEDERAL REGULATIONS,
Geological Survey, Laguna Niguel, Calif.
L. A. Eccles, J. M. Klein, and W. F. Hardt.
Water Well Journal, Vol. 31, No. 2, p 42-45, February, 1977. 3 fig.

Descriptors: *Nitrates, *Pollution abatement, Aquifers, Fertilizers, Water pollution sources, Well screens, Water wells, *California, Water quality standards.
Identifiers: *Redlands(Calif), *San Bernadino(Calif).

In January 1976, ground water investigators of the U.S. Geological Survey began working on a solution to a high nitrate problem in the Redlands, California (San Bernardino Valley) area where wells were yielding samples double the Safe Drinking Water Act recommendations of 10 mg/l. Many years of citrus growing and concomitant use of nitrogen fertilizer had contaminated the upper of two significant water-producing zones separated by a sandy-clay interval. The primary well under investigation was screened in both zones with the pump located in the upper, and produced water with nitrate-nitrogen concentration up to 20 mg/l. By installing an inflatable packer at the bottom of the contaminated zone and resetting the pump at greater depth, the nitrate-nitrogen concentration was reduced to a constant 4 mg/l with only a 25 percent decrease in well yield. Permanent sealing of perforations in the upper zone was recommended to maintain high-yield low nitrate performance of this well. Long-term pollution abatement practices suggested for this area include minimization of downward flow of water in the aquifer, avoidance of indiscriminate perforation of wells in all water bearing zones penetrated, and pumping several wells at lower rates rather than a single well at maximum rate. (Eberle-NWWA)

POLLUTION PREVENTION, NOT CONTROL CALLED KEY TO A CLEAN ENVIRONMENT.
Water Conditioning, Vol 18, No 11, p 9, January, 1977.

Descriptors: *Pollution abatement, *Water pollution, *Air pollution, Taxes, Costs, United Nations, Legislation.
Identifiers: *Pollution source control, Pollution control technology, Tax incentives.

A conservation approach to industrial pollution which stresses prevention over cure has been outlined during an environmental program of the United Nations' Economic Commission for Europe. In view of the esclating costs of pollution removal, the only economic alernative may be the design of processes and products which yield little or no contaminants to air or water. The 3M Company, of St. Paul, Minnesota has initiated such a program and in the nine months of its operation has eliminated waste at an annual rate of 70,000 tons of air pollutants and 500 million gallons of waste water. At the present time this type of pollution control has not received received recognition by governments or the general public. Consequently emphasis has been placed on the traditional removal type of pollution control technology. Tax incentives which provide for the traditional removal echniques do not serve the source control methods. Some regulations limit the percentage rather than the total amount of pollutants, this prohibits using echniques that reduce the amount of pollutants even though they increase the concentration. Problems of this nature can be reduced only if the technical aspects of pollution control can be recognized by governments as much as the legal and political aspects. (Heiss-NWWA)

THE LEGAL RESPONSIBILITY OF WATER WELL DRILLERS,
National Water Well Association, Worthington, Ohio.
H. W. Heiss.
Water Well Journal, Vol 31, No 2, p 39-40, February, 1977.

Descriptors: *Water pollution control, *Well regulations, Sewage bacteria, Water law, Water wells, Drilling, Legal aspects.
Identifiers: *Well construction, *Well contractor liability.

Recent hydrological developments making possible the accurate location of sources of ground water pollution, in addition to increased public awareness of water resource conservation and water rights, are placing today's well contractor in new positions of liability for contamination. If faulty casing or grouting procedures result in contamination from sewage bacteria or other chemical sources, the contractor may be liable to (1) the well owner (2) the owners of adjacent property whose wells have been contaminated due to the defective well, and (3) a state or local agency whose well construction regulations have been violated. Many perplexing questions concerning liability exist, e.g., responsibility for contamination in the event of a surface spill over a shallow aquifer, negligence of a well owner or housing developer, the reasonable length of time a well should provide trouble-free service, etc, Until such issues are resolved, the contractor's strict adherence to local codes and the use of approved materials is strongly recommended. The objective of the Marine Ecosystems Analysis (MESA) Program is to identify and measure the impact of man on the marine environment. This requires that we: (1) describe, understand, and monitor physical, geological, chemical, and biological processes of marine environmental systems in territorial, boundary, and international waters around the United States; (2) analyze impacts of natural phenomena or manmade alterations on marine environments; and (3) provide information and specialized support for the effective management of marine areas and for the rational use of their resources. Identifiers: *Menhaden, Bubbler system, *Submerged offshore diffuser, *Degassing techniques, Effluent dilution, Plant operating restrictions, *Pilgrim Nuclear Power Station(Mass).

The objective is to determine the feasibility and potential application of various fish diversion and deterrent techniques and power plant operational and discharge design modifications which would prevent or minimize the occurrence of gas bubble disease mortalities of menhaden at Pilgrim Nuclear Power Station. The specific alternatives considered in this report include: behavioral barriers, physical barriers, high current velocity barriers, a submerged offshore diffuser, degassing techniques, effluent dilution, plant operating restrictions, and the commercial harvest of menhaden. These alternatives were evaluated on the basis of the following criteria: system effectiveness, system cost, operating experience, design development requirements, applicability in discharge canal or thermal plume, regulatory acceptability, and potential environmental impacts (other than effects on adult menhaden). WHO'S MINDING THE SHORE. A CITIZENS' GUIDE TO COASTAL MANAGEMENT,
Natural Resources Defense Council, Inc., Palo Alto, Calif.
Report to NOAA, Office of Coastal Zone Management, August 1976. 56 p, 4 append.

Descriptors: *Planning, *Ecosystems, *Oil pollution, *Resources development, *Baseline studies, *Environmental effects, Land use, Coasts, Shore protection, Public rights.
Identifiers: *Coastal Zone Management, Public interest.

This handbook is designed to help citizens participate in their state's planning effort. The CZMA is described and states requirements are listed. A catalog of what people can do to become actively involved in the formulation of their state's program is given. The requirements an effective program must meet are considered and the natural forces at work in the coastal ecosystems and the areas which are vital to the preservation of these ecosystems are outlined. The various recreational, commercial, and industrial activities which compete for use of the coastal zone are described and some of the considerations which should be taken into account for their proper management are given. Two of the most acute development pressures in the coastal zone--offshore oil production and residential subdivisions--are considered with their problems for the design of a management program. Finally, an analysis of the rights of public and private owners of property in the coastal zone and the extent of state authority to regulate their use of property in the management program is given. CINCINNATI'S PREVENTIVE MAINTENANCE SEWER PROGRAM.
Water and Sewage Works, Vol. 124, No. 1, p 70-71, January, 1977.

Descriptors: *Sewerage, *Repairing, *Inspection, *Cleaning, *Maintenance, *Water districts, Cities, Personnel, Water quality control, Sanitary engineering, *Ohio.
Identifiers: *Cincinnati Metropolitan Sewer District(OH).

The Greater Cincinnati Sewer Maintenance Division will soon complete a 12-year program of preventive inspection and cleaning of its 4000-mile sewer system. The goal of the project is to provide repair and cleaning services before conditions warrant complaints. A complex network of crews was formed to achieve this goal. There are three cleaning and repair-section crews and an inspection section crew. Each cleaning/repair section has two major repair crews, a minor repair crew, two major cleaning crews, a power cleaning crew, and a complaint crew. The inspection and investigation section is composed of three minor investigation crews for interceptor cleaning; three regulator crews--two routine inspection crews and one maintenance crew for welding and fabrication; and four routine inspection crews. Other divisions of the Metropolitan Sewer District are Administration, Technical Services, and Operations. The entire operation is financed by a special rate charge. Daily reports are made on trouble areas, and monthly reports are given on how much sewer line was cleaned and repaired, on the number of complaints, and on recommended solutions. Equipment is serviced regularly and purchases are based on the amount of cleaning and repair work to be done. (Collins-FIRL)

NUTRIENT REMOVAL BY WATER HYACINTHS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
D. A. Cornwell, J. Zoltek, Jr., C. D. Patrinely, T. deS. Furman, and J. I. Kim.
Journal Water Pollution Control Federation, Vol 49, No 1, p 57-65, January, 1977. 5 fig, 4 tab, 15 ref.

Descriptors: *Nutrient removal, *Water hyacinth, *Waste water treatment, *Eutrophication, *Aquatic algae, *Biochemical oxygen demand, Nitrogen, Phosphorus, Water pollution effects, Water quality.

Hyacinths were studied as nutrient removal agents for use in combating eutrophication. Experiments on effluent from the University of Florida Waste Water Treatment Plant (Gainesville) were conducted in a 3-phase study to determine if there was a significant reduction of nitrogen and phosphorus in a plant scale operation during winter, to determine growth patterns and effectiveness, and to study effects of detention time and depth. Resultant data showed that water hyacinths' nutrient removal capacities were directly related to pond surface area; that depth and detention time must allow a given surface area per unit flow through the pond (80% nitrogen and 44% phosphorus removal were gained with 5.1 acres hyacinths per 1 mgd); and that nutrient uptake was good during the increase in area-growth phase and during the vertical-growth phase. The nitrogen removal factor may make the plants useful in eutrophication control. Nutrients which sloughed off during the death phase remained in ponds as a bottom sediment and reduced the need for hyacinth harvesting. The most profitable use of the dead hyacinths would be as compost. (Collins-FIRL)

WHAT'S NEW IN LANDFILL LINERS.
The American City and County, Vol 92, No 2, p 54-56, February, 1977. 2 tab.

Descriptors: *Linings, *Landfills, *Water pollution control, Groundwater, Surface waters, Plastics, Asphalts, Cements, Rubber, Impervious membranes, Adhesives, Films, Polymers, Leachates, Economics, Oxidation, Temperatures, Anaerobic conditions, Environment.

Landfill linings have been used to control ground and surface water pollution resulting from landfill operations. Linings suitable for the disposal of various fluids or wastes were described. These include polyethylene (PE), plasticized polyvinyl chloride (PVC), butyl rubber sheeting, chlorosulfonated polyethylene sheeting (Hypalon), ethylene propylene rubber (EPDM), chlorinated polyethylene (CPE), admix liners, asphalt concrete, hydraulic asphalt concrete, soil asphalt, bituminous seal-catalytically blown asphalt, and bituminous seal-fabric plus asphalt emulsion. Selection often depends upon the economics of usage and the length of time the liner will be in service. Combinations of linings are sometimes preferable to single ones. Seaming is important with liners because they are usually manufactured in narrow sheets. Factory seaming usually employs electronic sealing, 'solvent welding', or heat curing adhesives. The use of adhesives is restricted by the specific polymer and specific compounding recipe for which they are designed. Environmental conditions often affect the usefulness of these liners. Anaerobic conditions, normally found at the bottom of landfills, prevent oxidation of liner materials. The liners should be placed on surfaces graded to allow drainage; objects that could cause cracking of hard liners should be removed. Polymeric materials should be protected from light which degrades the materials. Wet-humid conditions should be reduced, especially when leachate is regularly produced, to prevent leaching from a liner, and temperatures should be in the 40-70 F range. Acidic conditions and high leachate ion concentrations should also be avoided. (Collins-FIRL)

PHOSPHATES IN SOILS TREATED WITH SEWAGE WATER: I. GENERAL INFORMATION ON SEWAGE FARM, SOIL, AND TREATMENT RESULTS,
Agricultural Univ., Wageningen (Netherlands).
J. Beek, F. A. M. de Haan, and W. H. van Riemsdijk.
Journal of Environmental Quality, Vol 6, No 1, p 4-7, January-March, 1977. 1 fig, 3 tab, 7 ref.

Descriptors: *Phosphates, *Soils, *Sewage treatment, Sewage effluents, Sewage disposal, Organic matter, Inorganic compounds, Biochemical oxygen demand, *Waste water treatment, Waste water disposal.
Identifiers: Sewage farms.

Research conducted at a sewage farm used for 50 years was described. The 247 acre area was reclaimed from uncultivated woodland on sandy soil. A comparison of the composition of the added waste water and the drainage water can be indicative of the effectiveness of this treatment method. Water analysis results can be supported with soil analysis data. Analysis of sodium, potassium, cadmium, manganese, silica dioxide, iron, and chlorine did not reveal any significant differences, indicating a degree of soil system equilibrium relative to these compounds. Data indicated that the soil is an active filter for organic carbon compounds, as well as for organic and inorganic phosphorus compounds. These and other collected data showed land disposal of raw sewage water is still effective in reducing BOD and removing phosphates, even after 45 years of use. The use of this land as permanent pasture can be combined with waste water treatment up to a waste water level thickness of 2.5 meters on an annual basis. This treatment raises soil pH and increases organic matter content. Nitrogenous compounds are transformed into nitrate nitrogen and nitrogen removal by soil treatment is relatively low. Both adsorption and precipitation reactions play a role in phosphate bonding by soil and phosphate accumulation is mostly limited to the top 50 centimeters. DEVICE FOR SUCKING THE UPPER LAYER OF A POLLUTED WATER SURFACE,
L. Chastan-Bagnis.
United States Patent 4,008,156. Issued February 15, 1977. Official Gazette of the United States Patent Office, Vol. 955, No. 3, p 935, February, 1977. 1 fig.

Descriptors: *Patents, Equipment, *Separation techniques, *Specific gravity, Separation, Water pollution control, Surface waters, Pollutants, Water quality control, Pollution abatement.

A patent was issued for a device to collect floating pollutants from water surfaces. The mechanism has an inlet opening in the forward portion connected to a channel with extending sidewalls so that polluted water flows through the channel from the inlet opening. A collection chamber is provided with means to separate the polluting material according to their specific gravities. A negative pressure area sucks the pollutant into the collection chamber and means are provided to remove separated water and pollutants from the collection chamber. (Collins-FIRL)

INDICES OF WATER RESTRICTION AND WATER DEFICIENCY TOLERANCE,
Research Inst. for Water Resources Development, Budapest (Hungary).
I. Domokos.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 865-875. 4 fig, 10 ref.

Descriptors: *Water resources development, Water demand, Planning, Management, Stochastic processes, Evaluation, Equations, Constraints, Systems analysis.
Identifiers: *Water restriction indices, *Water deficiency.

One of the groups of limiting conditions serving as a basis of planning of water development systems is that of the limit values of the indices characterizing the restriction in satisfying water demands, i.e., by the so-called water deficiency tolerance indices. A general theory of water restriction indices has been developed. First some properties of the time functions of the available water resources and of the water demands are analyzed or prescribed, respectively, as well as some properties of the periods considered, all of which can be of use for the construction of the theory. Then the concept of the water restriction index is defined as the expected value of this indicator function considered as a stochastic process. Three particular concrete water restriction indices incorporated in this theory are discussed. These are: the relative duration of water restriction surpassing a certain degree; the average relative water deficiency and the mean square relative deficiency. Simple formulae are reduced for the calculation of these indices. Their applicability in the practice of water resources management is also appraised. (See also W77-06708) (Bell-Cornell)

A SECTOR MODEL FOR REGIONAL AND NATIONAL WATER RESOURCES PLANNING,
Harvard Univ., Cambridge, Mass. Center for Population Studies.
P. Rogers.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2. IAHS/Unesco, Paris, France, 1974, p 1040-1047. 3 fig, 1 tab, 17 ref.

Descriptors: Water resources, *Long-term planning, *Regional development, *Evaluation, *Scheduling, *Investment, *Economics, Water policy, Decision making, Agriculture, Constraints, Input-output analysis, Project planning, Methodology, Mathematical models, Systems analysis, Optimization, Linear programming.
Identifiers: *Multi-level sector model, Mixed-integer programming, Intersectoral planning, Benefit functions, Benefit maximization, Government decision model, Producer decision model, East Pakistan.

A multi-level sector model is proposed to evaluate the selection of optimal schedules from all possible investments in the water sector of an economy by regions and over time. The interregional and intertemporal nature of the model allows for the evaluation of policy decisions concerning preferred regional growth and balance. An example based on planning for the use of water for agricultural development in the Province of East Pakistan is discussed. Although the model is of only the water sector, the constraints upon it relate it to intersectoral input-output models of the regional and national economy. The crux of the intersectoral planning problem is to be able to set the size of the resource allocation to each of the sectors. The model focuses on the investment decision within the sector itself rather than between the sectors. The overall model is split into two separate but complementary models, called the Governmental Decision Model and the Producer Decision Model; the former utilizes mixed-integer programming and the latter employs continuous linear programming. A summary comparison between the two models is given; the objective of both is benefit maximization. (See also W77-06708) (Bell-Cornell)

This paper studies the current status of water resources management through System Science. Having given some basic definitions, the necessity is shown of facing the problem of rational water resources management through active interdisciplinary research which could avoid fragmented and distorted points of view and which could state the problem within the more general framework of territorial management and economic programming. The methodology of approach through System Science is described, its different phases are analyzed, and finally some conclusions are drawn on the basis of the applications already implemented. Identifiers: *General equilibrium analysis, Western US, Benefit maximization, Activity analysis model, Basic programming model, Shadow prices, Cropping pattern.

Market forces have failed in the area of development, allocation and management of natural resources in general and of water resources in particular. The shaping of public investment programs for water resources development has long been dominated by partial equilibrium analyses such as 'benefit cost' analysis (B/C). However, this approach is rather limited for an interregional intertemporal management program of water resources. This study offers a multisector planning and management approach for water resources based on a general equilibrium analysis employing input-output models and linear programming techniques. A dynamic multisector programming model which accounts for the sectoral, spatial, and temporal aspects of regional planning is formulated and applied empirically for California and the western U.S. for a 15-year planning horizon. The objective of this basic model is to maximize the gross intertemporal interregional product up to the target year and from then on to infinity. An extension to an activity analysis model of various types of water production activities is offered to provide a choice among alternative development projects; the objective of this model is maximization of consumption. Results of the empirical application pertain to water requirements forecasts, interregional water transfer requirements, efficient production and cropping pattern, 'shadow prices' for water and labor and an optimal investment program for water resources projects. Use of this model has enabled the investigation of regional development dependent upon the interrelationships between resource availabilities and sectoral planning, illustrating complex interdependencies among economic variables. Identifiers: Resource analysis, Public planning.

The scope, scale and content of comprehensive information systems for urban environmental resource management are a function of several varibles including the purpose and scope of the management study, scale and specificity of the applications level of complexity of the analysis method, and the objective of the planning program. These affect the organizational structure and content of the information system as it is designed for a particular application, whether that application is a tailored solution to a specific resource problem or whether it is a general course of action to be followed in future urban area development. In any urban application, a systematically structured information system should be developed that includes the full range of parameters associated with the urban system as well as the environmental system. A particular need exists for more thorough consideration of social factors and a descriptive framework is presented for incorporation of these factors. This research also addresses the relationship of form and content of information systems to the methods and techniques of analysis used and the influence of urban area planning approaches on the structure, content and use of information inputs. The current status of water resource planning is reviewed, indicating the need for a general process that incorporates the operational frame of resource management in the more comprehensively organized, public decision-making frame of urban land use planning. A two-stage process for management planning is developed. The process provides for the formulation, design, and implementation of an integrated management program through a series of progressively dependent activity phases. The definition stage is directed to the objective determination of problems along with a preliminary assessment of management needs to provide the basis for the specification by the public involved of the management objectives. This stage is accomplished through a three-phase program formulation, area-wide inventory and analysis, and public definition of management objectives. In the second stage, management alernatives to the stated objectives are defined and evaluated, the management program is selected and implemented, and procedures for continuing public and technical review are instituted. Technical involvement during the management stage is likely to be significantly greater than in the definition stage because extensive programs of data collection and the application of more sophisticated techniques of systems analysis and program evaluation are more likely to be required.

IMPROVEMENT OF PLANNING FOR POST DEVELOPMENT WATER RESOURCE MANAGEMENT: A STUDY OF THE WEBER BASIN PROJECT,
Utah State Univ., Logan. Inst. for Social Science Research on Natural Research.
G. E. Madsen, and W. H. Andrews.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 009, Price codes: A05 in paper copy, A01 in microfiche. Research Monograph No. 6, September 1976. 90 p, 1 fig, 6 tab, 53 ref. OWRT C-6092(No. 5212)(1), 14-31-0001-5212.

Descriptors: *Management, *Planning, Social impacts, Social change, *Utah, River basin development, Water resources development, Post-impoundment, Water management(Applied), Future planning(Projected), Water demand, Recreation, Urbanization, Irrigation systems, Attitudes.
Identifiers: *Weber Basin Project(Utah).

The objectives of this research were: (1) identify present management problems in the Weber Basin Project of Utah; (2) identify whether the problems are related to the planning process so that relationships between planning and management can be identified; (3) identify recommendations from present management personnel concerning changes in planning which might help alleviate management problems with future projects, as well as recommendations for present solutions to problems; (4) identify theoretical elements which can be applied to future planning. Data for the study came from three sources: indepth interviews with officials representing management agencies in the Weber Basin Project; secondary data from organizational records, previous research studies, and planning documents; and two seminars with management officials. Present management problems were being experienced primarily in two areas, urban pressurized irrigation systems (where the non-treated water is used for residential lawns, gardens and shrubs), and the recreation component of the project. Several recommendations for future water resources planning grew out of this project. Two of the most important were: (1) many of the present problems are related to changes in the project which occurred largely since the initial planning and development. Therefore, it appears that more emphasis needs to be given to a broad program of continuous planning through the lifetime of future projects; (2) it would be helpful to have periodic meetings at the early stages of the project and continue them through the operation.

OPEN SPACE AND URBAN WATER MANAGEMENT - PHASE II: CASE STUDIES AND FINDINGS,
North Carolina Univ. at Chapel. Dept. of City and Regional Planning.
K. Elfers, and M. M. Hufschmidt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 087, Price codes: A07 in paper copy, A01 in microfiche. North Carolina Water Resources Research Institute, Raleigh, Report No. 122, December 1976. 225 p, 5 fig, 1 tab, 153 ref. OWRT B-086-NC(1). 14-31-000-5101.

Descriptors: *Urban hydrology, *Land use, Water resources, Water management(Applied), Ecosystems, Preservation, Urban runoff, *Planning, North Carolina, Urban drainage, Small watersheds, *Management, *Watershed management, Southeast US, Water quality.
Identifiers: *Urban water management, *Open spaces preservation, Urban water resources, *Crabtree Creek watershed(NC), *Eno River watershed(NC), Raleigh area(NC), Durham area(NC), *Piedmont region(NC).

A detailed examination was made of local goals, criteria, and planning strategies for the preservation of open space and the related management of urban water resources. The key elements are two extensive case studies of small, urbanizing watersheds in the Piedmont Region of North Carolina. The two watersheds offer good examples of the diverse problems, issues, goals, and criteria that may be involved in open space preservation and related urban water management. Crabtree Creek watershed, near and including part of Raleigh, N.C., offers a case study in which (1) several City and County agencies have been involved in open space and related urban water management activities, (2) the State is expanding a major State Park, (3) the SCS is helping to implement a system of flood control impoundments, (4) the EPA is reviewing the probable impacts of a proposed major sewer interceptor, and (5) the Corps of Engineers and the Bureau of Outdoor Recreation are studying alternative flood control/recreation plans for the main stem of the Crabtree Creek within Raleigh. The Eno River watershed near Durham, N.C., offers an important contrast in that the watershed is more rural and scenic with steep valleys and narrow floodplains. Thus, interest has focused on preserving much of the river valley in its natural state and on creating a State Park. The recommendations fall into two basic categories: (1) those of a planning strategy or procedural nature which would be applicable to all areas of the country; and (2) those consisting of planning criteria and standards of a quantitative nature which, although expressed in terms of acceptable ranges of values, are directed toward the Piedmont Region of the southeastern United States. A NEW RESERVOIR AND RECREATIONAL BEHAVIOR,
Oklahoma State Univ., Stillwater. Dept. of Geography.
R. D. Hecock.
Growth and Change, Vol. 5, No. 3, July 1974, p 17-20. 3 fig, 3 tab.

Descriptors: *Recreation, *Reservoirs, Behavior, *Social impact, Surveys, Water resource development, Benefits, *Oklahoma, Attitudes, Estimating, Land use.
Identifiers: *Keystone Reservoir(OK), *Recreation participation rates, Land and Water Conservation Act, Public access.

Estimating the nature and extent of a new reservoir's impact on the recreational behavior of the population surrounding the reservoir is discussed. Recreational benefits of federal reservoirs are currently calculated on predictions of gross attendance. But distortions occur because projected attendance will be greatest where there is presently a large participating population, and where there is multiple counting of active participants. It is necessary to understand how participation is developed in an area previously without any access to water resource recreation. The Keystone Reservoir, in northwest Oklahoma, completed in 1964 and containing 26,000 acres of water surface, was used as a case study. Surveys were taken between 1960 and 1970. Thirty-five percent of outdoor recreationists said Keystone stimulated a change in their recreation behavior; 25% of total respondents indicated the lake influenced their recreation behavior. In both groups about 40% reported increases in recreation participation rates, while 30% reported unchanged participation rates. The data suggest a steep distance-decay function exists, explaining a strong reverse relationship between distance from the reservoir and the proportion of respondents whose recreation behavior was influenced by Keystone. Conclusions are that different types and locations of facilities will result if emphasis on gross participation rates is reduced, and increased weight is given to rates of non-participation. Several smaller reservoirs would have a larger impact on recreation behavior than one large reservoir due to the high degree of localization of impact on recreation behavior. (Gentry-North Carolina)

COLLECTIVE UTILITY: A SYSTEMS APPROACH TO WATER PRICING POLICY,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
L. Duckstein, and C. C. Kisiel.
In: Mathematical Models in Hydrology, Proceedings of the Warsaw Symposium, Poland, July 1971, Volume 2, IAHS/Unesco, Paris, France, 1974, p 879-886. 1 tab, 11 ref. OWRT A-024-ARIZ(10).

Descriptors: *Water policy, *Pricing, Water distribution(Policy), Assessment, Water rates, Regions, Arizona, Equations, Mathematical models, Cost-benefit analysis, Conservation, Behavior, Systems analysis, Methodology.
Identifiers: *Collective utility, Tucson(Arizona), Comparison.

Collective utility of a region based on Lesourne's theory is used to compare water pricing policies in Tucson, Arizona over a single time period. The present method of marginal pricing (regressive block rate) is compared to a hypothetical conservation pricing (progressive block rate). Well-defined hypotheses are made about the behavior of consumers served by the water distribution company. The value of the change in collective utility determines which price structure should be adopted once model parameters are known and once a value has been inputed to conservation. A progressive rate structure decreases the total consumption. When peak consumption is lowered, lower capital expenditures occur. Extensions of the model to multi-period policies and uncertainty of future conditions are presented. The analysis is appropriate wherever a central water agency exists. Collective utility as an approach to analysis of water resource systems is contrasted with the techniques of cost-effectiveness and cost-benefit analyses. Although a progressive price structure goes against the established principle of 'marginal pricing' (the more water is produced, the cheaper it is sold), preliminary calculations show that a permanent change to such a structure increases the collective utility. The collective utility approach can be used for sequential decision making on price structures. (See also W77-06708) (Bell-Cornell)

THE GROWTH SHAPERS: THE LAND USE IMPACTS OF INFRASTRUCTURE INVESTMENTS.
Urban Systems Research and Engineering, Inc., Cambridge, Mass.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $1.30. Prepared for the Council on Environmental Quality, Washington, D.C., May 1976. 71 p, 44 fig, 37 ref, 1 append.

Descriptors: *Environmental effects, *Land use, *Capital investment, *Sewers, *Highways, *Land development, *Land management, *Land resources, Investment, Airport, Social aspects.
Identifiers: *Infrastructure, *Public investment, Economic aspects, Mass transit.

The link between infrastructure facilities such as water and wastewater systems, power supplies, highway and road networks, mass transit systems and airports, and land use is explored. Focusing on how infrastructure investments can shift existing or potential demand for land, there is, however, no agreement on the question as to whether infrastructure investment actually creates growth or merely concentrates a region's development into its own service area. Steps to estimate what development will occur for a given investment are: (1) define the impact area; (2) inventory the supply of land in an area; (3) estimate demand for land; (4) use supply and demand analysis to determine what development will occur; (5) estimate impacts of the amount, pattern, and rate of development; and (6) determine how the impacts, related to the investment, can then be controlled. Impacts of infrastructure induced development may be controlled by reduction in capacity of the infrastructure, thereby limiting demand; changing the route of the infrastructure investment; staging the investment in phases; zoning (including cluster zoning, density zoning and planned unit development); public purchase of land rights (i.e., land banking). Regulations setting performance standards for environmental management and building codes can be used to control subdivision development and construction. Detailed analysis, using the above methodology, is presented for highways, mass transit, and sewers. (Gentry-NC)

M. D. Bradley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 023, Price codes: A08 in paper copy, A01 in microfiche. Completion Report, (1976). 161 p, 4 fig, 69 ref. OWRT C-5222(No. 4213)(2).

Descriptors: *Planning, Political aspects, Institutions, Institutional constraints, Water law, *Legislation, *Arizona, *Decision making, Environmental effects.
Identifiers: *Central Arizona Project, *Warm Springs Dam(Ariz), *National Environmental Policy Act, *Environmental impact statements.

The environmental impact statement has an information generating role. But information is not neutral; its generation changes the substance of decision-making. The Centrl Arizona Project and the Warm Springs Dam are examples of water projects requiring environmental assessment. The information generated by each EIS was controversial, and higher standards for information gathering and use are needed to assign liability and to clarify risk analysis. NEPA applies universal and objective information demands to a political and ideological policy-making process.

6F. Nonstructural Alternatives

FLOOD MANAGEMENT STUDY.
Northern Tier Regional Planning and Development Commission, Towanda, Pa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 456, Price codes: A07 in paper copy, A01 in microfiche. Prepared for the Appalachian Regional Commission and the Department of Housing and Urban Development, Washington, D.C. Final Report, October 1974. 82 p, 7 tab, 11 map, 5 append. 73-82 HUD-CPA-1047, ARC-PA-2355/.

Descriptors: *Floods, Flooding, *Flood plain insurance, *Flood plain zoning, *Flood plains, *Flood control, *Non-structural alternatives, *Land use, Flood protection, Drainage channels, Wetlands, Shores, *Pennsylvania, Dams, Reservoirs.
Identifiers: *Flood plain management, Northern Tier Regional Planning and Development Commission, *Hurricane Agnes(1972), *Intermunicipal tax sharing, Appalachian Regional Commission, National Flood Insurance Program, Flood Hazard Boundary Maps.

The Northern Tier Region of PA lies between Elmira, New York and the Scranton/Wilkes - Barre, Pennsylvania metropolitan areas. Primarily rural, it has 160,000 people within 4,000 sq mi. The flood plain management plan was the result of joint HUD and Appalachian Regional Commission funding to provide a Agnes Flood Recovery Grant to the Northern Tier Regional Planning and

Development Commission (NTRPDC) following the 1972 flood from Hurricane Agnes. The report covers hydrology, existing flood control structures, plans and programs for protective works, physical development, management techniques (land use, zoning, intermunicipal tax sharing, flood insurance), economics and natural factors. Some recommendations are: flood management should be based on non-structural alternatives: conventional zoning, the National Flood Insurance Program, and a Development District approach should be given high priority for implementation; the Comprehensive Regional Plan should incorporate preservation of undeveloped aquifer recharge areas, limit flood plain development to agriculture, recreation and other non-structural uses, restrict development according to soil suitability, and preserve vegetative cover along streams and river banks, natural drainage channels, wetlands and shoreline areas; Flood Hazard Boundary Maps developed by the Federal Insurance Administration should define locations of flood plains. Physiographic data and lot and parcel maps can be used by municipalities within the study area to develop comprehensive plans with supporting zoning ordinances. Future flood management and comprehensive plans for the area can be based on data supplied by this study. (Gentry-North Carolina)

REGULATING ACTIVITIES WITH CATASTROPHIC ENVIRONMENTAL EFFECTS,
California Univ., Riverside. Dept. of Economics.
M. L. Cropper.
Journal of Environmental Economics and Management, Vol 3, No 1, p 1-15, 1976. 4 fig, 12 ref.

Descriptors: *Model studies, *Disasters, *Environmental effects, *Natural resources, *Regulation, Analytical techniques, Accidents, Exploitation, Nuclear powerplants, Water allocation(Policy), Optimization.
Identifiers: *Irreversible effects, *Pollution threshold, Utility, Disutility, Catastrophic pollution, Resource depletion, Nonrenewable resources.

Two models are developed for analyzing the natural resource impacts of two levels of disastrous activity outcomes. The first case hypothesized is that of catastrophic pollution such as might be created by accidents associated with nuclear power plants and stratospheric flight. Such a case involves a temporary reduction of utility, and the model captures the 'small probability of large loss' characteristic of pollution problems associated with these activities by assuming that the uncertain effects of pollution are potentially disastrous. The second case covers an irreversible catastrophe such as the inadvertant depletion of a nonrenewable resource for which no substitute is available. The latter might occur when the total amount of the resource extracted exceeds the uncertain resource stock. Disaster reduces the level of utility to zero, so that in utility terms, catastrophe is equal to zero consumption; the unique and stable equilibrium which characterizes many pollution control models no longer obtains and multiple-equilibria solutions are possible. In the case of resource depletion, it is shown that when reserves are uncertain the path of planned extraction is no longer necessarily monotonic and may even increase over time; future generations may be worse off under uncertainty than they would if the size of the resource stock were certain. (Harris-Wisconsin)

UNCERTAINTY AND THE CHOICE OF POLLUTION CONTROL INSTRUMENTS,
Tel Aviv Univ. (Israel). Dept. of Economics.
Z. Adar, and J. M. Griffin.
Journal of Environmental Economics and Management, Vol 3, No 3, p 178-188, 1976. 3 fig, 7 ref.

Descriptors: *Risks, *Pollution abatement, *Economic efficiency, *Pollution taxes(Charges), Standards, Welfare(Economics), Prices, Optimization, Mathematical studies.
Identifiers: Marginal damage function, Marginal control costs, Pollution rights, Auctions.

The relative efficiencies of pollution taxes, pollution standards, and the auctioning of pollution rights are compared, when the marginal damage function (MDF) or marginal control cost (MCC) are subject to uncertainty. uncertainty conditions are examined with respect to the three policy choices at the level of the pollution control agency, and at the firm level when combined with risk aversion. It is concluded that: (1) uncertainty in the marginal damage function has no effect on the choice between the three policy instruments, (2) uncertainty in the marginal control cost function will yield different expected welfare losses between taxes or standards or auctions depending on the variance of the stochastic error term and the slopes or elasticities of the MDF and MCC functions; and (3) this asymmetry holds even under risk aversion, with the welfare loss also dependent on the degree of risk aversion. In situations of uncertain MCC where MDF tends to be very price elastic, as with SO2 emissions, taxes seem most efficient. Where the MDF is very inelastic, quantitative restrictions of an auction or standards type seem to be desirable. in the latter case, standards introduce added informational uncertainty which seems to dominate possible welfare losses due to wide variations in auction prices. (Luedtke-Wisconsin)
W77-06704

OPTIMAL INVESTMENT IN POLLUTION CONTROL CAPITAL IN A NEOCLASSICAL GROWTH CONTEXT,
Pittsburgh Univ., Pa. Dept. of Economics.
G. W. Gruver.
Journal of Environmental Economics and Management, Vol 3, No 3, p 165-177, 1976. 6 fig, 9 ref.

Descriptors: *Pollution abatement, *Model studies, *Optimum development plans, Investment, Capital, Economic efficiency, Optimization, Mathematical models, Theoretical analysis.
Identifiers: Economic growth.

A neoclassical growth model is employed to study how the optimal division of investment between pollution control capital and directly productive capital varies over time, to determine if it would be optimal to have balanced investment or to specialize in one type of capital at a time, and if it is best to specialize, which type of capital should be accumulated first. Model assumptions treat pollution as a flow which can be measured by an appropriate index. It is considered to have a negative effect on aggregate utility, to be negatively related to the stock of pollution control capital, and to be positively related to aggregate output. The investment process is assumed to be irreversible. The model objective is to maximize the integral of discounted utility over a fixed planning period by optimal choice of the saving rate and of the relative proportion of savings to be allocated to production investment as opposed to pollution control capital. Results indicate that a balanced investment plan will not be optimal, and that the optimal approach would be to first invest in directly productive capital (even though this will cause the flow of pollution to increase) and then subsequently increase investment to control pollution. AN INPUT-OUTPUT ANALYSIS OF ENVIRONMENTAL PRESERVATION,
Manitoba Univ., Winnipeg. Dept. of Economics.
I. F. Lipnowski.
Journal of Environmental Economics and Management, Vol 3, No 3, p 205-214, 1976. 18 ref.

Descriptors: *Input-output analysis, *Pollution abatement, Economic feasibility, Mathematical models.
Identifiers: *Environmental quality, *Economic growth, Matrix.

The implications and technical feasibility of a policy of complete environmental preservation within the context of a closed, static input-output model is examined. A well-established criterion for gauging the growth potential of an economy, the technology of which can be represented by a nonnegative indecomposable square matrix, is reviewed. The concept of growth upon which this criterion is based is shown to be ambiguous since it ignored the environmental repercussions of economic activity. Assuming that the economy possesses an antipollution technology which may be included in an enlarged technology-environment matrix which is also nonnegative and indecomposable, an alternative criterion to gauge growth potential in the presence of complete environmental preservation is proposed. Building on this new base, the magnitude of the uniform rate of profit which would have to exist in order to assure the technical feasibility of effecting a sudden transition from a situation of zero antipollution activity to one of strict environmental preservation is formulated. Various factors which would facilitate

LIBRARY U. OF I. URBANA-CHAMP.

the implementation of an environmental preservation policy, such as technological progress, are also discussed. (Luedtke-Wisconsin)

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. PRINCIPAL INVESTIGATORS' REPORTS JULY-SEPTEMBER 1976. VOLUME 1: MARINE MAMMALS, MARINE BIRDS.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending September 1976. Vol 1. Marine Mammals, Marine Birds, November 1976, 601 p.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Mammals, Surveys, Birds, Migratory birds, Habitats, Ecology.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Gulf of Alaska, Bering Sea, Beaufort Sea, Bristol Bay, Norton Sound.

This volume contains the quarterly reports of baseline studies on the environmental effects related to petroleum development on the Alaskan Continental Shelf. The multi-year program is directed by the National Oceanic and Atmospheric Administration under the sponsorship of the Bureau of Land Management. The baseline studies in this volume encompass marine mammals and marine birds. (See also W77-06794 thru W77-06824) (Sinha-OEIS)
W77-06793

BASELINE CHARACTERIZATION OF MARINE MAMMALS IN THE BERING SEA,
National Marine Fisheries Service, Seattle, Wash. Marine Mammal Div.
C. H. Fiscus, H. W. Braham, and R. D. Everitt.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 3-29, November 1976. 9 fig, 4 tab, 3 ref.

Descriptors: *Alaska, *Mammals, *Baseline studies, *Resources development, *Environmental effects, *Ecological distribution, Continental Shelf, Ecology, Data collections, Surveys, Seasonal, Water resources.
Identifiers: *Outer Continental Shelf, *Bering Sea, Environmental assessment, Environmental impact, Harbor seals, Sea lions, Whales, Eumetopias, Ziphius cavirostris, Cetaceans.

The number of marine mammals observed along the north coast of the Alaska Penisula and throughout the eastern Aleutian Islands is summarized. The total number of animals for all species scored is preliminary and does not necessarily reflect the actual number of animals present in each area surveyed. Additional estimates of animal numbers (i.e., relative abundance) will be provided in the annual report after a systematic analysis of the aerial photographs and other aerial survey data can be prepared. Heavy fog along the Alaska Peninsula and on the northern side of the eastern Aleutian Island not only hindered survey of pinniped rookery and hauling areas but also made observing for cetaceans difficult. Undoubtedly, the number of cetaceans seen does not reflect the total number in this area at this time of the year. (See also W77-06793) (Sinha-OEIS)
W77-06794

ABUNDANCE AND SEASONAL DISTRIBUTION OF MARINE MAMMALS IN THE GULF OF ALASKA,
National Marine Fisheries Service, Seattle, Wash. Marine Mammal Div.
C. H. Fiscus, H. W. Braham, and R. W. Mercer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 30-32, November 1976. R71208606.

Descriptors: *Alaska, *Baseline studies, *Ecological distribution, *Resources development, *Data collections, *Environmental effects, Water resources, *Mammals, Surveys.
Identifiers: *Outer Continental Shelf, *Gulf of Alaska, Environmental assessment, Environmental impact, Eumetopius jubatus, Eschrichtius robustus.

The northern and coastal regions of the Gulf of Alaska are expected to be important areas where oil-gas research and tanker traffic will occur. These areas also represent localized habitats for breeding marine mammals (e.g. northern sea lion, Eumetopius jubatus) and for seasonal migration (e.g. California gray whale, Eschrichtius robustus). The baseline objectives of this project are to provide an understanding of the relative seasonal distribution and abundance of marine mammals. Sighting records taken aboard NOAA ships and chartered vessels working in and crossing the gulf in this quarter, data from aircraft surveys collected by supporting OCSEAP projects, and historical whaling and sealing records have been gathered and prepared for analysis. (See also W77-06793) (Sinha-OEIS)
W77-06795

DISTRIBUTION AND ABUNDANCE OF BOWHEAD AND BELUKHA WHALES IN THE BERING AND CHUKCHI SEAS,
National Marine Fisheries Service, Seattle, Wash. Marine Mammal Div.
C. H. Fiscus, H. W. Braham, B. D. Krogman, and R. D. Everitt.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 33-42, November 1976. 1 tab. R7120807-8.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Ecological distribution, *Data collections, *Environmental effects, Water resources, Mammals, Surveys.
Identifiers: *Outer Continental Shelf, *Environmental assessment, Environmental impact, Beaufort Sea, *Chukchi Sea, Aerial surveys, Whales, Cetaceans, Balaena mystecetus, Delphinapterus leucas, *Bering Sea.

The objectives of this project were to make estimates on the distribution and abundance of bowhead (Balaena mystecetus) and belukha (Delphinapterus leucas) whales in the Bering and Chukchi Seas. Observations on marine mammals were made throughout the daylight hours on ship cruises. Other data recorded were animal behavior, environmental parameters, exact position, etc. Computer programs were written which will allow all bowhead and belukha sightings to be plotted by time and position. The fall aerial surveys were initiated 20 September and originated from the Naval Arctic Research Laboratory. Flights were made east and west of Barrow, AK along the coast, as well as over offshore areas extending out to the edge of the pack ice approximately 15-20 miles from shore. Visual estimates were made and photographs taken to verify species identification and numbers of animals seen. (See also W77-06793) (Sinha-OEIS)
W77-06796

THE NATURAL HISTORY AND ECOLOGY OF THE BEARDED SEAL (ERIGNATHUS BARBATUS) AND THE RINGED SEAL (PHOCA (PUSA) HISPIDA),
Alaska Dept. of Fish and Game, Fairbanks.
T. J. Eley, and J. J. Burns.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 55-124, November 1976. 6 tab, 4 ref, 4 append. 02-5-022-53.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Distribution patterns, *Mammals, Ecology, Biology, Pathology.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, Bering Sea, *Beaufort Sea, *Chukchi Sea, Phocidae, Pinnipedia, Biological collections.

The objectives of this investigation were to provide a summarization and evaluation of existing literature and available unpublished data on reproduction, distribution, abundance, food habits and human dependence on bearded and ringed seals in the Bering, Chukchi and Beaufort Seas, and to assure the acquisition of large amounts of specimen material required for an understanding of food habits in these two species, and the acquisition of additional data of productivity and growth rates. Major efforts in this quarter were devoted to field activities. One hundred and sixty-three ringed seals and 99 bearded seals were obtained or collected. Measurements, jaws, claws, stomachs and reproductive tracts were obtained from most specimens. Analysis of reproduction and growth is critically dependent on accurate determination of the age of specimens. Although a number of measurements have been made age data is not yet available from enough individuals to allow meaningful analysis. A draft report of Marine Mammal Diseases and Parasites by Caro A. Nielson is included as Appendix 4 of this report. (See also W77-06793) (Sinha-OEIS)
W77-06799

AN AERIAL CENSUS OF SPOTTED SEALS PHOCA VITULINA LARGHA,
Alaska Dept. of Fish and Game, Fairbanks.
J. J. Burns, and S. J. Harbo, Jr.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 125-26, November 1976. 03-5-022-53.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Mammals, Sea ice.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Seals(Spotted), *Bering Sea, Seasonal distribution, Phoca vitulina largha.

Determination was made of the seasonal density and distribution of spotted seals, Phoca vitulina largha, in the ice front of eastern Bering Sea. During later winter and early spring, this seal occurs in considerable numbers, within the proposed Bristol Bay, St. George Basin and Navarin Basin lease areas. All data collected have been transcribed from field record forms to computer forms. These

forms have been keypundhed and verified. (See also W77,06793) (Sinha-OEIS)
W77-06800

IDENTIFICATION, DOCUMENTATION AND DELINEATION OF COASTAL MIGRATORY BIRD HABITAT IN ALASKA,
Alaska Dept. of Fish and Game, Fairbanks.
P. D. Arneson.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 170-196, November 1976. 10 fig, 6 tab. 03-5-022-69.

Descriptors: *Alaska, *Baseline studies, *Resources development, Data collections, *Ecological distribution, *Environmental effects, Water resources, *Migratory birds, Birds, Habitats, Littoral, Estuaries.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Gulf of Alaska, *Bristol Bay, *Beaufort Sea, *Chukchi Sea.

The objectives of this investigation were to summarize and evaluate existing literature and unpublished data on the distribution, abundance, behavior, and food dependencies of birds associated with littoral and estuarine habitat in the Gulf of Alaska, Bristol Bay, Beaufort Sea and Chukchi Sea, and on barrier islands in the Beaufort Sea. Other objectives were to determine seasonal density distribution, critical habitats, migratory routes, and breeding locales for principal bird species in the study area and identify critical species particularly in regard to possible effects of oil and gas development. The technique used for shoreline bird surveys was flying in single-engine, high wing aircraft at an altitude of approximately 30-45 meters and speed of 160 kilometers per hour. Observers were used on both sides of the aircraft. All observations were recorded on cassette-type tape recorders. It was determined that southern Bristol Bay is a very important summering area for birds. The regions surveyed represent only a small portion of the southern Bering Sea area. (See also W77-06793) (Sinha-OEIS)
W77-06804

IDENTIFICATION, DOCUMENTATION, AND DELINEATION OF COASTAL MIGRATORY BIRD HABITAT IN ALASKA, AND THE DISTRIBUTION, ABUNDANCE AND FEEDING ECOLOGY OF BIRDS ASSOCIATED WITH PACK ICE,
Alaska Dept. of Fish and Game, Fairbanks.
G. J. Divoky.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 197-215, November 1976. 1 fig.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Migratory birds, Sea ice, Distribution patterns.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea, *Pack ice.

Aerial censusing was the primary means of obtaining information on bird use of coastal waters. Transects along the coast were walked in order to determine numbers and activities of species using nshore waters, adjacent beach and tundra. Observations were also made on shipboard while underway. All birds within a 300 m wide ransect were ounted. Detaild ice observations were made during each transect and the activities of birds in relaion to ice were noted. Preliminary results for the ruises in the Bering Sea indicate that the greatest oncentrations of birds seen on the Surveyor ruise were in the leads and polynias of the ice over the continental shelf. These ice openings had densities averaging over 600 birds per square kilometer and ranged up to 8000 birds per square kilometer. Lower concentrations were found immediately south of the ice edge. Much lower densities were characteristic of Bering Sea waters with depths greater than 200 meters. (See also W77-06793) (Sinha-OEIS)
W77-06805

ECOSYSTEM DYNAMICS BIRDS AND MARINE MAMMALS. PART I: PRELIMINARY ESTIMATES OF PINNIPED - FINFISH RELATIONSHIPS IN THE BERING SEA,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
W. B. McAlister, and M. A. Perez.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 219-248, November 1976. 4 fig, 11 tab, 26 ref.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Ecosystems, *Trophic levels, Mammals, Fish, Birds, Food habits.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea, Pinnipedia.

Studies reported represent the results of research proposed to integrate and synthesize data into a conceptual submodel of the ecosystem describing tropho-dynamic relationships in the eastern Bering Sea including interactions among northern fur seals, other marine mammals, marine birds, and several species of fish. The amount of food consumed by fur seals and other pinnipeds has been estimated and compared with the amount of fish caught by commercial fisheries in the same waters. Although this report is preliminary and the first step in a detailed process of analyzing all known data on the feeding reltionships of pinnipeds, it does appear to provide a good estimate of the range of finfish consumption by fur seals and other pinnipeds. (See also W77-06793) (Sinha-OEIS)

ECOSYSTEM DYNAMICS BIRDS AND MARINE MAMMALS. PART II: FOOD WEB STRUCTURE AND TROPHIC RELATIONS OF BERING SEA AVIFAUNA (PRELIMINARY REPORT),
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
G. A. Sanger.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 249-263, November 1976. 2 fig, 6 tab, 11 ref.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Birds, *Food habits, *Food webs, Population.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea, Trophic relationships, Feeding behavior, Uria spp., Puffinus tenuirostris, Seasonal distribution.

This report summarizes published and unpublished information on population sizes, seasonal changes in distribution and abundance, and feeding behavior and food habits of murres (Uria spp.) and short-tailed shearwaters (Puffinus tenuirostris) in the eastern Bering Sea. This report is largely a compilation of basic information in tabular form. (See also W77-06793) (Sinha-OEIS)
W77-06807

ECOSYSTEM DYNAMICS BIRDS AND MARINE MAMMALS. PART III: A DYNAMIC NUMERICAL MARINE ECOSYSTEM MODEL FOR EVALUATION OF MARINE RESOURCES IN EASTERN BERING SEA,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
T. Laevastu, F. Favorite, and W. B. McAlister.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 264-377, November 1976. 24 fig, 6 tab, 12 ref, append.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Model studies, Ecosystems.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea, Numerical models, Food availability.

The objective of this project is to design and program a complete marine ecosystem model for quantitative evaluation of: the effects of man, environmental changes (anomalies), and interspecies interactions on the dynamics of marine ecosystem, with emphasis on economically important species. The concept and design of Dynamical Numerical Marine Ecosystem Model (DYNUMES) is described and results obtained from an 8-component version of the model are presented. The use and utility of the DYNUMES model is tested and results indicated several phenomena within the ecosystem that have received little attention in the past research, but which seem to be among major determinants of the balance within the system. One of the general conclusions from the use of the model is that availability of food is a limiting factor for most ecological levels and groups. (See also W77-06793) (Sinha-OEIS)
W77-06808

REPRODUCTIVE ECOLOGY OF PRIBILOF ISLAND SEABIRDS,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
G. L. Hunt, Jr.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 378-387, November 1976. 1 fig. 03-5-022-72.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Birds, Ecology, Reproduction, Population, Phenology, Food habits.
Identifiers: *Outer Continental Shelf, *Pribilof Islands, Bering Sea, Environmental assessment, Environmental impact.

Objectives of this investigation were: to determine the phenology of seabirds nesting on St. Paul and St. George Islands; to evaluate reproductive success of seabirds nesting on St. Paul and St. George Islands; to determine food habits of Pribilof Island Seabirds; to conduct radial transects by ship in the vicinity of St. Paul and St. George Islands; and to aid in the estimation of popultion size of Pribilof Island seabirds. Results suggest that most alcids forage fairly close to the island where they nest, usually within 10 nautical miles. Tufted and Horned Puffins may travel further off shore. Cormorants forage close to their islands. Fulmars appear to move far off shore, and black-legged kittiwakes may forage in large flocks in tide-rips near the ends of their nesting islands. COMMUNITY STRUCTURE, DISTRIBUTION, AND INTERRELATIONSHIPS OF MARINE BIRDS IN THE GULF OF ALASKA,
Oregon State Univ., Corvallis. Dept. of Zoology.
J. A. Wiens.

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 391-403, November 1976. 03-5-022-68.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Water pollution, *Water birds, Birds, Ecosystems, Populations.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Gulf of Alaska.

Patterns of seasonal abundance and distribution were studied because of their direct relevance to oil development and transport activities, and also to use in analysis of marine bird energetic impacts. The dynamics of feeding flocks of seabirds were investigated to determine the degrees and directions of dependency and/or interference between seabird species. This involves a description of the roles of different species in flock formation and development and an analysis of their contribution to the efficiency and performance of the system as a whole. Observations were made at all periods of the day but were largely dependent upon weather, visibility and ship's activity. Specimens were collected by shotgun for analysis of food habits. W77-06810

SHOREBIRD DEPENDENCE ON ARCTIC LITTORAL HABITATS,
California Univ., Bodega Bay. Bodega Marine Lab.
R. W. Risebrough, and P. G. Connors.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 404-408, November 1976.

Descriptors: *Alaska, *Arctic, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, *Water resources, *Water birds, *Oil pollution, *Shore birds, Littoral, Habitats, Ecology.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, Seasonal variations.

The assessment of the degree and natural of dependence of each shorebird species on Arctic habitats which may be susceptible to perturbation from offshore oil development activities entails three major areas of investigation: Seasonal occurrence of shorebirds by species, in a variety of arctic littoral and near-littoral habitats; foraging habitat preferences of shorebirds within the littoral zone, by species; and diets of shorebirds in the arctic littoral zone, by species, as these change through the season. Approximately 500 transect censuses were completed during this period. In general, the timing of movements of shorebirds in littoral areas agreed with the pattern established during the 1975 season, but with several differences, especially in population magnitudes. The most striking difference discovered, however, was the change in plankton composition and density along the gravel shorelines. (See also W77-06793) (Sinha-OEIS)

In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 409-447, November 1976. 11 fig, 1 tab, 20 ref, append. 03-5-022-56.

Descriptors: *Alaska, *Migratory birds, *Baseline studies, Resources development, Data collections, *Ecological distribution, *Environmental effects, Water resources, *Oil pollution, Barrier islands, *Water pollution effects, Population, Shore birds, Seasonal, Ecology.
Identifiers: *Outer Continental Shelf, *Prudhoe Bay, Egg Island(AK), Environmental assessment, Environmental impact, Common Eiders, King Eiders, Oldsquaw, Somateria mollissima, Somateria spectabilis, Clangula hyemalis.

The objective of the study was to document changes in numbers and activity patterns of avifauna over time and space. Census work was conducted with a 1.8 km radius from an observation blind on Egg Island. Egg Island is a barrier inlet on the Beaufort Sea cost which was found to have the greatest concentration of nesting eiders during a preliminary survey of islands in this area. Mean densities of birds were greatest on 24 June and on 20 July. These figures correspond to the peaks of spring and summer migration, respectively. Spring migration is concentrated almost entirely at sea. The bay is used increasingly by birds from early July through August. The most numerous birds in the area (Common Eiders, King Eiders, and Oldsquaw) are all highly susceptible to oil spills. Since Common Eiders and, to a lesser extent, King Eiders breed on barrier islands, oil development on these islands could interfere with nesting. (See also W77-06793) (Sinha-OEIS)
W77-06812

BIRDS OF COASTAL HABITAT ON THE SOUTH SHORE OF SEWARD PENINSULA, ALASKA,
College of the Atlantic, Bar Harbor, Maine.
W. H. Drury.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 448-468, November 1976. 5 tab. 03-5-022-77.

Descriptors: *Alaska, *Shorebirds, *Water birds, *Waterfowl, *Water pollution effects, *Baseline studies, Resources development, Data collections, *Ecological distribution, *Environmental effects, Water resources, Birds, Coasts, Habitats, Population.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Seward Peninsula(Alas).

Studies of populations, community structure and ecology of marine birds at Bluff Cliffs and Sledge Island and surveys of the use of coastal habitats by waterfowl and shorebirds are the objectives of this investigation. Field activities are reported and species number and distribution are down in tables. (See also W77-06793) (Sinha-OEIS)
W77-06813

ECOLOGY AND BEHAVIOR OF SOUTHERN HEMISPHERE SHEARWATERS (GENUS PUFFINUS) AND OTHER SEABIRDS, WHEN OVER THE OUTER CONTINENTAL SHELF OF THE BERING SEA AND GULF OF ALASKA DURING THE NORTHERN SUMMER,
Calgary Univ., (Alberta).
J. Guzman.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 469-478, November 1976. 2 fig.

Descriptors: *Alaska, *Baseline studies, Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Birds, Distribution patterns, Ecology, Weather, Pollutants.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea, *Gulf of Alaska, Shearwaters, Puffinus tenuirostris, Puffinus griseus.

The degree of overlap in the geographical distribution of the Short-tailed Shearwater (Puffinus tenuirestris) and the Sooty Shearwater (Puffinus griseus) during the northern summer in the study area, and the relationship between the distribution of these Shearwaters and particular water conditions, the distance from shore, the foods available to them, and the passage of weather systems were studied during the cruise of the DISCOVERER. (See also W77-06793) (Sinha-OEIS)
W77-06814

SEASONAL DISTRIBUTION AND ABUNDANCE OF MARINE BIRDS,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and J. C. Bartonek.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 479-484, November 1976. 1 tab. 01-5-022-2538.

Descriptors: *Alaska, *Baseline studies, Resources development, Data collections, *Ecological distribution, *Environmental effects, Water resources, *Population, *Birds, *Surveys, *Water pollution, Seasonal, Coasts, Ecosystems, Leases.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Gulf of Alaska, *Bering Sea, Arctic Ocean.

The objective of this research unit was to describe the seasonal density distribution of marine birds in those portions of the Gulf of Alaska, the Bering Sea, and the Arctic Ocean that have been identified by the U.S. Department of the Interior for leasing and development of their oil and gas potentials. This research considered only the offshore environment and did not include species generally confined to the nearshore and littoral habitats. It did not directly consider the distribution of pelagic species when they occupy shoreline habitats such as during the breeding season. Effort continued during this quarter to bet shipboard survey data into a form useable for automatic data processing. (See also W77-06793) (Sinha-OEIS)
W77-06815

PRELIMINARY CATALOG OF SEABIRD COLONIES AND PHOTOGRAPHIC MAPPING OF SEABIRD COLONIES,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and J. C. Bartonek.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 485-524, November 1976. 21 fig, 2 tab. 01-5-022-2538/01-06-022-11437.

Descriptors: *Alaska, *Baseline studies, *Resources development, Data collections, *Ecological distribution, *Environmental effects, Water resources, Bird, Distribution patterns, Population, Surveys.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bristol Bay(Alas).

This report contains the preliminary catalog of seabird colonies in the Bristol Bay Basin and a summary of other activities during the quarter. The location and relative size of marine bird colonies bounding the Bristol basin are summarized and information is given about their location, composition, size, and amount of land occupied. (See also W77-06793) (Sinha-OEIS)
W77-06816

REVIEW AND ANALYSIS OF LITERATURE AND UNPUBLISHED DATA ON MARINE BIRDS,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and J. C. Bartonek.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 525-538, November 1976. 01-6-022-11437.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Birds, Bibliographies, Leases.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bristol Bay Basin(Alas).

A bibliography of source information on bird resources in the Bristol Bay Basin (exclusive of St. George Basin) OCS lease sale area was prepared for the Service's response to the Bureau of Land Management's request for environmental data to be used in thier deliberations on tract selection and deletion. (See also W77-06793) (Sinha-OEIS)
W77-06817

MIGRATION OF BIRDS IN ALASKA COASTAL AND MARINE HABITATS SUBJECT TO INFLUENCE BY OCS DEVELOPMENT,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and J. C. Bartonek.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 539-541, November 1976. 01-6-022-11437.

Descriptors: *Alaska, *Baseline studies, Resources development, *Data collections, Ecological distribution, *Environmental effects, Water resources, Birds, Migratory birds, Migrations, Habitats.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact.

This report is a summary of efforts mainly during the quarter by U.S. Fish and Wildlife Service personnel, contractees, and collaborators to characterize the migration of birds inthose Alaskan waters subject to pertoleum development of the outer continental shelf. Information is presented on banding efforts, recent reports of sightings of banded birds, sea watch efforts, and a report of bird migration past Pt. Barrow during the fall of 1975. (See also W77-06793) (Sinha-OEIS)
W77-06818

FEEDING ECOLOGY AND TROPHIC RELATIONSHIPS OF ALASKAN MARINE BIRD, AND POPULATION DYNAMICS OF MARINE BIRDS,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and J. C. Bartonek.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 542-553, November 1976. 3 tab. 01-5-022-2538.

Descriptors: *Alaska, *Baseline studies, Resources development, *Data collections, Ecological distribution, *Environmental effects, Water resources, Ecology, Birds, Food habits.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, Population dynamics, Trophic relationships, *Gulf of Alaska, *Bering Sea.

Research Units RU 341 and 342 were designed to help satisfy the objectives which are to describe the trophic relationships and the population dynamics of selected species at offshore and coastal study sites. Since personnel, coastal study sites and ships, are largely indentical the two research unites are treated together in this report. Activities under these two unites were largely restricted to the Gulf of Alaska and the southeastern Bering Sea. Most study sites were selected because of the dominant species present, their unique habitat, and the potential vulnerability of the locality to impact from OCS activities. Information on both trophic relationships and population dynamics were collected at most of these sites. Birds were collected during 4 cruises and at 14 field sites for determination of food habits. (See also W77-06793) (Sinha-OEIS)
W77-06819

AVIAN COMMUNITY ECOLOGY AT TWO SITES ON ESPENBERG PENINSULA IN KOTZEBUE SOUND, ALASKA. A COMPOSITE STUDY OF: (1) HABITAT UTILIZATION AND BREEDING ECOLOGY OF WATERBIRDS, (2) HABITAT UTILIZATION AND BREEDING ECOLOGY OF SHOREBIRDS AND NON-WATERBIRD SPECIES, AND (3) HABITAT UTILIZATION, BREEDING ECOLOGY, AND FEEDING ECOLOGY OF PREDATORS OF BIRDS,
Alaska Univ., College. Inst. of Arctic Biology.
D. Schamel, D. Tracy, and A. Ionson.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 554-576, November 1976. 2 fig, 3 tab. 03-5-022-56.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Birds, *Waterfowl, Habitats, Breeding, Ecology, Phenology, Shore birds.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Kotzebue Sound(Alas).

As a result of field activities to evaluate avian activities in Kotzebue Sound, a list of 68 species of birds seen on Cape Espenbert in 1976 and the breeding status of each is given. Those birds listed as 'common' nesters were abundantly breeding throughout the Cape. 'Moderate' nesting species were either found in moderate breeding densities throughout the Cape or were locally abundant only. When only a few nests of a species were found, the bird was given the 'uncommon' status. 'Probable' nesters are those species that established and defended territories or acted 'broody' but for which neither nests nor broods were found. All other birds were placed in the 'not nesting' category. The complete results of the banding operation is also presented. (See also W77-06793) (Sinha-OEIS)
W77-06820

STUDIES OF POPULATIONS, COMMUNITY STRUCTURE AND COLONY OF MARINE BIRDS AT KING ISLAND, BERING STRAIT REGION, ALASKA,
College of the Atlantic, Bar Harbor, Maine.
W. H. Drury.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 577-585, November 1976. 03-6-022-35208.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Birds, Population, Ecology, Breeding, Phenology.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea.

The objectives were to determine the number and distribution of each species relative to other species, to periods of the breeding season, and to characteristics of available habitat within the colony or study area. Other objectives were to provide estimates of nesting success of principal species, to determine the amount and kinds of foods utilized by the principal species, and to describe the chronology and phenology of events in the biology of breeding birds, including changes in population from the beginning of site occupation in the spring through departure in the fall. Seven study sites were established and three air transect routes were followed in the SE Chirikov Basin and five surface transect routes were followed. A preliminary synthesis of data and interpretation is given. (See also W77-06793) (Sinha-OEIS)
W77-06821

AVIAN COMMUNITY ECOLOGY OF THE AKULIK - INGLUTALIK RIVER DELTA, NORTON BAY, ALASKA,
Alaska Univ., College. Inst. of Arctic Biology.
G. F. Shields, and L. J. Peyton.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 586-588, November 1976. 03-5-022-56.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, Ecology, Populations, Distribution patterns, Breeding.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Norton Bay(Alas).

The objectives of the investigation were to define the ecology community structure and populations of marine birds of the Akulik - Inglutalik Data area, Norton Bay, Alaska. Field data was obtained on the numbers and distribution of the birds utilizing the study area, their nesting density, their clutch sizes, and their hatching success. (See also W77-06793) (Sinha-OEIS)
W77-06822

A COMPARATIVE SEA-CLIFF BIRD INVENTORY OF THE CAPE THOMPSON VICINITY, ALASKA,
D. G. Roseneau, and A. M. Springer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 589-593, November 1976. 1 ref. 03-6-022-35210.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Birds, Habitats, Breeding, Population, Ecology.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Sea-cliff birds, Murres, Kittiwakes, Puffins, Gulls, *Cape Thompson(Alas), Cape Lisburne.

This report provides information on field activities and laboratory activities on the sea cliff birds (murres, black-legged kittiwakes, horned puffins, and glaucous gulls) at Cape Thompson and comparisons with bird populations at Cape Lisburne. The murre population at Cape Lisburne was about the same as at Cape Thompson, although breeding appeared to be advanced at Cape Lisburne. Counts of the kittiwakes were not made at Cape Lisburne although reproductive success was noticeably better than at Cape Thompson. It is speculated that the late winter and spring might be one of the factors resulting in poor reproductive success of the kittiwakes at Cape Thompson this year. (See also W77-06793) (Sinha-OEIS)
W77-06823

CHARACTERIZATION OF COASTAL HABITAT FOR MIGRATORY BIRDS: NORTHERN BERING SEA,
Fish and Wildlife Service, Anchorage, Alaska. Office of Biological Services and Coastal Ecosystems.
C. J. Lensink, and R. D. Jones, Jr.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 1. Marine Mammals, Marine Birds, p 594-596, November 1976. 01-6-022-15670.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Data collections, *Ecological distribution, *Environmental effects, Water resources, *Habitats, *Migratory birds, Intertidal areas, Land use, Ecology, Coasts.
Identifiers: *Outer Continental Shelf, Environmental assessment, Environmental impact, *Bering Sea.

The area covered by this study extends from Cape Newenham to the Bering Straits and relates most directly to the proposed developments in Norton Sound. The objectives of the study were to to characterize coastal habitat utilized by marine birds by: describing extent and characteristics of unvegetated intertidal beaches; describing extent and characteristic of intertidal plant communities; identifying the maximum limit of tidal influence of terrestrial habitat by mapping the occurrence of drift lines; identify ownership status (private or public) and responsible land management agency; and identify and quantify existing land uses; and to characterize use of habitat by birds including identification of principal species, identification of habitat use and identifying relative or approximate numbers of birds utilizing habitats seasonally. Primary effort during the quarter was devoted to field studies on the Yukon Delta north and west of Kotlik. (See also W77-06793) (Sinha-OEIS)
W77-06824

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF. PRINCIPAL INVESTIGATORS' REPORTS JULY-SEPTEMBER 1976. VOLUME 2: FISH, PLANKTON, BENTHOS, LITTORAL.
National Oceanic and Atmospheric Administration, Boulder, Colo. Environmental Research Labs.
Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending September 1976. Vol 2. Fish, Plankton, Benthos, Littoral, November 1976, 535 p.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Environmental effects, Water resources, *Data collections, Aquatic life, Marine fish, Plankton, Aquatic algae, Benthos.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Gulf of Alaska, Bering Sea, Beaufort Sea, Cook Inlet, Kodiak Island.

This volume contains the quarterly reports of baseline studies on the environmental effects related to petroleum development on the Alaskan Continental Shelf. The multi-year program is directed by the National Oceanic and Atmospheric Administration under the sponsorship of the Bureau of Land Management. The baseline studies in this volume encompass fish, plankton, benthos and littoral biota. (See W77-06826 thru W77-06849) (Sinha-OEIS)
W77-06825

THE DISTRIBUTION, ABUNDANCE, DIVERSITY AND PRODUCTIVITY OF BENTHIC ORGANISMS IN THE BERING SEA,
Alaska Univ., College. Inst. of Marine Science.
H. M. Feder.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 1-5, November 1976. 03-5-022-56.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Environmental effects, Water resources, *Benthos, *Aquatic populations, *Ecosystems, *Ecology, Data collections, Leases, Oil industry.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Bering Sea, Resource availability, Oil lease sites.

Objectives of the study were to make qualitative and quantitative census of dominant species within oil lease sites and to provide descriptions of seasonal and spatial distribution patterns, with emphasis on assessing patchiness and correlation with microhabitat. Comparisons of species distribution with physical, chemical and geological factors were to be made and observations of biological interrelationships in benthic biota of the study area were to be documented. A selected set of stations from the cruise of the R/V DISCOVERER in 1975 have been processed by the Marine Sorting Center. This data has been keypunched, and analysis, inclusive of cluster analysis, will take place when 60 selected stations on the MB grid have been completely processed. (See also W77-06825) (Sinha-OEIS)
W77-06826

SPAWNING HERRING SURVEYS IN THE BERING SEA AND FINFISH RESOURCE SURVEYS IN NORTON SOUND AND KOTZEBUE SOUND,
Alaska Dept. of Fish and Game, Anchorage. Div. of Commercial Fisheries.
L. H. Barton.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Report for the Quarter Ending September 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 41-102, November 1976. 3 fig, 3 tab, append.

Descriptors: Water resources, *Fish populations, *Alaska, *Spawning, *Data collections, *Fish migration, *Baseline studies, *Resources development, *Water pollution effects, *Environmental effects, Distribution patterns, Herrings, Salmon.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Bering Sea, Norton Sound, Kotzebue Sound, Finfishes, Geographic distribution, Capelin, Fishery resources, Resources availability.

The progress of activities extending through September 30, 1976 for two OCS Research Units are reported. The objectives of these research units were to: determine the spatial and temporal distribution, species composition and relative abundance of finfishes in the coastal waters of Norton Sound and Kotzebue Sound east of 166 W longitude; determine the timing and routes of juvenile salmon migrations as well as examine age and growth, relative maturity and food habits of important species in Norton Sound and Kotzebue Sound east of 166 W longitude; determine the spatial and temporal distribution and relative abundance of spawning populations of herring and capelin from Unimak Pass to Point Hope; monitor egg density, distribution and development and document types of spawning substrates of herring and capelin; and monitor the subsistence utilization of fishery resources by local residents. An appendix written by Irving M. Warner and Pamela M. Shafford reports on the field activities and laboratory activities for the forage fish spawning surveys from Unimak Pass to Ugashik River. (See also W77-06825) (Sinha-OEIS)
W77-06828

PELAGIC AND DEMERSAL FISH ASSESSMENT IN THE LOWER COOK INLET ESTUARY SYSTEM,
Alaska Dept. of Fish and Game, Kodiak.
J. E. Blackburn.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 103-113, November 1976. 2 fig, 3 tab.

Descriptors: Water resources, *Alaska, *Data collections, *Baseline studies, *Meteorological data, *Fish populations, *Resource development, *Environmental effects, *Distribution patterns, Migrations, Spawning, Estuaries.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Pelagic fish, Demersal fish, Cook Inlet, Fish assessment.

Activities, progress and some preliminary results on Cook Inlet Pelagic and Demersal Fish Studies from July through September 1976 are reported. The study area for this project includes lower Cook Inlet from the Forelands to 59 N latitude and west of 152 W longitude, south of Pt. Bede on the Kenai Peninsula. Some objectives of this project were to: determine the spatial and temporal (May-September) distribution, relative abundance and inter-relationships of the various pelagic and demersal finfish and shellfish species in the study area; determine when, where, at what rate and in what relative abundance pelagic fish species (primarily salmonids) migrate into and through the study area; and determine the growth rate and food habits of selected pelagic and demersal fish species. (See also W77-06825) (Sinha-OEIS)
W77-06829

RAZOR CLAM (SILIQUA PATULA, DIXON) DISTRIBUTION AND POPULATION ASSESSMENT STUDY,
Alaska Dept. of Fish and Game, Kodiak. Div. of Commercial Fisheries.
R. J. Kaiser, and D. Konigsberg.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 115-162, November 1976. 15 fig, 8 tab. 03-5-022-69.

Descriptors: Water resources, *Alaska, *Clams, *Distribution patterns, *Baseline studies, *Resource development, *Environmental effects, Data collections, Beaches, Sediment, Ecology, Intertidal areas.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Population assessment, Substrates, Pacific razor clam, Siliqua patula.

Specific objectives of this study were to gather information of bivalve density, distribution, age and growth (razor clams only), and habitat on beaches from Yakutat Bay at 139 degrees west longitude to Unimak Bight on the Alaska Peninsula. Nine sandy beach areas were investigated and each organism's location was identified with regard to the extent of the specie's existance, density, and habitat. Bivalves were collected and identified at each location and density, length, and age composition was assessed. Core samples were collected at each base site to investigate substrate composition and grain size. Severe weather conditions proved to be the limiting factor in terms of the amount of work accomplished. (See also W77-06825) (Sinha-OEIS)
W77-06830

RESOURCES OF NON-SALMONID PELAGIC FISH OF THE EASTERN BERING SEA AND THE GULF OF ALASKA,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
W. T. Pereyra, and M. O. Nelson.

In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 173-251, November 1976. 2 fig, 1 tab. R7120811 and R7120812.

Descriptors: Fishes, *Alaska, *Bibliographies, *Baseline studies, Water resources, *Resources development, *Environmental effects, Distribution patterns, Abundance, Populations.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Pelagic fish, *Bering Sea, *Gulf of Alaska, Fishery resources, Life histories, Resource availability.

In spite of difficulties encountered during the quarter, a nine track magnetic computer tape containing all non-proprietary data pertaining to sampling and catches of nonsalmonids under study was provided. A report describing the data record, methods of data acquisition, reliability and accuracy estimates, and evaluation of individual records was given. This report consists chiefly of an annotated bibliography of 208 references and abstracts containing information on pelagic fish within the target areas. The abstracts are arranged alphabetically by author and data and are cross indexed according to subject matter and general geographic area. Individual species were selected for inclusion in the bibliography on the basis of their prominence in the catches of both United States and foreign commercial fishing fleets, their relative abundance in research vessel catches indicating potentially latent resources, and/or their prominence in the provision and maintenance of ecological balance as major predators, competitors, or forage fish. The final list of species includes 15 families and more than 22 individual species. (See also W77-06825) (Sinha-OEIS)
W77-06832

BASELINE/RECONNAISSANCE CHARACTERIZATION, LITTORAL BIOTA, GULF OF ALASKA AND BERING SEA,
National Marine Fisheries Service, Auke Bay, Alaska. Auke Bay Fisheries Lab; and National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
S. T. Zimmerman, and T. R. Merrell, Jr.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 252-267, November 1976. 1 tab.

Descriptors: *Alaska, Water resources, *Baseline studies, *Resources development, *Habitats, *Data collections, *Environmental effects, Coasts, Biota, Oil industry, Exploration, *Distribution patterns, Populations.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Gulf of Alaska, *Bering Sea.

There were two objectives in this study: to determine the distribution of the major habitat types (sandy, muddy, rocky, etc.) along the coastline; and to determine the densities and distribution of biotic populations within these habitat types. The distribution of habitat was determined by visual reconnaissance methods from fixed wing aircraft. Additional information utilizing aerial photography and multispectral scanning methods was produced in cooperation with NASA and the Environmental Research Institute of Michigan. The distribution of organisms within habitat types was determined by field parties from the Auke Bay Fisheries Laboratory (ABFL), with logistical assistance from the Pacific Marine Center. Additional projects included a study of the accumulation of biotic debris in the 'drife zone,' the estimation of variability between sampling areas, and more intensive studies at a few sites which may receive major impact from oil exploration in the eastern Gulf of Alaska. (See also W77-06825) (Sinha-OEIS)
W77-06833

PLANKTON OF THE GULF OF ALASKA - ICHTHYOPLANKTON,
Washington Univ., Seattle. Dept. of Oceanography.
T. S. English.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 269-303, November 1976. 2 fig, 13 tab. 03-5-022-67-TA No. 4.

Descriptors: *Alaska, Water resources, *Data collections, *Resources development, *Environmental effects, *Distribution patterns, *Baseline studies, Ecosystems, Shrimp, Crabs, Plankton.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Gulf of Alaska, Cook Inlet, Ichthyoplankton, Biological collections, Seasonal distribution, Eggs, Larvae.

The main objecti ve was to conduct a quantitative survey to determine the seasonal distribution of commercially or ecosystem important species of ichthyoplankton and shrimp and crab larvae in Lower Cook Inlet, Alaska. Two cruises were undertaken during the summer of 1976. The first was aboard the University of Alaska research vessel ACOMA, from 8-15 July 1976 while the second was aboard the NOAA ship SURVEYOR, from 24-31 August 1976. Zooplankton and ichthyoplankton were sampled with a bongo net in a double oblique tow. Continuous acoustic surveys were conducted. A summary of taxonomic categories of fish eggs, larvae, young and adults found in Bongo nets samples collected on Lower Cook Inlet on a previous cruise in May 1976 is given. (See also W77-06825) (Sinha-OEIS)
W77-06834

INITIAL ZOOPLANKTON INVESTIGATIONS IN LOWER COOK INLET,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
D. M. Damkaer.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 304-314, November 1976. 3 fig, 2 tab.

Descriptors: *Alaska, *Zooplankton, Water resources, *Distribution patterns, *Baseline studies, *Resources development, *Environmental effects, *Data collections, Population, Copepods, Amphipoda, Monitoring, Ecosystems, Seasonal Ecology.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Cook Inlet, Abundance, Euphausids, Chaetognaths.

The seasonal distribution and abundance of zooplankton in selected areas of the Gulf of Alaska, especially Lower Cook Inlet were determined. Particular attention is given to the distributions of copepods (the most abundant net-plankton and the key grazers), amphipods and euphausids (important food for fishes), chaetognaths (key carnivores), larval decapods, and some other groups. All major taxa are enumerated as such whether or not the individual species can be identified. This work should lead to development of a monitoring strategy. Also, it will ultimately contribute to an ecosystem model by defining pathways and amounts of energy or material flow and indicating the relative importance of the several populations. (See also W77-06825) (Sinha-OEIS)

PHYTOPLANKTON AND PRIMARY PRODUCTIVITY IN THE NORTHEAST GULF OF ALASKA,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
J. D. Larrance, and D. A. Tennant.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 315-344, November 1976. 7 fig, 4 tab, 3 ref.

Descriptors: *Alaska, Water resources, *Baseline studies, *Resources development, *Phytoplankton, *Primary productivity, *Environmental effects, *Data collections, Chlorophyll, Nitrates, Distribution patterns.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Gulf of Alaska, Prince William Sound, Cook Inlet, Standing stock.

The time succession of primary production, phytoplankton standing stocks and species during the spring in lower Cook Inlet and Prince William Sound were determined. Much of the data has been reduced and listed in tables. Primary productivity and plant pigments are integrated over depth in the upper layers and daily totals of incident radiation are listed. Nitrate concentrations were selected for discussion because they are most often the critical of the plant nutrients when nutrient limitation of primary production occurs. At most stations, chlorophyll a concentrations and primary production increased between early April and late May, maintained a high level through early July, then decreased to near the early April level by late August. THE MAMMALIAN AND FISH FAUNA OF THE NATURE PRESERVE OF MARTELY, (IN HUNGARIAN),
I. Sterbetz.
Allattani Kozl 62(1-4), p 107-114, 1975.

Descriptors: *Wildlife, *Flood protection, *Environmental effects, *Ecosystems, *Preservation, Mammal groupings, Fish, Dams, Ecotypes, Rivers, Ecology, Forests, Grasslands, Inlets.
Identifiers: *Hungary(Martely), Nature preserve.

Modern flood protection techniques are slowly modifying the botanically and zoologically significant biotope created by the flood dams built on both banks of the Tiza river near Hodmezovasarhely (Hungary) in the late 19th century which contains willow, poplar and oak forests, meadows, inlets and deep depressions. This is why the 2565 ha, 10 km long region was placed under protection in 1952. Notes based on observations of 27 families of mammals and fish between 1947 and 1974 are presented.--Copyright 1976, Biological Abstracts, Inc.

BASELINE STUDIES OF FISH AND SHELLFISH RESOURCES OF NORTON SOUND AND THE SOUTHEASTERN CHUKCHI SEA,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. J. Wolotira, Jr.,, and W. T. Pereyra.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 355-359, November 1976. R7120802.

Descriptors: *Alaska, *Baseline studies, Water resources, *Resources development, *Data collections, *Environmental effects, Fish, Shellfish, Population, Distribution patterns.

Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Norton Sound, *Chukchi Sea, Fishery resources, Demersal fish, Cottidae, Cyclopteridae.

The objectives of this study were to determine the distribution and abundance of fish and shellfish resources in the southern Chukchi Sea and Norton Sound, estimate the productivity, length, weight and age distribution of selected demersal fish and shellfish to develop growth models and to provide a data base against which later changes in these parameters may be compared. Considerable information on demersal and near-surface fish stocks was obtained during Leg I of the FRS MILLER FREEMAN Cruise 76B in Norton Sound and the Chukchi Sea. One hundred seventy-four of the entire survey's 240 demersal trawling sites were examined with bottom trawls during September 1976, completing all scheduled sampling in Kitzebue Sound and the Chukchi Sea as well as most of Norton Sound. In addition to completing the trawl stations, 22 gillnet sets were performed. Nearly 50 tentatively identified fish species were encountered during Leg I. Of the 162 preserved amples over half contained members of the family Cottidae. Most of the remaining samples included specimens of the families Cyclopteridae (snailfishes) and Zoarcidae (eelpouts). BEAUFORT SEA ESTUARINE FISHERY STUDY,
Alaska Dept. of Fish and Game, Fairbanks. Div. of Sport Fish.
T. M. Bendock.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 360-362, November 1976. 03-5-022-69.

Descriptors: *Alaska, *Estuaries, Water resources, *Baseline studies, *Resources development, *Environmental effects, *Data collections, Fisheries, Ecology, Distribution patterns.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Beaufort Sea, Anadromous fishes.

Field activities during the summer of 1976 were directed towards identifying the migration patterns, timing of movements and seasonal abundances of Beaufort Sea fish in the vicinity of Prudhoe Bay and along the Beaufort Sea coast and barrier islands westward to the Colville River. Thirty sampling and recapture stations were monitored along the westward coastal area and barrier islands and two stations were monitored in the lower Sagavanirktok River. Other tasks include identifying critical habitats including spawning, overwintering, feeding, rearing and migration areas; determining the interrelationship of Arctic fishes to lower food-web organisms; and determining the present rate of exploitation of the anadromous fishes of the area and monitoring changes in this usage as development of the area's petroleum resource progresses. THE DISTRIBUTION, ABUNDANCE, DIVERSITY, AND PRODUCTIVITY OF BENTHIC ORGANISMS IN THE GULF OF ALASKA,
Alaska Univ., College. Inst. of Marine Science.
H. M. Feder.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 363-415, November 1976. 13 fig, 4 tab, 28 ref, append. 03-5-022-56.

Descriptors: *Alaska, *Baseline studies, *Resources development, *Benthos, *Environmental effects, *Distribution patterns, *Productivity, Data collections, Ecosystems, Biota.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Gulf of Alaska, Epibenthic biota.

A preliminary, but detailed, examination of the trawl data collection in the north Pacific on the M/V NORTH PACIFIC in the summer of 1975 was made. This assessment of data was included in a paper presented at the Alaska Science Conference in August 1976; the manuscript is attached as an appendix. A qualitative and quantitative inventory census of dominant epibenthic invertebrates was examined from the northeast Gulf of Alaska. Subsequent taxonomic analysis delineated 168 species with the molluscs, crustaceans and echinoderms dominating in species representation with 47, 42, and 36 species taken respectively in each group. Mulluscs were represented by 28 families. A description of the spatial patterns of selected species is presented with emphasis on assessing patchiness and correlation with habitat. (See also W77-06825) (Sinha-OEIS)
W77-06841

FOOD AND FEEDING RELATIONSHIPS IN THE BENTHIC AND DEMERSAL FISHES OF THE GULF OF ALASKA AND BERING SEA,
Alaska Univ., College. Inst. of Marine Science.
R. L. Smith.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 418-425, November 1976. 03-5-022-56.

Descriptors: *Alaska, *Benthos, *Baseline studies, *Resources development, Water resources, *Environmental effects, Data collections, Food, Feeding habits, Ecology, Computer programs.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Bering Sea, *Gulf of Alaska, Demersal fish.

Tasks for this quarter included a continuation of very limited archival procedures on recently acquired Bering Sea samples, completion of preliminary sorts on five target species and devising a computer program for analysis of data. Laboratory activities were centered around completing gut analyses for the three Gulf of Alaska species and two Bering Sea species. (See also W77-06825) (Sinha-OEIS)

RECONNAISSANCE CHARACTERIZATION OF LITTORAL BIOTA, BEAUFORT AND CHUKCHI SEAS,
Western Washington State Coll., Bellingham.
A. C. Broad.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 437-455, November 1976. 1 tab. 03-5-022-81.

Descriptors: *Alaska, *Baseline studies, *Aquatic life, *Resources development, *Environmental effects. Water resource, Data collections, Surveys, Littoral, Biota, Coasts.
Identifiers: *Outer Continental, *Environmental assessment, *Environmental impact, *Beaufort Sea, *Chukchi Sea, Biological collections, Arctic, Environmental survey.

The shoreline of the Beaufort Sea is unconsolidated and is comprised largely of pebble or sand and pebble beaches. There is virtually no shoal water or intertidal attached macrobenthos, but there sometimes are large numbers of smaller, invertebrates (mainly annelid worms) in the bottom sediments, and there are nearly always very large numbers of amphipods present everywhere. At depths in excess of 2 m in the lagoons as well as in the sea bivalve molluscs are common and polychaete worms are virtually ubiquitous. The Arctic littoral ecosystem receives significant contributions from the essentially terrestrial vegetation of beaches and tundra banks and is inseparable from it. Periodic wind-induced fluctuations in local sea level result in innundation of much of the low-lying land. The plant communities in these marshy areas are affected by the sea and are also important in the feeding of geese. The degree to which the Arctic littoral is a detritus-based ecosystem bears further study. (See also W77-06825) (Sinha-OEIS)
W77-06843

ICHTHYOPLANKTON OF THE EASTERN BERING SEA,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
F. Favorite, and K. D. Waldron.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 483-486, November 1976. 1 fig.

Descriptors: *Plankton, *Baseline studies, *Alaska, *Resources development, *Environmental effects, *Larvae, Water resources, Data collections, Surveys.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, Ichthyoplankton, Biological collections, *Bering Sea, Theragra chalcogramma, Teinhardtius hippoglossoides, Atheresthes stomias, Hippoglossus stenolepis.

Ichthyoplankton samples from a portion of the eastern Bering Sea were collected and analyzed. Ichthyoplankton from the 505 bongo and the neuston samples were received at the Northwest Fisheries Center during the first week of September and identification was begun. The samples were from the continental slope west of the Pribiliof Islands and from one station near Unimak Pass. The predominant species from these stations was walleye pollock. Larvae of other fish of commercial importance includes those of Greenland turbot, arrowtooth flounder, and Pacific halibut. Capture of halibut larvae is of interest because they have been reported infrequently from the eastern Bering Sea. (See also W77-06825) (Sinha-OEIS)
W77-06845

ASSESSMENT OF PELAGIC AND NEARSHORE FISH IN THREE BAYS ON SOUTHEAST KODIAK ISLAND,
Washington Univ., Seattle. Fisheries Research Inst.
C. K. Harris, and A. C. Hartt.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 487-510, November 1976. 3 fig, 5 tab.

Descriptors: *Alaska, *Fishes, *Baseline studies, Water resources, *Resources development, *Data collections, *Environmental development, Ecology, Distribution patterns, Migrations, Surveys, Bays.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Kodiak Island(Alas), Stock assessment.

This quarterly progress report covers the last two sampling sessions of the pelagic and nearshore fish survey of Ugak, Kaiugnak, and Alitak bays on southeast Kodiak Island, Alaska. One of the findings of the study is that while all three bays have numerous species in the pelagic zone, only a few are regularly abundant. Capelin, sandfish, and to a lesser extent sandlace and pink salmon comprise a major fraction of the pelagic fish community. Almost all species in the pelagic zone were

overwhelmingly represented by larval or juvenile stages which suggests that the pelagic areas of the bays are nursery areas for fish which reside as adults in benthic, littoral, or oceanic habitats. There are indications of patchy or localized distributions within the study area. The pink salmon especially, deserves special mention in this regard because of their immense economic importance to the Kodiak region. (See also W77-06825) (Sinha-OEIS)
W77-06846

DEMERSAL FISH AND SHELLFISH ASSESSMENT IN SELECTED ESTUARY SYSTEMS OF KODIAK ISLAND,
Alaska Dept. of Fish and Game, Kodiak.
J. E. Blackburn.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 511-520, November 1976. 5 fig, 1 tab.

Descriptors: *Alaska, *Fishes, *Shellfish, *Distribution patterns, *Baseline studies, *Resources development, *Environmental effects, Water resources, Data collections, Surveys, Ecology.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Kodiak Island(Alas), Stock assessment, Demersal fish.

This report presents the activities and a preliminary statement of results obtained on demersal fish and shellfish assessment from July 1 through September 30, 1976. Catches in both Ugak and Alitak Bays consisted almost entirely of crustaceans, flounders, sculpins and cod. There were considerable differences in the catch between the bays. In Ugak Bay the mean total catch was greater in each month. The catch of fish within both Ugak and Alitak Bays tended to be greatest near the mouth and decrease further within the bay. The catch of crustaceans within each bay did not show a trend of abundance along the length of the bay. King crab were virtually never captured in Deadman Bay while they were taken at nearly every other station in Alitak Bay each month. (See also W77-06825) (Sinha-OEIS)
W77-06847

TECHNICAL TRAWL SURVEY OF THE BENTHIC EPIFAUNA OF THE CHUKCHI SEA AND NORTON SOUND.
Alaska Univ., College. O.C.S. Coordination Office.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 521-526, November 1976. 03-5-022-56.

Descriptors: *Alaska, *Baseline studies, Invertebrates, *Resources development, Environmental effects, Water resources, Data collections, Surveys, Distribution patterns, Benthos, Biota.
Identifiers: *Outer Continental Shelf, Environmental assessment, *Environmental impact, *Chukchi Sea, *Norton Sound(Alas), Epibenthic invertebrates, Biological collections, Cruise reports.

Enumeration and gravimetric determination of the epibenthic invertebrates of Chukchi Sea and segments of Norton Sound was made on Leg I of MILLER FREEMAN cruise 76-B. Invertebrate data was obtained from 136 stations. Although large concentrations of invertebrates were encountered, no economically important species were found in commercial quantities. The asteroids (sea stars) were the most conspicuous members of the invertebrate biomass with nine species encountered and four species dominating. In addition to the qualitative and quantitative inventory census of benthis invertebrate ipifaunal species, preliminary observations of biological interrelationships between selected segments of the benthic biota was made. (See also W77-06825) (Sinha-OEIS)

THE DISTRIBUTION, ABUNDANCE AND DIVERSITY OF THE EPIFAUNAL BENTHIC ORGANISMS IN TWO (ALITAK AND UGAK) BAYS OF KODIAK ISLAND, ALASKA,
Alaska Univ., College Inst. of Marine Science.
H. M. Feder.
In: Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports for the Quarter Ending Sept. 1976, Vol 2. Fish, Plankton, Benthos, Littoral, p 527-530, November 1976. 03-5-022-56.

Descriptors: *Alaska, *Benthos, *Distribution patterns, *Ecology, *Surveys, *Invertebrates, Water resources, *Baseline studies, *Resources development, *Environmental effects, Data collections, Biomass, Coasts, Pollutant identification, Bays.
Identifiers: *Outer Continental Shelf, *Environmental assessment, *Environmental impact, *Kodiak Island(Alas).

Invertebrates were identified to the lowest taxon with numbers and weights normally assigned to each taxon. Approximately 95% of the invertebrate biomass and species consisted of Chionecetes bairdi, Paralithodes camtschatica, Pandalus borealis and Pandalus hypsinotus. Unidentified organisms were preserved for later identification. Some observations of biological interrelationships between segments of the benthic biota were made, i.e., feeding observations on commercial crab and demersal fishes. Also, reproductive conditions of selected crabs and shrimps were noted. Pollutants were recorded in four stations. (See also W77-06825) (Sinha-OEIS)

PROGRAM DEVELOPMENT PLAN. ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF,
National Oceanic and Atmospheric Administration, Washington, D.C.
December 1976. 263 p, 15 fig, 4 tab, 2 append. NOAA-BLM Basic Interagency Agreement No. AA550-BA7-4.

Descriptors: *Alaska, Baseline studies, *Continental Shelf, Legislation, Leases, Resources development, Oil industry, Environmental effects.
Identifiers: *Outer Continental Shelf, *Environmental assessment, Research programs.

This document is the Program Development Plan for the Alaskan Outer Continental Shelf environmental studies being managed by the National Oceanic and Atmospheric Administration (NOAA) for the Bureau of Land Management. Part III describes the goals and objectives for the OCSEA program. Part IV is organized in a logical engineering program sequence including general approach, user needs, sites of work, related work past and present, the types of studies included in the program, considerations in setting priorities, definition of specific tasks, methods for handling, intergrating, and synthesizing the data, and finally definitions of the end products or 'deliverables'. Parts V and VI detail the study schedules tied to user needs, and the management structure, established to provide the study products in a usable and timely manner. Appendixes provide essential background material on each geographic lease area, and interagency agreements. (NOAA)

GUIDELINES FOR THE PREPARATION OF ENVIRONMENTAL REPORTS FOR FOSSIL-FUELED STEAM ELECTRIC GENERATING STATIONS,
United Engineers and Constructors, Inc., Philadelphia, Pa.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 071, Price codes: A08 in paper copy, A01 in microfiche. Compleion Report, November 1976. 166 p, 54 ref. OWRT C-6531(No. 5238)(1).

Descriptors: *Environmental effects, *Thermal power plants, Electric power plants, *Steam, *Fossil fuels, Electric power demand, Electric power production, Waste treatment, Thermal pollution, Air pollution, Operations, Performance, Standards.
Identifiers: *Environmental impact statements.

Described are the many types of information which should be assembled into an Environmental Report (ER) by an Applicant who proposes to construct a fossil-fueled electrical generating unit and who requires a grant, license, permit or approval from a Federal Agency. The resulting ER would serve as the Applicant's input from which the Federal Lead Agency would prepare an Environmental Impact Statement (EIS). The EIS is required by the National Environmental Policy Act of 1969 (NEPA) when a Federal Agency proposes taking a major federal action significantly affecting the quality of the human environment. The report contains the following chapter headings: Introduction to the Project; Need for the Proposed Facility; Major Alternatives Considered for the Project; Project Description; Alternate Design of Plant Facilities; Mitigation Measures of the Project; Project Evaluation Summary; Applicable Licenses, Permits and Approvals; Environmental Impact and Effects of the Project; Adverse Environmental Effects which Cannot Be Avoided; Relationship of Short Term Use of the Environment and Long-Term Productivity; Resources Committed During Plant Construction and Operation; Environmental Effects and Impacts of Alternatives; Consultations, Conferences and Meetings; Appendices; and References.

STATE INFORMATION NEEDS RELATED TO ONSHORE AND NEARSHORE EFFECTS OF OCS PETROLEUM DEVELOPMENT,
D. C. Williams.
NOAA, Office of Coastal Zone Management and Bureau of Land Management Joint Report on State Information Needs Related to Onshore and Nearshore Effects of OCS Petroleum Development, January 1977. 193 p, 5 maps, 3 append.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Resources development, *Baseline studies, *Environmental effects, Water resources, Coasts, Oil industry, State governments, Local governments, Information exchange, Oil pollution.
Identifiers: *Outer Continental Shelf, *Coastal zone management.

The study conducted in cooperation with coastal States in the summer of 1976, by the Bureau of Land Management, and the Office of Coastal Zone Management, NOAA provides useful information for local, State and Federal officials, the petroleum and offshore development industries, and other groups. There are three sections: The National Analysis, derived from the responses of 22 States, was designed to array nationally significant OSC related State information needs within the context of the States' OCS policies and concerns, current information and State-local relationships in OCS impact planning; The Regional Analysis section identified the findings on specific information needs and variations of the five OCS leasing regions covered by the study; and the Conclusions were drawn from the study findings. Recommendations were made for responsive actions by Federal and State agencies, industry and other interested groups. Appendices include the summaries of the individual State responses, the framework documents of the study and a list of the attendees of the meetings with the States. (NOAA)

COASTAL FACILITY GUIDELINES: A METHODOLOGY FOR DEVELOPMENT WITH ENVIRONMENTAL CASE STUDIES ON MARINAS AND POWER PLANTS,
National Oceanic and Atmospheric Administration, Rockville, Md. Office of Coastal Zone Management.
Working Paper, August 1976. 161 p, 4 append.

Descriptors: Coasts, *Florida, Maryland, Marinas, Powerplants, Resources development, Facilities, *Environmental effects, Water pollution effects, Ecosystems.
Identifiers: Coastal zone management, Guidelines, Environmental impact.

This report provides state coastal zone management (CZM) agencies with information and recommendations for developing guidelines for facility development in the coastal zone. Section A of the report presents a methodology for identifying and initiating implementation procedures for management recommendations for specific facility types. Section B and C apply the methodology to marinas and power plants in the states of Florida and Maryland, respectively. The two case studies from Florida and Maryland serve the dual purpose of (1) providing a useful CZM refernce source on enviromental mitigation techniques and relevant Federal authorities for the two facility types and (2) further clarifying the format, intended information content, and applications envisioned in the methodology. (NOAA)

ENVIRONMENTAL POLLUTION: IS THERE ENOUGH PUBLIC CONCERN TO LEAD TO ACTION,
Illinois Univ. at Urbana-Champaign.
N. C. Sharma, J. E. Kivlin, and F. C. Fliegel.
Environment and Behavior, Vol. 7, No. 4, December 1975, p 455-471. 1 fig, 1 tab, 21 ref.

Descriptors: *Water quality, *Attitudes, *Social aspects, *Decision-making, *Information exchange, *Political aspects, *Environmental quality, *Illinois, *Social participation, Pollution, Employment.
Identifiers: *Public participation, *Communication channels, Socio-economic status.

A town of 3,000 inhabitants, located in northern Illinois, was studied to discover the extent to which the public was informed, what the public thought of alternative solutions, and generally, the problem solving process in the community when faced with a severe pollution problem. A large meat packing plant was polluting the river which ran through the town. Employing 400 people, it was the most important employer in the town. Pollution attitudes of the residents were analyzed to determine which groups were willing to accept the pollution or were willing to accept the economic consequences of closing the plant. Forty-two percent of the survey respondents favored closing the industry, 58% chose to accept the current pollution level. A 4 stage causal model is presented relating attitudes toward pollution with a number of variables, among which were socioeconomic status, age, length of residence in the community, communication channel usage, and personal interaction in the community. The first stage found significant positive correlations between the willingness to close the plant and discussion with family and friends (rather than drawing from media information or voting activity), negative attitudes toward pollution, and the higher occupational prestige of the respondent. Older people and young people who have not long resided in the community were more tolerant of pollution than young long-time residents. The results show that the political process and involvement in it are not effective in generating anti-pollution sentiment. Reliance on discussion with family and friends to generate anti-pollution sentiment suggests that a grass-roots movement may eventually emerge to combat pollution. (Gentry-North Carolina)

ENERGY DEVELOPMENT: THE ENVIRONMENTAL TRADEOFFS. VOLUME 4: THE BACKGROUND PAPERS,
Stanford Research Inst., Menlo Park, Calif.
M. D. Levine, R. V. Steele, and I. W. Yabroff.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 003, Price codes: A07 in paper copy, A01 in microfiche. Prepared for the U.S. Environmental Protection Agency, Washington, D.C., Office of Planning and Evaluation, October 1975. 122 p, 12 fig, 28 tab. 68-01-2469.

Descriptors: *Colorado River Basin, *Missouri River Basin, *Energy, Technology, *Air pollution, *Water pollution, *Social aspects, *Oil shale, Environmental effects, Recycling, Watersheds(Basins).
Identifiers: *Energy development, *Coal liquefication, *Coal conversion, *Lurgi process, Synthane process.

Background information is presented to provide detailed assessment of selected social and environmental impacts associated with general energy development as well as impacts resulting from specific technology used. A state-of-the-art view of energy conversion technologies is given; e.g., two techniques for increasing production of electricity from western coal are direct burning of coal to produce steam, and low Btu gasification of coal; technologies for increasing liquid fuel supplies are recovery of oil from shale, coal liquefication, oil and gas recovery from the outer continental shelf, and gas produced through use of assisted recovery; technologies for producing pipeline gas from coal now involve the Lurgi process; synthane process is promising. The social impacts of energy development in rural areas arise principally due to population increases and urbanization, with subsequent demands for housing, health services and education. Barriers to solving social problems in boom towns are absence of city planners and lack of planning expertise in city councils or other governmental agencies. Effects of energy development on non-energy uses and instream flow levels in the upper Colorado and Missouri River basins appear to be major. Conclusions concerning water quality impacts of oil shale and coal conversion processes are: direct discharge of contaminated water into streams and reservoirs can be minimized by using evaporation ponds, treating and recycling waste water, underground injection of excess water and providing catchment dams. Air pollution varies among conversion technologies and final use of the energy resource. (See also W76-13039) (Gentry-North Carolina)

Agricultural watersheds, Evapotranspiration, Sampling, Instrumentation.
Identifiers: *Germanium diodes, *Vapor pressure gradients, *Quebec, Humidity profile, Temperature sensors, Sampling array, Temperature profile, Diodes, Dry-bulb temperature, Wet-bulb temperature.

The measurement of accurate air temperature and humidity profiles is fairly routine over agricultural surfaces where the roughness seldom exceeded 2 m in height. In most cases, the sensors are easily accessible, and routine maintenance is simple. Over forests, however, where the roughness elements are several tens of meters in height, accessibility is a major problem, and routine maintenance of the sensors is difficult. A sampling array was described for the measurement of temperature and humidity profiles, using diodes as temperature sensors, above a 15 m balsam fir canopy at Montmorency, Quebec. There were six levels of measurement of dry-bulb and wet-bulb temperature (14.4, 15.15, 16.15, 17.4, 18.4, and 19.8 m). The array was mounted on a 21.3 m television tower. The system was thoroughly tested in the summer of 1974 as part of an energy balance study. The system proved to be very satisfactory. The very small temperature and vapor pressure gradients characteristically found over forests were successfully resolved. (Roberts-ISWS)

A STUDY OF THE UTILIZATION OF EREP DATA FROM THE WABASH RIVER BASIN,
Purdue Univ., Lafayette, Ind. Lab for Applications of Remote Sensing.
L. F. Silva.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-19508, Price codes: A08 in paper copy, A01 in microfiche. Final Report, Project SR397, 1976. 143 p, 48 fig, 53 tab, 28 ref, 1 append. NASA NAS9-13301, NASA NGL15-005-112.

Descriptors: *Remote sensing, *Satellites(Artificial), *Instrumentation, *Indiana, Vegetation, Crops, Forests, *Land use, Water resources, Cities, Urbanization, Atmosphere, Classification, Soil classification, Analytical techniques, Radiation, Photography.
Identifiers: *Skylab, *LANDSAT, *Wabash River Basin(Ind).

Data from the Earth Resource Experiment Package (EREP) on Skylab were used to study the utilization of these data in the Wabash River Basin. The study of the spacecraft multispectral data sets indicated that better land use delineation using machine processing techniques can be obtained with data from multispectral scanners than digitized S190A photographic sensor data. Better results were obtained for both a late spring scene and, to a much more significant degree, a winter scene. Comparable results were obtained from the LANDSAT 1 and Skylab S192 scanners for the late spring scene even though the S192 scanner contained channels with a broader spectral range and smaller spectral resolutions. The results of the multi-emulsion photographic data set were a little better than the multiband photographic data set. The results of the comparison of the interim and filtered S192 data indicated that the data were improved some for machine processing techniques. It is questionable, however, whether the improvement obtained was worth the time and resources spent in the filtering effort. The results of the S192 X-5 detector array studies over a wintertime scene indicated that a good quality far infrared channel can be very useful. The results of the S191 spectroradiometer study indicated that the data from the S191 was usable, and it was possible to estimate the path radiance. The results of the channel significance study indicated that channel 11, a middle infrared band, was very useful in all three data sets. Based on these studies, it was recommended that future space earth resource systems include multispectral scanners which contain channels in the middle infrared and the far infrared in addition to channels in the visible and near infrared. A DEVICE FOR MEASURING SEEPAGE FLUX IN LAKES AND ESTUARIES,
Waterloo Univ. (Ontario). Dept. of Earth Sciences.
D. R. Lee.
Limnology and Oceanography, Vol 22, No 1, p 140-147, January 1977. 8 fig, 2 tab, 14 ref.

Descriptors: *Seepage, *Estuaries, *Instrumentation, *Wisconsin, *Minnesota, *North Carolina, Lakes, Laboratory tests, Groundwater, Permeability, Water, Wells, Observation wells, Benthic fauna, Plastics.
Identifiers: *Seepage flux, *Hydraulic head, *Nova Scotia, Seepage inflow, Seepage velocity, Seepage cylinder.

Seepage flux can be measured and samples of groundwater flowing into lakes and estuaries can be collected by enclosing an area of bottom with a cylinder vented to a plastic bag. The method has the advantage of not requiring measurements of permeability of bottom sediments. Seepage velocities from -0.1-2.58 micrometer/s were measured in Minnesota and Wisconsin lakes and in Nova Scotia and North Carolina estuaries. Where seepage inflow was rapid (0.4-0.8 micrometer/s), water collected with the seepage meter was chemically similar to water from wells on the same flow path, and the distribution and chemistry of the seepage concurred with the theoretical flow net. The rate and direction of seepage flux were correlated with water surface elevation during a tidal cycle. (Roberts-ISWS)

A UNIVERSAL CALIBRATION EQUATION FOR PRICE METERS AND SIMILAR INSTRUMENTS,
Canada Centre for Inland Waters, Burlington (Ontario).
P. Engel.
Scientific Series No. 65, 1976, 12 p., 12 fig., 2 tab, 7 ref.

Descriptors: *Measurement, *Instrumentation, *Equations, Costs, Velocity, Fluid properties, Saline water, Freshwater, Streamflow, *Calibration.
Identifiers: *Price current meters, Fluid density, Calibration accuracy.

A universal calibration curve has been developed using theoretical and empirical methods. The analysis shows that for a meter of given rotor diameter and fixed frictional resistance, the rate of rotation of the meter rotor is dependent only on the speed of the fluid and the fluid density. Changes in temperature and small changes in density as experienced when changing from fresh water to salt water do not have a significant effect on measure-

LIBRARY U. OF I. URBANA-CHAMPAIGN

ment accuracy. A practical form of the calibration equation is given. Suggestions are made for applying the universal calibration equation to calibrations of current meters in wind tunnels. The principles developed can be applied to other current meters used in oceanographic and lake surveys as well as anemometers used to measure wind velocities. (WATDOC)

MEASUREMENT IN A MARINE ENVIRONMENT USING LOW COST SENSORS OF TEMPERATURE AND DISSOLVED OXYGEN,
National Oceanic and Atmospheric Administration, Washington, D.C. Environmental Data Service; and Geological Survey, Edgewater, Md. Water Resources Div.
F. A. Godshall, R. L. Cory, and D. E. Phinney.
Chesapeake Science, Vol 15, No 3, p 178-181, September 1974. 5 fig, 5 ref.

Descriptors: *Dissolved oxygen, *Water temperature, *Chesapeake Bay, *Estuaries, *Analytical techniques, Sampling, On-site data collections, Costs, Research equipment, Evaluation, *Maryland, *Measurement, Instrumentation.
Identifiers: *Chemical thermometers, Rhode River(Md).

Continuous records of physical parameters of the marine environment are difficult as well as expensive to obtain. This paper describes preliminary results of an investigative program with the purpose of developing low cost time integrating measurement and averaging devices for water temperature and dissolved oxygen. Measurements were made in an estuarine area of the Chesapeake Bay over two week periods. With chemical thermometers average water temperature for the two week period was found to be equal to average water temperature measured with thermocouples plus or minus 1.0 C. The slow diffusion of oxygen through the semipermiable sides of plastic bottles permitted the use of water filled bottles to obtain averaged oxygen measurements. Oxygen measurements for two week averaging times using 500 ml polyethylne bottles were found to vary from conventionally measured and averaged dissolved oxygen by about 1.8 mg/liter. (Woodard-USGS)

SMOOTHING DATA WITH CUBIC SPLINES,
Agricultural Research Service, Phoenix, Ari. Water Conservation Lab.
B. A. Kimball.
Agron J, (68) p 126-129. 1976.

Descriptors: *Statistical methods, *Statistic *Soil moisture, *Mathematical studies, Samplin Equations, Moisture content, Data collection Agronomy, *Data processing.
Identifiers: *Cubic splines, *Mathematic smoothing.

Agronomic data frequently requires smoothing order to obtain a reliable functional relationsh for interpolating, predicting or determining t rate of change of one variable with respect another. To test whether cubic spline functio could provide satisfactory smoothing, the necess ry equations were derived, computer progra written, and several sets of soil temperature a water content data were smoothed. Cubic spli smoothing displayed the following advantage Because spline functions are defined piecewis they can represent any variable arbitrarily w over wide ranges of the other. The data can be o tained at unequal intervals, so high sampling ra can be used where changes are rapid and low ra where they are slow. Additionally, the gradie derived from cubic spline functions are smoot joined parabolas, not the abruptly join straightline segments characteristic of parabo spline smoothing.--Copyright 1976, Biological A stracts, Inc.

Identifiers: *Clinton quadrangle(Okla).

This 4-sheet atlas describes surface and groundwater conditions in the Clinton quadrangle which encompasses the red-bed plains of west-central Oklahoma. The mean annual precipitation ranges from about 22 inches in the west to about 30 inches in the east. High mineralization makes water from most streams in the quadrangle unsuitable for municipal use during low-flow periods. Gypsum and halite from natural sources are the principal causes of mineralization. The amount of water used during 1971 for municipal, industrial, rural-domestic, and irrigation purposes is estimated at 36 billion gallons. Irrigation accounted for 33.2 billion gallons; municipal and industrial demand accounted for 1.8 billion gallons; and rural-domestic use accounted for about 1.0 billion gallons. Ground water is the major source of water used in the quadrangle. Ground-water withdrawal for irrigation amounted to 28.9 billion gallons, or 87 percent of the total irrigation water used. More than 75 percent, 1.4 billion gallons, of the water used for municipal and industrial purposes was taken from ground-water sources. Rural-domestic use accounted for withdrawal of an additional 1.0 billion gallons of ground water. (Woodard-USGS)

COST COMPARISON BETWEEN SUBTERRENE AND CURRENT TUNNELING METHODS,
Mathews (A. A.), Inc., Rockville, Md.
J. D. Bledsoe, J. E. Hill, and R. F. Coon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-244 481, Price codes: A05 in paper copy, A01 in microfiche. Report NSF-RA-T-75-001, May 1975. 96 p, 6 fig, 21 tab, 23 ref. NSF-C840.

Descriptors: *Tunneling, *Tunneling machines, *Cost analysis, *California, *Cost comparisons, Tunnel construction, Drilling, Tunnel linings, Underground structures, Excavation, Rock excavation, Costs, Construction, Construction costs, Construction equipment, Civil engineering.
Identifiers: *Thermal tunneling, Subterrene.

A study was made to compare tunnel construction costs between the Subterrene tunneling system and methods currently in use. Three completed tunnels were selected for study cases to represent finished diameters ranging from 3.05 m (10 ft) to 6.25 m (20.5 ft). The study cases were normalized by deleting extraneous work and assigning labor, equipment, and materials costs for the Southern California area in 1974. Detailed cost estimates (shown in Appendix A) were then made for the three tunnels for baselines. A conceptual nuclear powered Subterrene tunneling machine (NSTM) was designed. It was assumed that NSTM's were available for each of the three baseline tunnels. Costs were estimated (shown in Appendix B) for the baseline tunnels driven by NSTM. Savings of 12% for the 4.73 m (15.5 ft) tunnel and 6% for the 6.25 m (20.5 ft) tunnel were found to be possible using the NSTM as compared to current methods. A penalty of 30% was found for the 3.05 m (10 ft) tunnel using the NSTM. The cost advantage for the NSTM results from the combination of (1) a capital rather than labor intensive system, and (2) formation of both initial support and final lining in conjunction with the excavation process. (See W77-06663 and W77-06664) (Sims-ISWS)

NEW DESIGN GIVES DENVER DISTRICT IRON-FREE WELL,
Wright Water Engineers, Inc., Denver, Colo.
T. L. Decker, and R. E. Darr.
The Johnson Drillers Journal, Vol 49, No 1, p 5-8, January-February, 1977. 5 fig.

Descriptors: *Water wells, *Corrosion, *Iron bacteria, Construction materials, Stainless steel, Well casings, Logging(Recording), Well screens, Drilling, Aquifers, *Colorado.
Identifiers: *Fiberglass well casing, Non-corrosive materials, Denver Basin, Gravel packs, Shaw Heights Water District, *Denver(Colorado).

The Shaw Heights Water District in Colorado recently constructed a replacement well with both casing and well screen made entirely of corrosion-resistant materials. Out of eight deep wells purchased by the district in 1968 only one remained operational by 1975. The other seven wells were dropped out of service from time to time as yields of water quality deteriorated. The primary problem was the increasing iron content of the water. Although iron bacteria had not been specifically identified, their presence was suspected. Evidence pointed to a pickup of iron from the steel casing and slotted pipe as the cause of the increased iron content. Increased corrosion rates appeared to result from bacterial activity and alternating reducing-oxidizing conditions caused by pumping schedules. Iron bacteria probably were inadvertently introduced into the wells when installing test pumps or changing pumping equipment that was contaminated at another location. The replacement well was a gravel pack design utilizing 150 feet of 8 inch stainless steel screen. The well was completed to a depth of 664 feet. Seven inch fiberglass casing in 30 foot joints, with 0.5 inch thickness were installed. Rates as high as 80 gpm were used to develop the well during 5 1/2 days of pumping over 250,000 gallons of water. Just prior to termination of the pumping test a water sample contained total dissolved solids of 445 ppm. The iron contest was 0.05 ppm, well below that of other local wells in the same aquifer. HYDRAULICS AND ECONOMICS OF WELL FIELD LAYOUT.
Universal Oil Products, St. Paul, Minn. Johnson Div.
Public Works, Vol 108, No 1, p 40-41, January, 1977, 3 fig, 3 ref.

Descriptors: *Pumping, *Drawdown, Hydraulics, Aquifers, *Economic efficiency, Water wells, Economics, Costs.
Identifiers: *Water well field, *Multiple wells, Well yield, Well diameter, Well interference.

Although decisions based on economics alone will frequently favor the drilling of a single well of large yield as opposed to multiple wells of limited yield, the principl of hydraulics often suggest the opposite conclusion. In an extensive aquifer, a ring of wells equidistantly spaced has nearly the same performance effects as one very large well at the center of the ring. For example, one analysis of a ring of eight 12-inch wells on a circle of 1,000 feet diameter showed the theoretical performance of a single well 550 feet in diameter discharging at a rate equal to the composite yield of the smaller wells. In general, a multiple well system is more favorable in thin aquifers and in finer sand formations, or situations where transmissivity varies with both thickness and permeability of the sand formation. In water-bearing formations of considerable thickness (50 feet or more) a single high capacity well may be preferred. (Eberle-NWWA)

HYDRAULICS OF SHEET FLOW IN WETLANDS,
Florida Univ., Gainesville. Dept. of Civil Engineering.
B. A. Christensen.
Reprinted from: Proceedings of ASCE Symposium on Inland Waters for Navigation, Flood Control and Water Diversions held at Colorado State University, Aug 10-12, 1976. p 746-759, 4 fig, 10 ref.

Descriptors: Hydraulics, *Wetlands, *Sheet flow, *Forecasting, *Flood plains, Mannings equation, Vegetation, Equations, Overland flow.
Identifiers: Hydrodynamic drag.

The numerical prediction of sheet flow behavior in wetlands and flood plains is usually handled by use of the Manning equation. However, a successful use of that formula requires a reasonably accurate estimate of Manning's n for such usually heavily vegetated areas. This is, in most cases, an impossible, or nearly impossible task which adds a substantial amount of uncertainties to this approach. Observations also tend to indicate that Manning's n should be a function not only of the type and degree of vegetation but also of the flow depth indicating that another power formula or a modified form of the Manning formula might be better than the classic Manning formula for describing this type of flow. Such an expression is developed in the present paper by considering the velocity distribution in overland flow in the turbulent rough flow range, i.e., for wall Reynolds' numbers in excess of seventy, and considering the equilibrium of forces in the direction of the flow taking the hydrodynamic drag on the vegetation into consideration. Descriptors: *Pumps, *Electric motors, *Water wells.
Identifiers: *Jet pumps, Motor nameplates.

Pump nameplates furnish the dealer or installer with vital information concerning the operation of the unit. Usually included are data such as diagrams for hook-up to proper voltage, whether or not there is a thermal cutoff device, Canadian Standards Association insignia if unit is approved for installation in Canada, model and serial numbers, nominal HP of motor, amps, single or three-phase designation, RPMs, motor frame size, service factor (indicates permissible horsepower loading), class of insulation and maximum ambient temperature, electrical type (relative to starting), locked rotor KVA per horsepower rating, and UL approval. PUMPING SYSTEMS: THE SIMPLER, THE BETTER,
Plummer and McDannald Drilling Co. Galena, Ohio.
R. B. McDannald.
Water Well Journal, Vol. 31, No. 3, p 30-31, March, 1977.

Descriptors: *Pumps, *Hydraulic systems, *Corrosion, *Electrical equipment, Performance, Capacitors, Electrical motors, Electric wires, Electrolysis, Water wells, Plastic pipes.
Identifiers: *Submersible pumps, Electrical connections, Pumping system design.

Simple water pumping systems are superior in maintenance, frequency and life of system. The basic components of pumping systems are: the pump motor, the motor electrical system, the pump components housings, impellers, shafts, bearings and pump casing. Applications usually dictate the type of pump used. Motor differences such as capacitor start-capacitor run of capacitor start-winding run types dictate the application. The materials used in the construction of pump components are critical due to the corrosive environmental in which the pump may operate. Stainless steel, brass or plastic seem to resist corrosion better than other materials. The connection between the pump and the drop pipe is vulnerable to corrosion if two different types of metal are used together, for example galvanized steel connected to brass. PVC nipple spacers should be

used as connections to preclude connection corrosion. All PVC drop pipe may be used in these cases also. Wiring connections should be made with properly applied electrical tape. Wiring should be of sufficient length to accommodate 'growth' or stretch of the drop pipe after installation.

ONE GOOD IDEA SPURS ANOTHER.
Ground Water Age, Vol 11, No 5, p 21-22, January, 1977. 1 fig.

Descriptors: *Drilling equipment, Well drilling, *Rotary drilling, Water wells.
Identifiers: *Drilling pipe clamps, Time saving innovations, Equipment installation tools.

Two innovative rotary drilling devices designed specifically to speed up well drilling operations were invented and introduced by the Eastwood Drilling company. The pipe holder, mounted on the drilling rig, consists of four 'Slips' of case hardened, high tensile steel, with multiple sharpened horizontal grooves. The holder locks a length of pipe in place with a handle. The pipe lifter operates on the same principle except in an 'internal way'. Swung from the boom, the lifter inserts into a length of pipe and locks with a thumb catch. From the rack of casings, the boom operator can swing a length over the one held by the holder, enabling the two sections to be welded together. The Eastwoods' devices are able to handle all sizes of pipe from six to twelve inch diameters. (Heiss-NWWA)

SUBMERSIBLE PUMP DESIGN: DEPENDENT ON WELL DIAMETER AND DEPTH.
Water Well Journal, Vol 31, No 3, p 51-54, March, 1977. 1 tab.

Descriptors: *Pumps, *Deep wells, Water levels, Impellers, Water wells.
Identifiers: *Submersible pumps, *Well design, Well diameter, Vertical turbine pumps, Net required inlet head, Total available inlet head.

Recent improvements in submersible electric motors, watertight seals, and power cables have resulted in the submersible pump, which eliminates the long drive shafts and bearing assemblies necessary for the surface-driven vertical turbine pumps originally developed for deep wells. Proper well design, however, is essential for obtaining good performances and long life of the submersible pump. Well diameter is directly related to the size of the pump; a good rule is to select a well casing two sizes larger than the nominal pump diameter. Submersible pumps lift water by developing a negative pressure head, allowing atmospheric pressure to raise water to the surface. A certain amount of hydraulic head at the pump inlet is necessary to prevent pump damage to cavitation (net required inlet head' or NRIH). For proper pump operation, the 'total available inlet head' must exceed the sum of the NRIH plus water vapor pressure plus entrance and friction losses. Total available inlet head can be increased by placing the pump inlet at a lower level of the well or by lowering pumping rate to decrease drawdown. (Eberle-NWWA)

USE OF REMOTE SENSING TO QUANTIFY CONSTRUCTION MATERIAL AND TO DEFINE GEOLOGIC LINEATIONS; DICKEY-LINCOLN SCHOOL LAKES PROJECT, MAINE,
Cold Regions Research and Engineering Lab. Hanover, N.H. Research Div.
H. L. McKim, and C. J. Merry.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-023 276, Price Codes: A03 in paper copy, A01 in microfiche. Special Report 242, Part I, December 1975. 26 p, 19 fig, 5 tab, 11 ref.

Descriptors: *Remote sensing, *Construction materials, *Dam construction, *Maine, Damsites, Earth dams, Dikes, Aerial photography, Satellites(Artificial), Aircraft, Geology, Earthquakes, Geological surveys, Geologic units, Geologic mapping, Geologic formations, Fractures(Geologic), Faults(Geologic), Projects, Reservoirs.
Identifiers: *Geologic lineations, *Dickey-Lincoln School Lake Project(ME).

A potential site for construction of a series of earth dams and dikes with a maximum height of 335 ft, the Dickey-Lincoln School Lakes Project, is being evaluated. The site is located on the St. John River in Aroostook County, Maine, approximately 30 mi west of the town of Ft. Kent. The project is primarily designed to generate hydroelectric power, but it is also intended to provide flood control. During November 1974, a study was initiated to apply state-of-the-art remote sensing techniques to the delineation and quantification of surficial geology units to locate construction material within the headwaters of the St. John River Basin. A photomosaic was prepared from 1966 black and white photography (scale 1:33,600). Fourteen surficial geology units were delineated in an 1100-sq mi area. The areal extent of each surficial geology unit within a 4-mi radius of the 3 dike sites and within a 6-mi radius of the main dam site was quantified using a planimetric color densitometer. The volume of construction material was computed based upon these areal determinations and estimated depths. Considerable time was saved using remote sensing techniques compared with conventional ground surveys. The volume estimates obtained from this investigation were compared with the estimates of required construction material computed during the 1967 initial design phase. The comparison showed that the required construction material could be found within the prescribed area around the dam and dike sites. Because transportation of materials is a major cost in dam construction, the reduction in transportation distances determined from this study could result in considerable savings. (Sims-ISWS)

8E. Rock Mechanics and Geology

CONFERENCE ON RESEARCH IN TUNNELING AND EXCAVATION TECHNOLOGY,
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 680, Price codes: A05 in paper copy, A01 in microfiche. Report NSF-RA-T-73-097, Proceedings of a Conference held September 14-15, 1973, Spring Hill Conference Center, Wayzata, Minnesota, September 1973. 87 p. S.L. Crouch, Conference Chairman. NSF GI-40254.

Descriptors: *Rock mechanics, *Tunneling, *Conferences, *Excavation, Tunnel construction, Rock properties, Earth handling equipment, Tunneling machines, Drilling, Rock excavation, Rocks, Underground structures, Civil engineering.
Identifiers: *Tunnel boring.

The purposes of the conference were (1) to discuss the aims and progress of the NSF/RANN Excavation Technology Program, and (2) to give researchers an opportunity to present their recent findings and discuss them with others working in the field. Twenty different NSF/RANN-supported research projects were described during 7 conference sessions. Slightly more than half of the projects involved new or improved methods of excavating rock, while the rest were concerned with such aspects of excavation as: rock properties and their effects on tunnel boring, machine feasibility and advance rates, and structural and systems analysis of the excavations and the excavation process. (Sims-ISWS).

CHICAGO DRIVES LARGE BORES TO CONTROL COMBINED SEWAGE FLOW.
Engineering News-Record, Vol. 198, No. 5, p 20, February, 1977. 1 fig.

Descriptors: *Combined sewers, *Runoff, *Overflow, *Water pollution sources, *Pollution abatement, Construction, Reservoirs, Waste treatment, Waste water treatment, Engineering structures, Underground storage, Rock excavation, Tunnel excavation, Costs, Illinois, New York.
Identifiers: *Chicago(Ill), Rochester(NY).

Chicago has begun work on a program to control storm and sanitary sewage runoff by utilizing underground storage caverns. With pilot bores for testing tunneling and sealing completed, work on the remaining hardrock tunnels has proceeded. The two systems will contain 125 miles when completed in 10 years. Combined sewer overflow has been an irritant, creating problems of waterway pollution and disease. Sewer overflow has accounted for nearly 45% of the metropolitan area water pollution. The tunnel and reservoir plan provides for three reservoirs (118,000 acre/foot of combined sewage) which will pump stored water to surface plants for off-peak treatment. Rochester, New York, and other cities are considering similar plans. Also included in the system are a $365 million mainstream system under downtown Chicago, $114 million pumping station and associated structures, and tunnels, shafts, and pumping works estimated at $183 million. Machine mining without blasting is to be used for hardrock

LIBRARY U. OF I. URBANA-CHAMPAIGN

tunneling to avoid surface disturbances. Shale portions of rock must be concrete-lined, and more competent rock must be 100% grouted to prevent infiltration. Surface disturbance must be minimized when drop shafts are excavated. (Collins-FIRL)

SLIPFORM PAVER, STEEL FORMS SPEED LINING OF 25,000-FOOT SEWER TUNNEL,
N. Hancock.
Engineering and Contract Record, Vol. 90, No. 1, p 64-65, January, 1977. 1 fig.

Descriptors: *Tunnel linings, *Tunnel construction, Sewers, Engineering structures, Construction, Concrete construction, Concrete placing, Equipment, Underground structures, Construction equipment, Canada.
Identifiers: Montreal(Canada).

A slipform paver was used to pour a 12-inch concrete lining for a 25,000-foot sewer tunnel in Montreal, Canada. Special steel forms were used for the 16-foot horseshoe-shaped arch and wall. The Miller M9000 paver can slipform up to 16 feet wide and 2 feet deep and was used to form curbs and an invert. After a very successful experience with tunnels for the Montreal subway system, modifications were instituted to make the apparatus applicable to sewer tunnel construction. Telescoping steel forms with hinged upper quarters were used on the horseshoe portion of the tunnel. When the first form is anchored and the concrete is poured, the second 40-foot form is moved ahead, anchored, and more concrete is poured. This operation is repeated until the first form is ready to be moved on the 20-foot traveler to a new position. This process completes about 1,000 feet of wall and arch per week. (Collins-FIRL)

MAKE WIRE ROPE LAST-TREAT IT LIKE A MACHINE,
The Drilling Contractor, Vol. 33, No. 1, p 55, January-February, 1977. 2 fig.

Descriptors: *Drilling equipment, Mechanical properties, Flexibility, Stress analysis, Strain measurement.
Identifiers: *Wire rope, Rope cores, Strand construction.

Wire rope is a piece of flexible, multi-wired stranded machinery made up of many precision parts. The usual type of wire rope consists of a core member around which any number of multi-wired strands are 'laid' or helically wrapped. Wire ropes are specifically tailored for special uses. These specific designs are accomplished by combinations of wire size, number and arrangements, and by length and direction of lay. Wire rope should be selected with the specific use in mind. Proper selection includes such factors as: the lay of the rope (right, left, regular or lang), type of strand construction, the proper combination of wire diameters, the proper combination of physical properties of the wires, i.e., tensile strength, elongation, resistance to torsion, hardness and fatigue resistance, the relative length of rope lay and of strand lay, and the specific size, type, grade and construction of the core. A great number of combinations are available in the fabrication of a wire rope. For best service from a wire rope it should be designed to meet the specific applications it will be used in. ELECTRIC LOGGING,
National Water Well Association, Worthington, Ohio.
T. E. Gass.
Water Well Journal, Vol 31, No 3, p 34-35, March, 1977. 2 fig.

Descriptors: *Electrical well logging, Resistivity, Logging(Recording), Boreholes, Water wells.

Electric log interpretation is best left to experienced trained hydrologists, however, well drillers can make some basic readings if they know what to look for. E-log interpretation involves simultaneous reading of the spontaneous potential (SP) and resistivity curves, which relate to the fluids in the formation, and comparison with the drillers log, which indicates lithologic change. SP variations in unconsolidated material are read relative to a fairly uniform baseline obtained in clays. Shifts to the right generally indicate fresh water in permeable material. Shifts to the left show a higher concentration of dissolved solids, large shifts indicating saline water. For the resistivity curve, shifts to the right indicate fresh water or dense rock, movement to the left indicates clay or saline water. (Eberle-NWWA)

BITS AND PIECES,
Plummer and McDannald Co., Galena, Ohio.
R. B. McDannald.
Water Well Journal, Vol 31, No 2, p 21, February, 1977.

Descriptors: *Well casings, *Electronic equipment, Water wells.
Identifiers: *Pitless adapters, *Capped wells, Magnetic locators, Well depth measurement.

The problem of locating wells that have been cut off and capped below ground may diminish as legislation and modern well drilling and compltion methods promote increased use of pitless adapters. For those cases in which a driller must locate a lost well, the Schonstedt Model GA-32 Magnetic Locator is recommended. This portable and easy-to-use tool enables one to detect cut-off casing at depths up to 5 1/2 feet, and is useful for finding curb boxes, valves, and septic tank lids. Also recommended is a measuring tool available from Velsen Pump and Supply (Norton, Ohio) used for measuring deep holes being drilled by cable-tool methods. (Eberle-NWWA)

HOW TO DEAL WITH PITTING AND CORROSION.
Water Well Journal, Vol 31, No 3, p 48, March, 1977.

Descriptors: *Corrosion control, *Pitting(Corrosion), *Pumps, Jets, Bacteria algae, *Chlorination, Acidity, Neutralization, Water wells, Water quality control.
Identifiers: Soda ash solution.

Pitting due to organic growth and corrosion due to acid well water frequently shorten the life of pumps, drop pipes, jets, bowl assemblies, and cylinders. Pitting results when bacteria and algae attach themselves to metal surfaces, forming minute electrolytic cells and drawing metallic ions from the equipment surfaces into surrounding water. Inexpensive automatic chlorinators help control these organisms and thus prolong pump life. Acid ground waters which can cause rapid corrosion and deterioration of entire water systems can easily be detected with a simple pH tester. These acid waters may be neutralized by combining soda ash solution with chlorine solution and feeding the mixture into the well via automatic chlorination equipment. (Eberle-NWWA)

SAND STABILIZATION ON THE DUNES BEACH AND SHOREFACE OF A HISTORICALLY ERODING BARRIER ISLAND. WASSAW ISLAND EROSION STUDY, PART III,
Georgia Marine Science Center, Savannah.
George F. Oertel, and James L. Harding.
Georgia Marine Science Center Sea Grant Technical Report Series No 77-3, (1977). 47 p, 4 fig, 7 ref, 3 append. TRS-77-3. SG-04-5-158-4.

Descriptors: *Georgia, *Barrier islands, *Erosion control, *Sedimentation, *Stabilization, *Shore protection, Dunes, Beaches, Shores.
Identifiers: Snow fences, Artificial seaweed, Durabags, Sea Grant Program.

Two earlier reports on the sedimentary framework and water-flow characteristics adjacent to the north end of Wassaw Island, Georgia supplement this report. The effects of synthetic devices on the sediment budget of a historically eroding area of shore is described. Three devices were used to modify the sediment transport patterns in order to control erosion. The marginal tidal channel at the north end of Wassaw Island appears to be a critical feature controlling the development of the shore. Submarine pervious dikes such as those constructed with Durabags are useful structures for keeping the marginal channels open. When these channels are open, sediment is transported to and deposited at the north end of Wassaw Island. Snow fences appeared to be an effective means of trapping and storing large quantities of sand on the upper beach. However, fences were only effective where rapid beach growth produced broad areas of loose sand available for eolian transport. Snow fences were not an effective means of building the beach in areas where the beach is eroding and the shoreline is retreating. Small plots of artificial seagrass had no obvious contributing effect for producing a source of sediment for the beach. (Sinha-OEIS)

TESTING AND GROUTING LEAKING JOINTS,
Halliburton Services, Duncan, Okla. Environmental Control Dept.
J. Herndon.
Water and Sewage Works, Vol. 124, No. 1, p 76, January, 1977. 1 fig.

Descriptors: *Grouting, *Chemical grouting, *Leakage, *Equipment, Sealants, Seepage, Sewerage, Infiltration, Testing, Repairing.

A three-element packer was designed to alleviate the problem of sewer infiltration through faulty joints. This instrument tests, grouts and retests joints. The packer contains a liquid-filled center portion connected to a direct reading, Bourbon tube pressure gauge which is viewed by television during air testing or grouting. The packer is usually pulled through the sewer line from the downstream manhole. The air test is performed by applying air to the center void until test pressure is attained; the pressure is released from the line and stays trapped in the void around the joint. Void pressure decrease indicates a leak. PWG chemical grout is mixed and pumped in two streams to the packer and, as the grout is injected, the two streams mix to begin a reaction which forms a high-strength gelled material that squeezes around the center element and fills the void between the flows into the leaking joint. This prevents further leakage. If necessary, retesting of the joint can be performed by deinflating and reinflating the end elements of the packer. The system is efficient and can be controlled by one operator. It is also economical since a minimum amount of grout is wasted and no excess is used. (Collins-FIRL)

PREVENTIVE SEWER MAINTENANCE HELPS PRESERVE HISTORIC ANNAPOLIS.
Public Works, Vol. 108, No. 2, p 58-59, February, 1977.

Descriptors: *Sewerage, *Inspection, *Cleaning, *Equipment, *Maintenance, Water districts, Machinery, Repairing, Sanitary engineering, Water quality control, *Maryland.
Identifiers: *Annapolis(Md).

The role of sewer maintenance in preserving Annapolis, Maryland, as a clean city and tourist attraction was reviewed. The program was designed to prevent blockages which could cause backups and flooding. An evaluation of equipment was conducted in 1972 and a Myers-Sherman Vactor 'Jet-Rodder' was selected to bring the city's equipment level to a state of adequacy. First used full time on emergency work, the apparatus now cleans the entire system on a regular basis. Trouble spots are serviced every six months and the rest of the system is inspected annually and cleaned every two years. The former average of 370 emergency calls per year has been cut by more than 60%. Since the new machinery has been in use, there has been no severe basement flooding problem or back-up problem. Claims for blocked line damage were reduced by 50%. Economic savings have been made in maintenance and labor costs, as well as costs associated with treatment and removal of the sludge previously accumulated in the system. Lift station wet wells are now cleaned every four months and the machinery has been used to remove sand and gravel from filters. Valve boxes can now be cleared of clogging debris and other adapted uses include the removal of dead fish accumulations from the harbor. (Collins-FIRL)
W77-06990

COPPER SULFATE FIGHTS ROOT GROWTH IN SEWER SYSTEMS,
S. B. Tuwiner.
Water and Sewage Works, Vol. 124, No. 1, p 40-41, January, 1977. 1 fig.

Descriptors: *Root distribution, *Root systems, *Copper sulfate, *Sewerage, *Cleaning, Drainage, Storm drains, Combined sewers, Municipal wastes, Domestic wastes, Hydrogen ion concentration, Flow.

Copper sulfate has become an effective cure for the problem of sewer and storm drain blockage by root and fungus growth. Root growth in pipes produces a mechanical obstruction causing unsanitary conditions, and an odor problem from the decomposition of detained organic matter. This obstruction deteriorates mortar pipe, joints, manholes, pipes and substructures, treatment plant units and mechanisms; it reduces the capacity of pumps, force mains and gravity lines, and it can lead to stream pollution. Copper sulfate treatment produces an immediate abatement of these conditions, but an exact usage formula has not been deduced. The only guideline is that the amount of needed copper sulfate is in ration to the total mass of roots present. The pH-alkalinity test can be used to determine the existence of a problem as well as the results of treatment. Sewer and lateral application is by sprinkling copper sulfate along the invert of the pipe. In homes and buildings, flushing the chemical through the toilet is the prescribed procedure. About two pounds is used for home treatment. It is safe to use around trees because it results in only local killing action on the root system. It is a stable, crystalline, easily handled, mildly acidic material. Use should be planned only at low flow periods to avoid excess dilution. (Collins-FIRL)

CONTROL SEWER CORROSION WITH H2O2,
Corpus Christi Public Utilities, Tex.
D. G. Matthews.
The American City and County, Vol. 92, No. 2, p 65, February, 1977.

Descriptors: *Sewers, *Corrosion, *Corrosion control, *Odor, *Hydrogen sulfide, Waste treatment, Waste water treatment, Liners, Chemical reactions, Economics, *Texas.
Identifiers: *Hydrogen peroxide, *Corpus Christi(TX).

In Corpus Christi, Texas, hydrogen peroxide was used to control odor and hydrogen sulfide-induced corrosion. The city tried, unsuccessfully, to eliminate the problem with the use of liners for its concrete sewers. No liner material proved satisfactory. Peroxide completely oxidizes hydrogen sulfide. Water and sulfur are formed in acid or neutral sewage; water and sulfates are formed in alkaline sewage. Although available in various concentrations, a 50% solution of hydrogen peroxide is the maximum concentration that can be used safely and housed easily in residential areas, although the 70% solution is the more economical. Other alternatives were suggested, but the peroxide proved efficient and more effective. (Collins-FIRL)

NEW PROGRAMS IMPROVE SENSITIVE AREAS OF WATER AND SEWER SYSTEMS,
Waltham Public Works, Mass.
E. F. Delaney.

Descriptors: *Sewage, *Instrumentation, Measurement, Equipment, Cities, Water use, Storage, Pumping plants, Design criteria, Interceptor sewers, *Massachusetts.
Identifiers: *Waltham(MA).

Waltham, Massachusetts, has embarked on a program of water and sewer improvements. The oil and inaccurate metering system was first to be renovated to improve efficiency in accounting for water use. Nine thousand self-generating remote readout meters have already been installed, producing a $33,000 savings in one year, and accounting for 138 million 'lost' gallons of water. These meters, which will eventually total 12,000, eliminate the need for access to homes. The specifications required a self-generating remote meter with a simplified two-wire system; a bronze maincase; noncorrosive gears and measuring chamber; a rost bottom plate for severe winters; and a hermetically sealed, easily removable register. The water program also included new municipal storage and pumping facilities, new pumping station and interceptors, and a preventive maintenance program. (Collins-FIRL)

EGG INCUBATION AND LARVAL REARING OF NAVAGA (ELEGINUS NAVAGA PALL.), POLAR COD (BOREOGADUS SAIDA LEPECHIN) AND ARCTIC FLOUNDER (LIOPSETTA GLACIALIS PALL.) IN THE LABORATORY,
All Union Research Inst. of Marine Fisheries and Oceanography, Moscow (USSR).
T. M. Aronovich, S. I. Doroshev, L. V. Spectorova, and V. M. Makhotin.
Aquaculture, Vol 6, 1975, p 233-242, 3 tab, 7 fig, 8 ref.

Descriptors: *Laboratory tests, *Incubation, *Larval growth stage, Eggs, Hatching, Larvae, Feeding rates, Fish.
Identifiers: Navaga, Arctic flounder, Polar cod, First feeding.

The incubation period for polar cod eggs was 35 days, for arctic flounder 41-42 days, and for navaga 48 days. Emergent larvae averaged 5.54 mm (polar cod), 6.0 mm (Navaga and 5.56 mm (arctic flounder). The rate of yolk sac absorption was higher in starving larvae than in feeding ones. In polar cod and arctic flounder the yolk sac was fully utilized by 18-20 days after hatching and 22-24 days after hatching for navaga. Starvation beyond 8-10 days after hatching was critical for navaga, and 20 days for polar cod. Artemia nauplii of about 600 microm in length and natural plankton consisting of Paracalanus and Pseudocalanus nauplii are suggested as an initial food for navaga and polar cod at a density of one organism/ml. Feeding efficiency of larvae at the time when they first established feeding was low. Food digestion in older larvae proceeded faster than in the early stages of development. Chilton-ORNL)

ANNOTATED BIBLIOGRAPHY ON NORTHERN ENVIRONMENTAL ENGINEERING 1974-75,
Environmental Protection Service, Ottawa (Ontario).
For primary bibliographic entry see Field 05D.
W77-06948

SUBJECT INDEX

Loss of 2,4-D in Runoff from Plots Receiving Simulated Rainfall and from a Small Agricultural Watershed,
W77-06908 5B

ABALONE
Long-Term Lead Accumulation in Abalone (Haliotis Spp.) Fed on Lead-Treated Brown Algae (Egregia Laevigata),
W77-06776 5C

ABSORPTION
The Accumulation of Organic Mercury from Sea Water by the Plaice, Pleuronectes platessa L.,
W77-06607 5C

LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

Toxicity of Fluoride to Brown Trout Fry (Salmo trutta),
W77-06628 5C

The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

Effects of Various Ecological Factors on Radiostrontium Uptake in Two Euryhaline Teleosts: Mugil Auratus Risso and Pleuronectes Platessal, (Influence de Divers Facteurs Ecologiques Sur L'Accumulation du Radiostrontium Chez Deux Teleosteens Euryhalins: Mugil Auratus Risso et Pleuronectes Platessa L.),
W77-06777 5C

Dependence of Water Absorption by the Cell Walls of Plant Leaves on the Volume of the Free Space, (In Russian),
W77-06827 2I

CETIC ACID
Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

CID SOLUBILIZATION
Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

CIDS
Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

CROLEIN
The Influence of Acrolein and Hydrocryle on the Development Dynamics of Aquatic Bacteria,
W77-06690 5C

ACTIVATED CARBON
Process for the Purification of Waste Waters with Activated Carbon,
W77-07093 5D

ACTIVATED SLUDGE
Activated Sludge Treatment of High Strength NSSC Mill Effluent,
W77-06945 5D

Expansion Comes Quickly to AWT Plant,
W77-07009 5D

Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

Influence of Phosphorus Removal on Solids Budget,
W77-07032 5D

Some Factors Affecting Floc Formation by Zoogloea Ramigera, Strain I-16-M,
W77-07042 5D

The Effect of High Purity Oxygen on the Activated Sludge Process,
W77-07043 5D

Plant Data Analysis of Temperature Significance in the Activated Sludge Process,
W77-07046 5D

Fuel Gas and Electricity from Municipal Sewage,
W77-07065 5D

Renovated Water from Municipal Sewage Treatment Plants,
W77-07086 5D

Method of Treating Waste Water with Jet Nozzles,
W77-07090 5D

ADAPTATION
Some Significant Regularities in Plant Hydroadaptation, (In Russian),
W77-06774 3B

ADENOSINE TRIPHOSPHATE
Adenosine Triphosphate (ATP) Levels in Microbial Cultures and a Review of the ATP Biomass Estimation Technique,
W77-06942 5A

ADJUSTED COSTS
Adjustment Costs and Optimal Waste Treatment,
W77-06699 5D

ADJUSTMENT COSTS
Adjustment Costs and Optimal Waste Treatment,
W77-06699 5D

ADSORPTION
Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

Phosphates in Soils Treated with Sewage Water: III. Kinetic Studies on the Reaction of Phosphates with Aluminum Compounds,
W77-07054 5B

Solubility and Plant Uptake of Cadmium in Soils Amended with Cadmium and Sewage Sludge,
W77-07055 5B

Quantitative Analysis of Enteroviruses in Water with Various Degrees of Pollution, (In Russian),
W77-07070 5A

Adsorption, Coagulation and Filtration Make a Useful Treatment Combination-Part 2,
W77-07077 5D

ADVECTION
Evaporation and Advection II: Evaporation Downwind of a Boundary Separating Regions Having Different Surface Resistances and Available Energies,
W77-06897 2D

AEOLIAN SOILS
Computing Eolian Sand Transport from Routine Weather Data,
W77-06669 2L

AERATED LAGOONS
Stabilisation Lagoons Including Experience in Brazil. Part 1,
W77-07063 5D

AERATION
Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

Sewage Aeration Impeller-With Automatic De-Icing and Anti-Clogging System,
W77-07001 5D

Design Criteria for Waste Water Aerator Drives,
W77-07060 5D

Method of Treating Waste Water with Jet Nozzles,
W77-07090 5D

AERATOR DRIVES
Design Criteria for Waste Water Aerator Drives,
W77-07060 5D

AERIAL PHOTOGRAPHY
Improving Estimates of Streamflow Characteristics Using LANDSAT-1 (ERTS-1) Imagery,
W77-06972 4A

AEROBIC BACTERIA
Stabilisation Lagoons Including Experience in Brazil. Part 1,
W77-07063 5D

AEROBIC DIGESTION
Influence of Phosphorus Removal on Solids Budget,
W77-07032 5D

AEROBIC TREATMENT
Method of Waste Treatment and Algae Recovery,
W77-07003 5D

Conditioning and Land Application of Aerobically Digested Sludge,
W77-07058 5D

Design Criteria for Waste Water Aerator Drives,
W77-07060 5D

AFRICA
Circulation and Hydrographic Structure Over the Ghana Continental Shelf During the 1974 Upwelling,
W77-06893 2L

LIBRARY U. OF I. URBANA-CHAMPAIGN

AFRICA

Hydrochemistry of the Lake Magadi Basin, Kenya,
W77-06967 2K

AGE

Effects of Various Ecological Factors on Radiostrontium Uptake in Two Euryhaline Teleosts: Mugil Auratus Risso and Pleuronectes Platessal, (Influence de Divers Facteurs Ecologiques Sur L'Accumulation du Radiostrontium Chez Deux Teleosteens Euryhalins: Mugil Auratus Risso et Pleuronectes Platessa L.),
W77-06777 5C

AGE CLASSES

Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

AGRICULTURAL CHEMICALS

Loss of 2,4-D in Runoff from Plots Receiving Simulated Rainfall and from a Small Agricultural Watershed,
W77-06908 5B

The Impact of Fertilizer Use and Crop Management on Nitrogen Content of Subsurface Water Draining from Upland Agricultural Watersheds,
W77-06909 5B

AGRICULTURAL WATERSHEDS

The Impact of Fertilizer Use and Crop Management on Nitrogen Content of Subsurface Water Draining from Upland Agricultural Watersheds,
W77-06909 5B

AIR PLUMES

Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

AIR POLLUTION

Pollution Prevention, Not Control Called Key to a Clean Environment.
W77-06861 5G

Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

AIR POLLUTION EFFECTS

Coastal Meteorological Networks to Determine Effects of Nuclear Plant Cooling Systems,
W77-06643 2B

AIR TEMPERATURE

A Single Field of View Method for Retrieving Tropospheric Temperature Profiles from Cloud-Contaminated Radiance Data,
W77-06887 2B

AIRPORTS

Compressed Air for Supercooled Fog Dispersal,
W77-06674 3B

ALABAMA

Urbanization and Flooding in Shades Creek Basin, Jefferson County, Alabama,
W77-06977 4C

ALASKA

Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 1: Marine Mammals, Marine Birds.
W77-06793 6G

Baseline Characterization of Marine Mammals in the Bering Sea,
W77-06794 6G

Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

Distribution and Abundance of Bowhead and Belukha Whales in the Bering and Chukchi Seas,
W77-06796 6G

The Natural History and Ecology of the Bearded Seal (Erignathus Barbatus) and the Ringed Seal (Phoca (Pusa) Hispida),
W77-06799 6G

An Aerial Census of Spotted Seals, Phoca Vitulina Largha,
W77-06800 6G

Identification, Documentation and Delineation of Coastal Migratory Bird Habitat in Alaska,
W77-06804 6G

Identification, Documentation, and Delineation of Coastal Migratory Bird Habitat in Alaska, and the Distribution, Abundance and Feeding Ecology of Birds Associated with Pack Ice,
W77-06805 6G

Ecosystem Dynamics Birds and Marine Mammals. Part I: Preliminary Estimates of Pinniped - Finfish Relationships in the Bering Sea,
W77-06806 6G

Ecosystem Dynamics Birds and Marine Mammals. Part II: Food Web Structure and Trophic Relations of Bering Sea Avifauna (Preliminary Report),
W77-06807 6G

Ecosystem Dynamics Birds and Marine Mammals. Part III: A Dynamic Numerical Marine Ecosystem Model for Evaluation of Marine Resources in Eastern Bering Sea,
W77-06808 6G

Reproductive Ecology of Pribilof Island Seabirds,
W77-06809 6G

Community Structure, Distribution, and Interrelationships of Marine Birds in the Gulf of Alaska,
W77-06810 6G

Shorebird Dependence on Arctic Littoral Habitats,
W77-06811 6G

Avifaunal Utilization of the Offshore Island Area Near Prudhoe Bay, Alaska,
W77-06812 6G

Birds of Coastal Habitat on the South Shore of Seward Peninsula, Alaska,
W77-06813 6G

Ecology and Behavior of Southern Hemisphere Shearwaters (Genus Puffinus) and Other Seabirds, When Over the Outer Continental Shelf of the Bering Sea and Gulf of Alaska During the Northern Summer,
W77-06814 6G

Seasonal Distribution and Abundance of Marine Birds,
W77-06815 6G

Preliminary Catalog of Seabird Colonies and Photographic Mapping of Seabird Colonies,
W77-06816 6G

Review and Analysis of Literature and Unpublished Data on Marine Birds,
W77-06817 6G

Migration of Birds in Alaska Coastal and Marine Habitats Subject to Influence by OCS Development,
W77-06818 6G

Feeding Ecology and Trophic Relationships of Alaskan Marine Bird, and Population Dynamics of Marine Birds,
W77-06819 6G

Avian Community Ecology at Two Sites on Espenberg Peninsula in Kotzebue Sound, Alaska. A Composite Study of: (1) Habitat Utilization and Breeding Ecology of Waterbirds, (2) Habitat Utilization and Breeding Ecology of Shorebirds and Nonwaterbird Species, and (3) Habitat Utilization, Breeding Ecology, and Feeding Ecology of Predators of Birds,
W77-06820 6G

Studies of Populations, Community Structure and Colony of Marine Birds at King Island, Bering Strait Region, Alaska,
W77-06821 6G

Avian Community Ecology of the Akulik - Inglutalik River Delta, Norton Bay, Alaska,
W77-06822 6G

A Comparative Sea-Cliff Bird Inventory of the Cape Thompson Vicinity, Alaska,
W77-06823 6G

Characterization of Coastal Habitat for Migratory Birds: Northern Bering Sea,
W77-06824 6G

Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 2: Fish, Plankton, Benthos, Littoral.
W77-06825 6G

The Distribution, Abundance, Diversity and Productivity of Benthic Organisms in the Bering Sea,
W77-06826 6G

Spawning Herring Surveys in the Bering Sea and Finfish Resource Surveys in Norton Sound and Kotzebue Sound,
W77-06828 6G

Pelagic and Demersal Fish Assessment in the Lower Cook Inlet Estuary System,
W77-06829 6G

Razor Clam (Siliqua Patula, Dixon) Distribution and Population Assessment Study,
W77-06830 6G

Resources of Non-Salmonid Pelagic Fish of the Eastern Bering Sea and the Gulf of Alaska,
W77-06832 6G

Baseline/Reconnaissance Characterization, Littoral Biota, Gulf of Alaska and Bering Sea,
W77-06833 6G

Plankton of the Gulf of Alaska - Ichthyoplankton,
W77-06834 6G

Initial Zooplankton Investigations in Lower Cook Inlet,
W77-06835 6G

Phytoplankton and Primary Productivity in the Northeast Gulf of Alaska,
W77-06836 6G

Baseline Studies of Fish and Shellfish Resources of Norton Sound and the Southeastern Chukchi Sea,
W77-06839 6G

Beaufort Sea Estuarine Fishery Study,
W77-06840 6G

The Distribution, Abundance, Diversity, and Productivity of Benthic Organisms in the Gulf of Alaska,
W77-06841 6G

Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea,
W77-06842 6G

Reconnaissance Characterization of Littoral Biota, Beaufort and Chukchi Seas,
W77-06843 6G

Ichthyoplankton of the Eastern Bering Sea,
W77-06845 6G

Assessment of Pelagic and Nearshore Fish in Three Bays on Southeast Kodiak Island,
W77-06846 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

Technical Trawl Survey of the Benthic Epifauna of the Chukchi Sea and Norton Sound.
W77-06848 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

Program Development Plan. Environmental Assessment of the Alaskan Continental Shelf,
W77-06878 6G

Sludge Dewatering on Alaska's North Slope,
W77-07030 5D

LBERNI INLET (BRITISH COLUMBIA)

The Influence of Wind on the Surface Layer of a Stratified Inlet: Part I. Observations,
W77-06894 2L

The Influence of Wind on the Surface Layer of a Stratified Inlet: Part II. Analysis,
W77-06895 2L

LGAE

The Algal Flora in the Thermal Baths of Montegrotto Terme (Padua). Its Distribution Over One-Year Period,
W77-06770 5C

Correlation Coefficients and Concentration Factors of Copper and Lead in Seawater and Benthic Algae,
W77-06783 5C

Algal Supplement Enhancement of Static and Recirculating System,
W77-06933 5C

Method of Waste Treatment and Algae Recovery,
W77-07003 5D

LGAE RECOVERY

Method of Waste Treatment and Algae Recovery,
W77-07003 5D

ALGORITHMS

Mathematical Model of Water Resources Utilization in a River Basin,
W77-06719 4A

ALLUVIAL AQUIFERS

Chemical Quality of Effluents and Their Influence on Water Quality in a Shallow Aquifer,
W77-06658 5B

Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

ALTERNATIVE PLANNING

Design Study of Environmental and Human Cultural Information System Needs in Urban Water Resource Development,
W77-06634 6B

The Multi-Step Method for Simulation and Optimization of Vistula River Planning Alternatives,
W77-06734 4A

The Out-of-Kilter Algorithm as a Single-Step Method for Simulation and Optimization of Vistula River Planning Alternatives,
W77-06735 4A

ALUMINUM RECYCLING

Recycling of Aluminum Used for Phosphate Removal in Domestic Waste Water Treatment,
W77-07099 5D

AMMONIA

Ammonia Concentration in Relation to Ammonia Toxicity During a Rainbow Trout Rearing Experiment in a Closed Freshwater-Seawater System,
W77-06743 5C

UNOX System for Waste Water Treatment,
W77-07014 5D

AMMONIA COMPOUNDS

Apparatus and Process for Removing Ammonia Nitrogen from Waste Water,
W77-07008 5D

AMMONIA TOXICITY

Ammonia Concentration in Relation to Ammonia Toxicity During a Rainbow Trout Rearing Experiment in a Closed Freshwater-Seawater System,
W77-06743 5C

ANADROMOUS FISH

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

Identity, Origin and Development of Off-Flavors in Great Lakes Anadromous Fish,
W77-06931 5A

ANAEROBIC BACTERIA

The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

ANAEROBIC CONDITIONS

The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

Anaerobic Filter Treats Waste Activated Sludge,
W77-07078 5D

ANAEROBIC DIGESTERS

Anaerobic Digestion and Membrane Separation for the Treatment of Domestic Sewage,
W77-06631 5D

ANAEROBIC DIGESTION

Anaerobic Digestion and Membrane Separation for the Treatment of Domestic Sewage,
W77-06631 5D

Elimination of Anaerobic Digester Supernatant,
W77-07059 5D

ANAEROBIC TREATMENT

Stabilisation Lagoons Including Experience in Brazil. Part 1,
W77-07063 5D

ANALOG MODELS

Analog-Model Simulations for Secondary Canal Controls and Forward Pumping Water-Management Schemes in Southeast Florida,
W77-06968 4B

ANALYTICAL TECHNIQUES

LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

Computing Eolian Sand Transport from Routine Weather Data,
W77-06669 2L

Measurement in a Marine Environment Using Low Cost Sensors of Temperature and Dissolved Oxygen,
W77-06960 7B

Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

Drugs and Drug Metabolites as Environmental Contaminants: Chlorophenoxyisobutyrate and Salicylic Acid in Sewage Water Effluent,
W77-07045 5A

Simplified Methods of Computing the Quantity of Urban Runoff,
W77-07072 5B

Concentration and Determination of Trace Organic Pollutants in Water,
W77-07098 5A

ANCESTRAL CHANNELS

Delaware River: Evidence for Its Former Extension to Wilmington Submarine Canyon,
W77-06966 2E

ANEMONEFISH

Notes on the Nesting Success and Fecundity of the Anemonefish Amphiprion Clarkii at Miyake-Jima, Japan,
W77-06763 5C

ANGLIAN WATER AUTHORITY (ENGLAND)

The Operations Section of Lincoln Sewage Division,
W77-07023 5D

ANIMAL GROWTH

Environmental Factors Affecting Survival and Growth of Vibrio Parahaemolyticus. A Review,
W77-06765 5C

ANIMAL PATHOLOGY

Gas Bubble Disease of Salmonids: A Critical Review,
W77-06920 5

LIBRARY U. OF I. URBANA-CHAMPAIGN

ANIMAL PATHOLOGY

Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

ANIMAL PHYSIOLOGY

The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

ANION EXCHANGE

The Removal of Organic Matter from Water Supplies by Ion Exchange,
W77-06760 5F

ANNAPOLIS (MD)

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

AQUACULTURE

Algal Supplement Enhancement of Static and Recirculating System,
W77-06933 5C

AQUATIC ALGAE

Nutrient Removal by Water Hyacinths,
W77-07036 5G

AQUATIC ANIMALS

Optic Device for Observations of Small Organisms Under Water, (In Russian),
W77-06926 7B

AQUATIC BACTERIA

The Influence of Acrolein and Hydrocryle on the Development Dynamics of Aquatic Bacteria,
W77-06690 5C

AQUATIC ENVIRONMENT

Ecological Data on Continental Aquatic Vegetation, (In Spanish),
W77-06784 2I

AQUATIC FUNGI

Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

AQUATIC HABITATS

Ecological Data on Continental Aquatic Vegetation, (In Spanish),
W77-06784 2I

AQUATIC LIFE

Reconnaissance Characterization of Littoral Biota, Beaufort and Chukchi Seas,
W77-06843 6G

AQUATIC PLANTS

The Mining Fauna in Four Macrophyte Species in Mikolajskie Lake,
W77-06688 5C

Ecological Data on Continental Aquatic Vegetation, (In Spanish),
W77-06784 2I

AQUATIC POPULATIONS

The Distribution, Abundance, Diversity and Productivity of Benthic Organisms in the Bering Sea,
W77-06826 6G

AQUATIC PRODUCTIVITY

Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

AQUEDUCT

Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W77-06973 2D

AQUEDUCTS

Conjunctive Use of the Tajo-Segura Aqueduct Surface System and the Aquifers of the La Mancha Area,
W77-06728 4B

AQUEOUS SOLUTIONS

Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

AQUICULTURE

Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

AQUIFER CHARACTERISTICS

Review and Analysis of Hydrogeologic Conditions Near the Site of a Potential Nuclear-Waste Repository, Eddy and Lea Counties, New Mexico,
W77-06974 5B

AQUIFER TESTING

Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

AQUIFERS

On Large-Scale Simulation of Groundwater Flow Systems,
W77-06713 4B

Construction and Adjustment of a Two-Layer Mathematical Model of the Llobregat Delta,
W77-06722 4A

Integration of Aquifers in Flood Control Projects,
W77-06723 4A

Conjunctive Use of the Tajo-Segura Aqueduct Surface System and the Aquifers of the La Mancha Area,
W77-06728 4B

Tables and Type Curves for Analysis of Pump Tests in Leaky Parallel-Channel Aquifers,
W77-06941 4B

ARCTIC

Shorebird Dependence on Arctic Littoral Habitats,
W77-06811 6G

ARGON

The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

ARGON SOLUBILITIES

The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

ARIZONA

Monitoring Groundwater Quality: Illustrative Examples.
W77-06673 5A

Environmental Impact Statements in Water Resources Planning and Decision Making,
W77-06738 6E

Flood Hazard Information: Cave Creek, Arizona Canal to 19th Avenue, Phoenix, Arizona.
W77-06954 4A

ARKANSAS

Monitoring Groundwater Quality: Illustrative Examples.
W77-06673 5A

AROCLOR

Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

AROMATIC HYDROCARBONS

Identity, Origin and Development of Off-Flavors in Great Lakes Anadromous Fish,
W77-06931 5A

ARTIFICIAL RECHARGE

Streamflow Regulation by Artificial Recharge Fed from Upstream Surface Storage: Derivation of Control Rules,
W77-06725 4A

ASWAN DAM

Nile Cone: Late Quaternary Stratigraphy and Sediment Dispersal,
W77-06650 2L

ASWAN HIGH DAM

Effect of the Nile Flood on the Estuarine and Coastal Circulation Pattern Along the Mediterranean Egyptian Coast,
W77-06907 2L

ATLANTIC OCEAN

Circulation and Hydrographic Structure Over the Ghana Continental Shelf During the 1974 Upwelling,
W77-06893 2L

High Seas Oil Pollution: Particulate Petroleum Residues in the North Atlantic,
W77-06911 5B

ATLANTIC SALMON

Toxicity of Rotenone to Fish in Standardized Laboratory Tests,
W77-06748 5C

ATMOSPHERE

An Estimate of the Input of Atmospheric Trace Elements into the North Sea and the Clyde Sea (1972-3),
W77-06668 5B

Investigation of the Effects of Nonhomogeneous (or Nonstationary) Behavior on the Spectra of Atmospheric Turbulence,
W77-06678 2B

ATMOSPHERIC TURBULENCE

Investigation of the Effects of Nonhomogeneous (or Nonstationary) Behavior on the Spectra of Atmospheric Turbulence,
W77-06678 2B

ATTITUDES

Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

AUSTRALIA
Purifying Water,
W77-07061 5D

AUTOMATION
NASA Develops Water Monitoring System,
W77-06912 5A

Automated Method for the Determination of the Phosphorus Content of Detergents,
W77-06944 5A

AVAILABLE WATER
Preliminary Assessment of the Water Resources of the Tulalip Indian Reservation, Washington,
W77-06971 4A

AVAILABLE WATER-HOLDING CAPACITY (AWHC)
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

BACKWASH TECHNIQUES
Backwashing of Granular Filters,
W77-07037 5D

BACTERIA
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

Adenosine Triphosphate (ATP) Levels in Microbial Cultures and a Review of the ATP Biomass Estimation Technique,
W77-06942 5A

UNOX System for Waste Water Treatment,
W77-07014 5D

On the Self-Purification of Natural Waters, (In German),
W77-07038 5G

Some Factors Affecting Floc Formation by Zoogloea Ramigera, Strain I-16-M,
W77-07042 5D

Ozone Oxidation of Waste Water,
W77-07094 5D

BARCELONA (SPAIN)
Construction and Adjustment of a Two-Layer Mathematical Model of the Llobregat Delta,
W77-06722 4A

BARGES
Dispersion of Liquid Waste from a Moving Barge,
W77-06913 5B

BARRIER ISLANDS
Exchange Through a Barrier Island Inlet: Additional Evidence of Upwelling Off the Northeast Coast of North Carolina,
W77-06654 2L

Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

BASELINE STUDIES
Limnological and Planktonic Studies in the Waterton Lakes, Alberta,
W77-06680 5C

Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 1: Marine Mammals, Marine Birds.
W77-06793 6G

Baseline Characterization of Marine Mammals in the Bering Sea,
W77-06794 6G

Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

Distribution and Abundance of Bowhead and Belukha Whales in the Bering and Chukchi Seas,

W77-06804 6G

Baseline Studies of Fish and Shellfish Resources of Norton Sound and the Southeastern Chukchi Sea,
W77-06839 6G

Reconnaissance Characterization of Littoral Biota, Beaufort and Chukchi Seas,
W77-06843 6G

CHUKCHI SEA

Technical Trawl Survey of the Benthic Epifauna of the Chukchi Sea and Norton Sound.
W77-06848 6G

CHUM SALMON
The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

CINCINNATI METROPOLITAN SEWER DISTRICT (OH)
Cincinnati's Preventive Maintenance Sewer Program.
W77-06989 5G

CIRCULATION
Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

The Observed Winter Circulation of Lake Ontario,
W77-06655 2H

Effect of the Nile Flood on the Estuarine and Coastal Circulation Pattern Along the Mediterranean Egyptian Coast,
W77-06907 2L

CITY PLANNING
Design Study of Environmental and Human Cultural Information System Needs in Urban Water Resource Development,
W77-06634 6B

CLAMS
Razor Clam (Siliqua Patula, Dixon) Distribution and Population Assessment Study,
W77-06830 6G

Effects of Engineering Activities on the Ecology of Pismo Clams,
W77-06886 5C

CLAYS
Bonding of Calcium and Potassium by Vermiculite and Kaolinite Clays as Affected by H-Clay Addition,
W77-06872 2G

CLEANING
Cincinnati's Preventive Maintenance Sewer Program.
W77-06989 5G

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

Copper Sulfate Fights Root Growth in Sewer Systems,
W77-06991 8G

Contract Services Stretch Sewer Maintenance Budget,
W77-06994 8G

Backwashing of Granular Filters,
W77-07037 5D

CLEAR LAKE (CALIF)
The Use of Remote Sensing to Detect How Wind Influences Planktonic Blue-Green Algal Distribution,
W77-06697 5C

CLIMATES
Indicator Values of Vascular Plants in Central Europe, (In German),
W77-06803 2I

CLIMATOLOGY
Climatology for Geographers,
W77-06659 2B

Devon Island Ice Cap: Core Stratigraphy and Paleoclimate,
W77-06890 2C

CLINTON QUADRANGLE (OKLA)
Reconnaissance of the Water Resources of the Clinton Quadrangle, West-Central Oklahoma,
W77-06959 7C

CLOUD SEEDING
Weather Modification in the Soviet Union--1976,
W77-06644 3B

On the Status of Hail Suppression,
W77-06645 3B

CLYDE SEA (SCOTLAND)
An Estimate of the Input of Atmospheric Trace Elements into the North Sea and the Clyde Sea (1972-3),
W77-06668 5B

COAGULATION
Adsorption, Coagulation and Filtration Make a Useful Treatment Combination-Part 2,
W77-07077 5D

Renovated Water from Municipal Sewage Treatment Plants,
W77-07086 5D

COAL CONVERSION
Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

COAL LIQUEFICATION
Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

COAL MINE WASTES
Debris Basins for Control of Surface Mine Sedimentation,
W77-06672 5G

COASTAL ZONE MANAGEMENT
State Information Needs Related to Onshore and Nearshore Effects of OCS Petroleum Development,
W77-06934 6G

Who's Minding the Shore. A Citizens' Guide to Coastal Management,
W77-06935 5G

Coastal Zone Management, Annotated Bibliography,
W77-06937 2L

COASTS
Monitoring the Marine Environment Through Sedimentation,
W77-06651 2L

A Pilot Study on the Design of a Petroleum Hydrocarbon Baseline Investigation for Northern Puget Sound and Strait of Juan de Fuca,
W77-06875 5C

Continental Shelf Waves and Alongshore Variations in Bottom Topography and Coastline,
W77-06891 2L

Incipient Sediment Motion in Entrances with Shell Beds,
W77-06930 2L

Coastal Zone Management, Annotated Bibliography,
W77-06937 2L

COD
Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

COHO SALMON
Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

COLLECTIVE UTILITY
Collective Utility: A Systems Approach to Water Pricing Policy,
W77-06712 6C

COLORADO
New Design Gives Denver District Iron-Free Well,
W77-06868 8A

Water Quality Investigations in the South Platte River Basin, Colorado, 1971-72.
W77-07076 5A

COLORADO RIVER BASIN
Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

COLUMBIA RIVER
Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

Dissolved Nitrogen, Dissolved Oxygen and Related Water Temperatures in the Columbia and Lower Snake Rivers, 1965-1969,
W77-06925 5C

Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

COMBINED SEWERS
Chicago Drives Large Bores to Control Combined Sewage Flow.
W77-06988 8E

Single P/C Unit Removal of Nutrients from Combined Sewer Overflows,
W77-07031 5D

Treatment of Combined Sewer Overflows Via Thin Film Chemistry,
W77-07034 5D

Short Course Proceedings: Applications of Stormwater Management Models,
W77-07066 5B

On-Line Adaptive Control for Combined Sewer Systems,
W77-07100 5D

COMMUNICATION CHANNELS
Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

COMPARATIVE PRODUCTIVITY
The Effect of Different Methods on Growth, Development and Yield of Cotton, (In German),
W77-06962 3F

COMPOSTING
Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

COMPREHENSIVE PLANNING
A Comprehensive Plan for the Global Investigation of Pollution in the Marine Environment and Baseline Study Guidelines.
W77-06850 5A

COMPUTER MODELS
A General Model of Microbial Growth and Decomposition in Aquatic Ecosystems,
W77-06684 5C

Hybrid Computer Analysis of a Combined Surface Water--Groundwater System,
W77-06729 4B

Urbanization and Flooding in Shades Creek Basin, Jefferson County, Alabama,
W77-06977 4C

On-Line Adaptive Control for Combined Sewer Systems,
W77-07100 5D

COMPUTER PROGRAMS
Short Course Proceedings: Applications of Stormwater Management Models,
W77-07066 5B

CONDUCTIVITY
The Influence of Heated Effluent Waters on the Water Chemism of Konin Lakes, (In Polish),
W77-06753 5C

CONFERENCES
Conference on Research in Tunneling and Excavation Technology,
W77-06885 8E

Advanced Waste Treatment Seminar, Session III, Removal of Solids and Organics, Held at San Francisco, on October 28-29, 1970.
W77-07074 5D

CONJUCTIVE USE
Integration of Aquifers in Flood Control Projects,
W77-06723 4A

CONJUNCTIVE USE
The Conjunctive Use of a Multi-Reservoir System and a Dual-Purpose Desalting Plant,
W77-06714 4B

Conjunctive Use of the Tajo-Segura Aqueduct Surface System and the Aquifers of the La Mancha Area,
W77-06728 4B

Economic Analysis of Alternative Groundwater Withdrawal Rates in Conjunction with Surface Water Irrigation,
W77-06740 4B

CONNECTICUT
Monitoring Groundwater Quality: Illustrative Examples.
W77-06673 5A

CONOWINGO CREEK (MD-PA)
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

CONSERVATION
Place and Role of Plant Cover in Optimization of the Donbas Natural Environment, (In Ukranian),
W77-06858 4C

Energy Conservation and Heat Recovery in Waste Water Treatment Plants,
W77-07024 5D

CONSTRUCTION
Fast-Tracking Cuts Costs 16% on Advanced Waste Water Plant.
W77-07016 5D

Waste Water Treatment Plant Built in Wet Hole,
W77-07021 5D

CONSTRUCTION COSTS
Fast-Tracking Cuts Costs 16% on Advanced Waste Water Plant.
W77-07016 5D

Waste Water Treatment Plant Built in Wet Hole,
W77-07021 5D

CONSTRUCTION EQUIPMENT
Waste Water Treatment Plant Built in Wet Hole,
W77-07021 5D

CONSTRUCTION MATERIALS
Use of Remote Sensing to Quantify Construction Material and to Define Geologic Lineations; Dickey-Lincoln School Lakes Project, Maine,
W77-06888 8D

Waste Water Treatment Plant Built in Wet Hole,
W77-07021 5D

CONTINENTAL SHELF
Program Development Plan. Environmental Assessment of the Alaskan Continental Shelf,
W77-06878 6G

Continental Shelf Waves and Alongshore Variations in Bottom Topography and Coastline,
W77-06891 2L

An Analysis of Inertial Oscillations Observed Near Oregon Coast,
W77-06892 2L

Circulation and Hydrographic Structure Over the Ghana Continental Shelf During the 1974 Upwelling,
W77-06893 2L

CONTROL
Optimal Complex Use of Controlled Water Resources of a Basin,
W77-06718 4A

Design and Control of Secondary Settlement Tanks,
W77-07015 5D

CONTROL RULES
Streamflow Regulation by Artificial Recharge Fed from Upstream Surface Storage: Derivation of Control Rules,
W77-06725 4A

CONTROL STRUCTURES
Delineation of Flood Hazard Areas: Flood Hazard Report No. 2, Raritan River.
W77-06953 4A

CONTROL SYSTEMS
Study of Leachate at Landfill Sites 1975, Volume 1.
W77-06851 5B

CONTROLLED EXPERIMENTAL ECOSYSTEM
Zooplankton Sampling Variability: Controlled Ecosystem Pollution Experiment,
W77-06615 5A

Dynamics of Micro-Zooplankton Populations Treated with Copper: Controlled Ecosystem Pollution Experiment,
W77-06616 5A

Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

Experimental Observations on the Effects of Copper on Copepods and Other Zooplankton: Controlled Ecosystem Pollution Experiment,
W77-06619 5A

Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

Effects of Copper on Phytoplankton Standing Crop and Productivity: Controlled Ecosystem Pollution Experiment,
W77-06624 5A

CONTROLLED EXPERIMENTAL ECOSYSTEMS
Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

Effects of Copper on the Dominance and the Diversity of Algae: Controlled Ecosystem Pollution Experiment,
W77-06625 5A

Temperature, Salinity and Light Penetration Structures: Controlled Ecosystem Pollution Experiment,
W77-06626 5A

Loch Ewe Bag Experiment, 1974,
W77-06627 5A

COOLING WATER
Chlorine Reactions with Seawater Constituents and the Inhibition of Photosynthesis of Natural Marine Phytoplankton,
W77-06637 5C

The Influence of Heated Effluent Waters on the Thermal-Oxygen Relations and Water Transparency in the Konin Lakes Complex, (In Polish),
W77-06756 5C

COPEPODS
Experimental Observations on the Effects of Copper on Copepods and Other Zooplankton: Controlled Ecosystem Pollution Experiment,
W77-06619 5A

LIBRARY U. OF I. URBANA-CHAMP.

COPEPODS

Effects of Pressure, Temperature and Oxygen on the Oxygen-Consumption Rate of the Mid-water Copepod Gaussia Princeps,
W77-06642 5C

COPPER

Dynamics of Micro-Zooplankton Populations Treated with Copper: Controlled Ecosystem Pollution Experiment,
W77-06616 5A

Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

Experimental Observations on the Effects of Copper on Copepods and Other Zooplankton: Controlled Ecosystem Pollution Experiment,
W77-06619 5A

Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

Response of Natural Marine Bacterial Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06622 5A

Effects of Copper on Phytoplankton Standing Crop and Productivity: Controlled Ecosystem Pollution Experiment,
W77-06624 5A

Effects of Copper on the Dominance and the Diversity of Algae: Controlled Ecosystem Pollution Experiment,
W77-06625 5A

Loch Ewe Bag Experiment, 1974,
W77-06627 5A

The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

Correlation Coefficients and Concentration Factors of Copper and Lead in Seawater and Benthic Algae,
W77-06783 5C

COPPER ION

Response of Natural Marine Bacterial Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06622 5A

COPPER SULFATE

Copper Sulfate Fights Root Growth in Sewer Systems,
W77-06991 8G

CORAL

Evidence for Strong Currents and Turbulence in a Deep Coral Reef Groove,

W77-06993 8G

CORROSION CONTROL

How to Deal with Pitting and Corrosion.
W77-06869 8G

Control Sewer Corrosion with H2O2,
W77-06993 8G

COST ANALYSIS

Cost Comparison Between Subterrene and Current Tunneling Methods,
W77-06662 8A

Cost Comparison Between Subterrene and Current Tunneling Methods, Appendix A--Baseline Cost Analyses,
W77-06663 8A

Cost Comparison Between Subterrene and Current Tunneling Methods, Appendix B--Subterrene Cost Analyses,
W77-06664 8A

COST COMPARISONS

Cost Comparison Between Subterrene and Current Tunneling Methods,
W77-06662 8A

Cost Comparison Between Subterrene and Current Tunneling Methods, Appendix A--Baseline Cost Analyses,
W77-06663 8A

Cost Comparison Between Subterrene and Current Tunneling Methods, Appendix B--Subterrene Cost Analyses,
W77-06664 8A

COSTS

Subsurface Injection-How Much Does It Cost,
W77-07011 5E

Municipal Waste Water Treatment as an Industrial Operation,
W77-07025 5D

COTTON

The Effect of Different Methods on Growth, Development and Yield of Cotton, (In German),
W77-06962 3F

CRABTREE CREEK WATERSHED (NC)

Open Space and Urban Water Management - Phase II: Case Studies and Findings,
W77-06917 6B

CRANKCASE WASTES

Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

CROP MANAGEMENT PRACTICES

The Impact of Fertilizer Use and Crop Management on Nitrogen Content of Subsurface Water Draining from Upland Agricultural Watersheds,
W77-06909 5B

CROP PRODUCTION

The Significance of Regulating the Water Regime of Agricultural Lands, (In Russian),
W77-06837 3F

CROP RESPONSE

Salinity Effects on Rice After the Boot Stage,
W77-06871 3C

The Effect of Different Methods on Growth, Development and Yield of Cotton, (In German),
W77-06962 3F

CRUSTACEANS

Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

Algal Supplement Enhancement of Static and Recirculating System,
W77-06933 5C

CTENOPHORES

Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

CUBIC SPLINES

Smoothing Data with Cubic Splines,
W77-06831 7C

CULTIVATION

The Significance of Regulating the Water Regime of Agricultural Lands, (In Russian),
W77-06837 3F

CUNNERS

Respiratory Response of Cunners to Silver,
W77-06789 5C

CURRENTS (WATER)

Lake Currents and Temperatures Near the Western Shore of Lake Michigan,
W77-06687 2H

Evidence for Strong Currents and Turbulence in a Deep Coral Reef Groove,
W77-06904 2L

Effect of the Nile Flood on the Estuarine and Coastal Circulation Pattern Along the Mediterranean Egyptian Coast,
W77-06907 2L

CURVES

Tables and Type Curves for Analysis of Pump Tests in Leaky Parallel-Channel Aquifers,
W77-06941 4B

CUTTHROAT TROUT

A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

CYANOPHYTA

The Use of Remote Sensing to Detect How Wind Influences Planktonic Blue-Green Algal Distribution,

DELAWARE RIVER
Delaware River: Evidence for Its Former Extension to Wilmington Submarine Canyon,
W77-06966 2E

DELMARVA PENINSULA
Improving Estimates of Streamflow Characteristics Using LANDSAT-1 (ERTS-1) Imagery,
W77-06972 4A

DELTAS
Construction and Adjustment of a Two-Layer Mathematical Model of the Llobregat Delta,
W77-06722 4A

DEMONSTRATION WATERSHEDS
An Executive Summary of Three EPA Demonstration Programs in Erosion and Sediment Control,
W77-06671 5G

DENSITY STRATIFICATION
Waste Injection into Stratified Ground Water Bodies,
W77-06855 5B

DENVER (COLORADO)
New Design Gives Denver District Iron-Free Well,
W77-06868 8A

DEPTH-AREA CURVES
Area-Depth Relations for Frequency Values of Rainfall,
W77-06647 2B

DEPTH-AREA-DURATION ANALYSIS
Area-Depth Relations for Frequency Values of Rainfall,
W77-06647 2B

DESALINATION PLANTS
The Conjunctive Use of a Multi-Reservoir System and a Dual-Purpose Desalting Plant,
W77-06714 4B

DESIGN
Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

A Biological Monitoring System Employing Rheotaxis of Fish,
W77-06609 5C

An Electronic System to Monitor the Effects of Changes in Water Quality on Fish Opercular Rhythms,
W77-06610 5C

DESIGN CRITERIA
Design and Control of Secondary Settlement Tanks,
W77-07015 5D

Elimination of Anaerobic Digester Supernatant,
W77-07059 5D

Design Criteria for Waste Water Aerator Drives,
W77-07060 5D

Stabilisation Lagoons Including Experience in Brazil. Part 1,
W77-07063 5D

Advanced Waste Treatment Seminar, Session III, Removal of Solids and Organics, Held at San Francisco, on October 28-29, 1970.
W77-07074 5D

DESIGN FLOOD
Delineation of Flood Hazard Areas: Flood Hazard Report No. 2, Raritan River.
W77-06953 4A

DETERGENTS
Automated Method for the Determination of the Phosphorus Content of Detergents,
W77-06944 5A

DEVELOPING COUNTRIES (GROUNDWATER)
Preliminary Bibliography on Groundwater in Developing Countries,
W77-06852 2F

DEWATERING
Screenings Dewatering Press.
W77-07029 5D

Sludge Dewatering on Alaska's North Slope,
W77-07030 5D

The Use of Polymers for Improving Chemical Sludge Dewatering on Sand Beds,
W77-07033 5D

Anaerobic Filter Treats Waste Activated Sludge,
W77-07078 5D

Sludge Dewatering Pilot Plant Design. Part 2,
W77-07088 5D

Factors Influencing the Dewatering Characteristics of Sludge,
W77-07097 5D

DEWATERING PRESS
Screenings Dewatering Press.

DICKEY-LINCOLN SCHOOL LAKE PROJECT (ME)
Use of Remote Sensing to Quantify Construction Material and to Define Geologic Lineations; Dickey-Lincoln School Lakes Project, Maine,
W77-06888 8D

DIFFUSION COEFFICIENT
Evidence for Strong Currents and Turbulence in a Deep Coral Reef Groove,
W77-06904 2L

DIGHA (INDIA)
A Study to Forecast the Waves at Digha,
W77-06648 2L

DIPTERA
A Pneumatic Grab for Obtaining Large, Undisturbed Mud Samples: Its Construction and Some Applications for Measuring the Growth of Larvae and Emergence of Adult Chironomidae,
W77-06613 5A

The Influence of Effluent Heated Waters on the Bottom Fauna of Lakes in the Vicinity of Konin III. An Effort to Explain the Causes and Results of Changes in the Bottom Fauna of Lakes as Influenced by the Inflow of Heated Waters, (In Polish),
W77-06751 5C

DIRECT SEARCH METHOD
Streamflow Regulation by Artificial Recharge Fed from Upstream Surface Storage: Derivation of Control Rules,
W77-06725 4A

DISASTERS
Regulating Activities with Catastrophic Environmental Effects,
W77-06703 6G

DISCRIMINANT ANALYSIS
Phosphate Prediction Model for Streams by Means of Discriminant Analysis,
W77-06906 5B

DISEASES
Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

DISINFECTION
Water Decontamination in Northern Regions by Impulse Electric Charges, (In Russian),
W77-06791 5D

The Current Role of Wastewater Disinfection,
W77-07064 5D

DISPERSION
A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

Dispersion of Liquid Waste from a Moving Barge,
W77-06913 5B

DISSOLVED GAS CONTENT
Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

DISSOLVED GASES
Interstitial Water Chemistry of Anoxic Long Island Sound Sediments. 1. Dissolved Gases,
W77-06900 5B

DISSOLVED OXYGEN
Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

Dissolved Nitrogen, Dissolved Oxygen and Related Water Temperatures in the Columbia and Lower Snake Rivers, 1965-1969,
W77-06925 5C

Measurement in a Marine Environment Using Low Cost Sensors of Temperature and Dissolved Oxygen,
W77-06960 7B

DISSOLVED SOLIDS
Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

DISTRIBUTION
Zooplankton Sampling Variability: Controlled Ecosystem Pollution Experiment,
W77-06615 5A

Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

DISTRIBUTION PATTERNS
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

Temperature Relations of Puget Sound Thaids in Reference to Their Intertidal Distribution,
W77-06767 5C

Heat Resistance of Gametes of Marine Invertebrates in Relation to Temperature Conditions Under Which the Species Exist,
W77-06771 5C

Dispersal and Dispersion of Pond Snails in an Experimental Environment Varying to Three Factors, Singly and in Combination,
W77-06773 5C

The Natural History and Ecology of the Bearded Seal (Erignathus Barbatus) and the Ringed Seal (Phoca (Pusa) Hispida),
W77-06799 6G

Pelagic and Demersal Fish Assessment in the Lower Cook Inlet Estuary System,
W77-06829 6G

Razor Clam (Siliqua Patula, Dixon) Distribution and Population Assessment Study,
W77-06830 6G

Baseline/Reconnaissance Characterization, Littoral Biota, Gulf of Alaska and Bering Sea,
W77-06833 6G

Plankton of the Gulf of Alaska - Ichthyoplankton,
W77-06834 6G

Initial Zooplankton Investigations in Lower Cook Inlet,
W77-06835 6G

The Distribution, Abundance, Diversity, and Productivity of Benthic Organisms in the Gulf of Alaska,
W77-06841 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

DOMESTIC WASTES
Anaerobic Digestion and Membrane Separation for the Treatment of Domestic Sewage,
W77-06631 5D

Canwel Can Do,
W77-06985 5D

Hydrocarbon Products Manufacture--By Carbonisation of Coal, Scrap Rubber or Plastic or Domestic Sewage Under Reduced Pressure.
W77-07000 5D

The Plight and Promise of On-Site Waste Water Treatment,
W77-07010 5D

Adsorption, Coagulation and Filtration Make a Useful Treatment Combination-Part 2,
W77-07077 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

DONETSK (UKRANIAN SSR)
Experience in Treating Waste Waters from the Donetsk Mines, (In Russion),
W77-07068 5D

DORR TYPE CLARIFIER
Study on Sewage Flow Dynamics Through Dorr Type Clarifier on Stream, (Synopsis),
W77-07048 5D

DRAINAGE
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

Debris Basins for Control of Surface Mine Sedimentation,
W77-06672 5G

DRAINAGE SYSTEMS
London's Stormwater Problem,
W77-06983 5D

DRAWDOWN
Hydraulics and Economics of Well Field Layout.
W77-06863 8B

DRILLING EQUIPMENT
Make Wire Rope Last-Treat it Like a Machine,
W77-06857 8G

One Good Idea Spurs Another.
W77-06860 8C

DRILLING PIPE CLAMPS
One Good Idea Spurs Another.
W77-06860 8C

DROUGHT RESISTANCE
Some Significant Regularities in Plant Hydroadaptation, (In Russian),
W77-06774 3B

DROUGHT TOLERANCE
Some Significant Regularities in Plant Hydroadaptation, (In Russian),
W77-06774 3B

DRYING
Causes of the Drying up of Forests in the Flood Plain of the Lower Reaches of the Ural River, (In Russian),
W77-06801 4D

Drying Potato Wastes for Animal Feed as an Alternative Disposal Method.
W77-06947 5D

DYES
Investigation of Flushing Time in the Lafayette River, Norfolk, Virginia,
W77-06881 2L

DYNAMIC PROGRAMMING
The Conjunctive Use of a Multi-Reservoir System and a Dual-Purpose Desalting Plant,
W77-06714 4B

Optimization of a Three-Reservoir System by Dynamic Programming,
W77-06720 4A

Optimal Seasonal and Short-Term Operation of a Reservoir Used for Flood Control and Water Supply,
W77-06724 4A

Streamflow Regulation by Artificial Recharge Fed from Upstream Surface Storage: Derivation of Control Rules,
W77-06725 4A

The Methods of Distribution of Water Resources in River Development Systems,
W77-06726 4A

DYNAMICS
Study on Sewage Flow Dynamics Through Dorr Type Clarifier on Stream, (Synopsis),
W77-07048 5D

E COLI
Escherichia Coli as a Sanitary-Indicator Microorganism, (In Russian),
W77-07067 5A

ECHINODERMS
Stable Elements of Radioecological Importance in Certain Echinoderm Species,
W77-06640 5A

ECOLOGICAL DISTRIBUTION
Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 1: Marine Mammals, Marine Birds.
W77-06793 6G

Baseline Characterization of Marine Mammals in the Bering Sea,
W77-06794 6G

Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

Distribution and Abundance of Bowhead and Belukha Whales in the Bering and Chukchi Seas,
W77-06796 6G

The Natural History and Ecology of the Bearded Seal (Erignathus Barbatus) and the Ringed Seal (Phoca (Pusa) Hispida),
W77-06799 6G

An Aerial Census of Spotted Seals, Phoca Vitulina Largha,
W77-06800 6G

LIBRARY U. OF I. URBANA-CHAMPAIGN

ECOLOGICAL DISTRIBUTION

Identification, Documentation and Delineation of Coastal Migratory Bird Habitat in Alaska,
W77-06804 6G

Identification, Documentation, and Delineation of Coastal Migratory Bird Habitat in Alaska, and the Distribution, Abundance and Feeding Ecology of Birds Associated with Pack Ice,
W77-06805 6G

Ecosystem Dynamics Birds and Marine Mammals. Part I: Preliminary Estimates of Pinniped - Finfish Relationships in the Bering Sea,
W77-06806 6G

Ecosystem Dynamics Birds and Marine Mammals. Part II: Food Web Structure and Trophic Relations of Bering Sea Avifauna (Preliminary Report),
W77-06807 6G

Ecosystem Dynamics Birds and Marine Mammals. Part III: A Dynamic Numerical Marine Ecosystem Model for Evaluation of Marine Resources in Eastern Bering Sea,
W77-06808 6G

Reproductive Ecology of Pribilof Island Seabirds,
W77-06809 6G

Community Structure, Distribution, and Interrelationships of Marine Birds in the Gulf of Alaska,
W77-06810 6G

Shorebird Dependence on Arctic Littoral Habitats,
W77-06811 6G

Avifaunal Utilization of the Offshore Island Area Near Prudhoe Bay, Alaska,
W77-06812 6G

Birds of Coastal Habitat on the South Shore of Seward Peninsula, Alaska,
W77-06813 6G

Ecology and Behavior of Southern Hemisphere Shearwaters (Genus Puffinus) and Other Seabirds, When Over the Outer Continental Shelf of the Bering Sea and Gulf of Alaska During the Northern Summer,
W77-06814 6G

Seasonal Distribution and Abundance of Marine Birds,
W77-06815 6G

Preliminary Catalog of Seabird Colonies and Photographic Mapping of Seabird Colonies,
W77-06816 6G

Review and Analysis of Literature and Unpublished Data on Marine Birds,
W77-06817 6G

Migration of Birds in Alaska Coastal and Marine Habitats Subject to Influence by OCS Development,
W77-06818 6G

Feeding Ecology and Trophic Relationships of Alaskan Marine Bird, and Population Dynamics of Marine Birds,
W77-06819 6G

Avian Community Ecology at Two Sites on Espenberg Peninsula in Kotzebue Sound, Alaska. A Composite Study of: (1) Habitat Utilization and Breeding Ecology of Waterbirds, (2) Habitat Utilization and Breeding Ecology of Shorebirds and Nonwaterbird Species, and (3) Habitat Utilization, Breeding Ecology, and Feeding Ecology of Predators of Birds,
W77-06820 6G

Studies of Populations, Community Structure and Colony of Marine Birds at King Island, Bering Strait Region, Alaska,
W77-06821 6G

Avian Community Ecology of the Akulik - Inglutalik River Delta, Norton Bay, Alaska,
W77-06822 6G

A Comparative Sea-Cliff Bird Inventory of the Cape Thompson Vicinity, Alaska,
W77-06823 6G

Characterization of Coastal Habitat for Migratory Birds: Northern Bering Sea,
W77-06824 6G

ECOLOGY

Evaluation of the Environmental Impact to Appalachian Pennsylvania Waters of the 1972 Flood and Subsequent Stream Channelization with Future Policy Recommendations.
W77-06676 4A

Indicator Values of Vascular Plants in Central Europe, (In German),
W77-06803 2I

The Distribution, Abundance, Diversity and Productivity of Benthic Organisms in the Bering Sea,
W77-06826 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

Place and Role of Plant Cover in Optimization of the Donbas Natural Environment, (In Ukranian),
W77-06858 4C

ECONOMIC EFFICIENCY

Uncertainty and the Choice of Pollution Control Instruments,
W77-06704 6G

Hydraulics and Economics of Well Field Layout.
W77-06863 8B

Water Quality Management and the Distribution of Emission Rights by Sealed Tender Markets,
W77-06976 5E

ECONOMIC GROWTH

An Input-Output Analysis of Environmental Preservation,
W77-06706 6G

ECONOMICS

A Sector Model for Regional and National Water Resources Planning,
W77-06731 6A

Economic Analysis of Alternative Groundwater Withdrawal Rates in Conjunction with Surface Water Irrigation,
W77-06740 4B

ECOSYSTEMS

Ecosystem Dynamics Birds and Marine Mammals. Part I: Preliminary Estimates of Pinniped - Finfish Relationships in the Bering Sea,
W77-06806 6G

The Distribution, Abundance, Diversity and Productivity of Benthic Organisms in the Bering Sea,
W77-06826 6G

The Mammalian and Fish Fauna of the Nature Preserve of Martely, (In Hungarian),
W77-06838 6G

W77-06841 6G

Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea,
W77-06842 6G

Reconnaissance Characterization of Littoral Biota, Beaufort and Chukchi Seas,
W77-06843 6G

Ichthyoplankton of the Eastern Bering Sea,
W77-06845 6G

Assessment of Pelagic and Nearshore Fish in Three Bays on Southeast Kodiak Island,
W77-06846 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

Technical Trawl Survey of the Benthic Epifauna of the Chukchi Sea and Norton Sound.
W77-06848 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

ENVIRONMENTAL IMPACT STATEMENTS
Environmental Impact Statements in Water Resources Planning and Decision Making,
W77-06738 6E

Guidelines for the Preparation of Environmental Reports for Fossil-Fueled Steam Electric Generating Stations,
W77-06918 6G

ENVIRONMENTAL QUALITY
An Input-Output Analysis of Environmental Preservation,
W77-06706 6G

Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

ENVIRONMENTAL SANITATION
Trends in Sludge Treatment and Disposal Practices in the United States,
W77-07083 5D

ENZYMES
Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

EPA STORMWATER MANAGEMENT MODEL (SWMM)
Short Course Proceedings: Applications of Stormwater Management Models,
W77-07066 5B

EQUATIONS
Simple Formulae for the Estimation of Wet Bulb Temperature and Precipitable Water,
W77-06646 2B

EQUATIONS

Profiles and Evaporation,
W77-06898 2D

A Universal Calibration Equation for Price Meters and Similar Instruments,
W77-06943 7B

Comparison of Iterative Methods of Solving Two-Dimensional Groundwater Flow Equations,
W77-06965 2F

EQUIPMENT

Electrically Powered Sampler for Benthic Macroinvertebrates,
W77-06757 7B

Testing and Grouting Leaking Joints,
W77-06986 8G

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

Electron-Beam Irradiation of Waste Products--e.g., For Sterilization of Sewage Sludge and Waste Industrial Products.
W77-06997 5D

EROSION

Characteristics of Water Flow at the North End of the Wassaw Barrier Island Complex. Wassaw Island Erosion Study, Part II,
W77-06939 2J

Changing Needs and Opportunities in the Sediment Field,
W77-06964 2J

EROSION CONTROL

An Executive Summary of Three EPA Demonstration Programs in Erosion and Sediment Control,
W77-06671 5G

Debris Basins for Control of Surface Mine Sedimentation,
W77-06672 5G

Antierosion Role of Forest Plantings in the Steppe Zone of the Moldavian SSR, (In Russian),
W77-06745 4C

Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

Diminution Ratios for Planning Construction-Area Sediment Controls,
W77-06980 4D

EROSION HAZARD

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

ESTIMATING

Current Methods Used in the Soil Conservation Service to Estimate Sediment Yield,
W77-06657 4D

ESTUARIES

The Fauna of the Polluted River Tees Estuary,
W77-06638 5C

Beaufort Sea Estuarine Fishery Study,
W77-06840 6G

Investigation of Flushing Time in the Lafayette River, Norfolk, Virginia,
W77-06881 2L

The Influence of Wind on the Surface Layer of a Stratified Inlet: Part I. Observations,
W77-06894 2L

The Influence of Wind on the Surface Layer of a Stratified Inlet: Part II. Analysis,
W77-06895 2L

A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

Incipient Sediment Motion in Entrances with Shell Beds,
W77-06930 2L

Mississippi Sound Temporal and Spatial Distribution of Nutrients,
W77-06932 5B

Coastal Zone Management, Annotated Bibliography,
W77-06937 2L

Blank and Salinity Corrections for Automated Nutrient Analysis of Estuarine and Sea Waters,
W77-06938 5A

Measurement in a Marine Environment Using Low Cost Sensors of Temperature and Dissolved Oxygen,
W77-06960 7B

ETHANOL

Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

EUPHOTIC ZONE

Temperature, Salinity and Light Penetration Structures: Controlled Ecosystem Pollution Experiment,
W77-06626 5A

EUROPE

Indicator Values of Vascular Plants in Central Europe, (In German),
W77-06803 2I

EUTROPHICATION

Presenting Trends in Lake Eutrophication,
W77-06693 5C

Long-Term Changes of the Pelagic Primary Production in Heated Lakes, (In Polish),
W77-06755 5C

Distribution and Indicatory Value of the Submerged Macrophytes in the Flowing Waters of the Friedberger Au, (In German),
W77-06802 5C

Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

Nutrient Removal by Water Hyacinths,
W77-07036 5G

EVALUATION

A Sector Model for Regional and National Water Resources Planning,
W77-06731 6A

Hydrological Evaluation of Changes in Runoff Characteristics,
W77-06732 4A

EVAPORATION

Lake St. Clair Hydrologic Transfer Factors.
W77-06879 2H

Evaporation and Advection II: Evaporation Downwind of a Boundary Separating Regions Having Different Surface Resistances and Available Energies,
W77-06897 2D

Profiles and Evaporation,
W77-06898 2D

Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W77-06973 2D

EXCAVATION

Conference on Research in Tunneling and Excavation Technology,
W77-06885 8E

EXPERIMENTAL SYSTEM IDENTIFICATION

On the Application of Optimization Techniques to Conceptual Catchment Models,
W77-06709 2A

FALLOUT

The Distribution of Natural and Anthropogenic Elements and Compounds in Precipitation Across the U.S.; Theory and Quantitative Models,
W77-06675 2B

FARM LAGOONS

Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

FARM WASTES

Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

FECUNDITY

Notes on the Nesting Success and Fecundity of the Anemonefish Amphiprion Clarkii at Miyake-Jima, Japan,
W77-06763 5C

FEEDS

Drying Potato Wastes for Animal Feed as an Alternative Disposal Method.
W77-06947 5D

FERTILIZATION

Potassium in an Arid Loessial Soil: Changes in Availability as Related to Cropping and Fertilization,
W77-06870 3F

FERTILIZERS
Potassium in an Arid Loessial Soil: Changes in Availability as Related to Cropping and Fertilization,
W77-06870 3F

The Impact of Fertilizer Use and Crop Management on Nitrogen Content of Subsurface Water Draining from Upland Agricultural Watersheds,
W77-06909 5B

Agricultural Disposal of Aerobic Wastewater Sludges in an Urban County,
W77-07057 5D

FIBERGLASS WELL CASING
New Design Gives Denver District Iron-Free Well,
W77-06868 8A

FIELD CAPACITY
A Method of Evaluating a Field Water Capacity Using PF-3, (In French),
W77-06844 2G

FILMS
Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

FILTERS
Backwashing of Granular Filters,
W77-07037 5D

Anaerobic Filter Treats Waste Activated Sludge,
W77-07078 5D

FILTRATION
Backwashing of Granular Filters,
W77-07037 5D

Characterization of Soluble Organic Matter in Leachate,
W77-07039 5A

Adsorption, Coagulation and Filtration Make a Useful Treatment Combination-Part 2,
W77-07077 5D

Process Technological Background Regarding New Protective Regulations of Water Bodies-Results of Nitrification and Phosphorus Elimination Experiments in Zurich and Bern. III. Filtration by Flocculation for the Elimination of Phosphorus from Communal Waste Water (Verfahrenstechnische Unterlagen im Hinblick auf die neuen Gewaesserschutzanforderungen-Ergebnisse der Versuche ueber die Nitrifikation und Phosphorelimination in Zuerich und Bern. III. Flockungsfiltration zur Elimination von Phosphor aus Kommunalem Abwasser),
W77-07082 5D

FINITE-DIFFERENCE EQUATIONS
Comparison of Iterative Methods of Solving Two-Dimensional Groundwater Flow Equations,
W77-06965 2F

FISH
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

FISH BARRIERS
Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

FISH BEHAVIOR
A Biological Monitoring System Employing Rheotaxis of Fish,
W77-06609 5C

Field Tests of Isobornyl Thiocyanoacetate (Thanite) for Live Collection of Fishes,
W77-06747 5C

A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

FISH DISEASE
A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

FISH DISEASES
Fish Diseases and Parasites in Relation to the Environment,
W77-06744 5C

Gas Bubble Disease of Salmonids: A Critical Review,
W77-06920 5

First Reported Incidence of Gas-Bubble Disease in the Heated Effluent of a Steam Generating Station,
W77-06922 5C

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

FISH EGGS
Effect of Malachite Green and Formalin on the Survival of Largemouth Bass Eggs and Fry,
W77-06612 5C

Toxicity of Rotenone to Fish in Standardized Laboratory Tests,
W77-06748 5C

FISH FITNESS
Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

FISH FOOD ORGANISMS
The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

FISH HATCHERIES
Ammonia Concentration in Relation to Ammonia Toxicity During a Rainbow Trout Rearing Experiment in a Closed Freshwater-Seawater System,
W77-06743 5C

Gas Bubble Disease of Salmonids: A Critical Review,
W77-06920 5

FISH KILL
First Reported Incidence of Gas-Bubble Disease in the Heated Effluent of a Steam Generating Station,
W77-06922 5C

FISH MIGRATION
Spawning Herring Surveys in the Bering Sea and Finfish Resource Surveys in Norton Sound and Kotzebue Sound,
W77-06828 6G

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

FISH PATHOLOGY
First Reported Incidence of Gas-Bubble Disease in the Heated Effluent of a Steam Generating Station,
W77-06922 5C

FISH PHYSIOLOGY
The Accumulation of Organic Mercury from Sea Water by the Plaice, Pleuronectes platessa L.,
W77-06607 5C

Tissue Accumulation and Enzymatic Effects of Hexavalent Chromium in Rainbow Trout (Salmo Gairdneri),
W77-06639 5C

Fish Diseases and Parasites in Relation to the Environment,
W77-06744 5C

Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

FISH POPULATIONS
Spawning Herring Surveys in the Bering Sea and Finfish Resource Surveys in Norton Sound and Kotzebue Sound,
W77-06828 6G

Pelagic and Demersal Fish Assessment in the Lower Cook Inlet Estuary System,
W77-06829 6G

FISHES
Assessment of Pelagic and Nearshore Fish in Three Bays on Southeast Kodiak Island,
W77-06846 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

FLAME IONIZATION DETECTOR
Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

FLAVORS (FISH)
Identity, Origin and Development of Off-Flavors in Great Lakes Anadromous Fish,
W77-06931 5A

FLOCCULATION
Some Factors Affecting Floc Formation by Zoogloea Ramigera, Strain I-16-M,
W77-07042 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

FLOCCULATION

Process Technological Background Regarding New Protective Regulations of Water Bodies-Results of Nitrification and Phosphorus Elimination Experiments in Zurich and Bern. III. Filtration by Flocculation for the Elimination of Phosphorus from Communal Waste Water (Verfahrenstechnische Unterlagen im Hinblick auf die neuen Gewaesserschutzanforderungen-Ergebnisse der Versuche ueber die Nitrifikation und Phosphorelimination in Zuerich und Bern. III. Flockungsfiltration zur Elimination von Phosphor aus Kommunalem Abwasser),

Analog-Model Simulations for Secondary Canal Controls and Forward Pumping Water-Management Schemes in Southeast Florida,
W77-06968 4B

Expansion Comes Quickly to AWT Plant,
W77-07009 5D

FLOW

Optimal Planning of Flows in Multi-Reservoir Hydro-Power Systems,
W77-06730 4A

FLOW CONTROL

Analog-Model Simulations for Secondary Canal Controls and Forward Pumping Water-Management Schemes in Southeast Florida,
W77-06968 4B

Evaluation of In-Line and Side-Line Flow Equalization Systems,
W77-07041 5D

FLOW EQUALIZATION

Evaluation of In-Line and Side-Line Flow Equalization Systems,
W77-07041 5D

FLOW RATES

Evaluation of In-Line and Side-Line Flow Equalization Systems,
W77-07041 5D

FLOW SEPARATION

Study on Sewage Flow Dynamics Through Dorr Type Clarifier on Stream, (Synopsis),
W77-07048 5D

FLUCTUATIONS

Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

FLUORIDES

Toxicity of Fluoride to Brown Trout Fry (Salmo trutta),
W77-06628 5C

FLUOSOLIDS

Fluosolids Incinerator Commissioned at Esher,
W77-07018 5E

FLUSHING

Investigation of Flushing Time in the Lafayette River, Norfolk, Virginia,
W77-06881 2L

FOAM

Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

FOG

Compressed Air for Supercooled Fog Dispersal,
W77-06674 3B

FOG DISPERSAL

Compressed Air for Supercooled Fog Dispersal,
W77-06674 3B

FOOD CHAINS
A Study on the Role of Herbivorous Zooplankton Community as Primary Consumers of Phytoplankton in Dutch Lakes,
W77-06695 5C

FOOD HABITS
Ecosystem Dynamics Birds and Marine Mammals. Part II: Food Web Structure and Trophic Relations of Bering Sea Avifauna (Preliminary Report),
W77-06807 6G

FOOD WEBS
Ecosystem Dynamics Birds and Marine Mammals. Part II: Food Web Structure and Trophic Relations of Bering Sea Avifauna (Preliminary Report),
W77-06807 6G

FORECASTING
Sediment Yield Prediction Based on Watershed Hydrology,
W77-06656 4D

Forecasting Floods in Hawaii (Excluding Hawaii Island),
W77-06873 4A

A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

Phosphate Prediction Model for Streams by Means of Discriminant Analysis,
W77-06906 5B

Hydraulics of Sheet Flow in Wetlands,
W77-06929 8B

FOREST MANAGEMENT
Antierosion Role of Forest Plantings in the Steppe Zone of the Moldavian SSR, (In Russian),
W77-06745 4C

FORESTS
A Note on Temperature and Humidity Profile Measurement Over Forests Using Diodes,
W77-06653 7B

Investigation of Precipitation Within Forest Ecosystems, (In Hungarian),
W77-06797 2B

Causes of the Drying up of Forests in the Flood Plain of the Lower Reaches of the Ural River, (In Russian),
W77-06801 4D

A Model for the Water Regime of a Deciduous Forest with Special Consideration of the Functional Interrelationships Among Meteorological Factors, Soil Water Content and Evapotranspiration, (In German),
W77-06864 2A

ORMALIN
Effect of Malachite Green and Formalin on the Survival of Largemouth Bass Eggs and Fry,
W77-06612 5C

ORMIC ACID
Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

ORMULAS
Simple Formulae for the Estimation of Wet Bulb Temperature and Precipitable Water,
W77-06646 2B

FOSSIL FUELS
Guidelines for the Preparation of Environmental Reports for Fossil-Fueled Steam Electric Generating Stations,
W77-06918 6G

FREEZING SOILS
Suprapermafrost Water,
W77-06630 2C

FREQUENCY ANALYSIS
Floods in Louisiana, Magnitude and Frequency, Third Edition,
W77-06979 2E

FRESHWATER
Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

FRESHWATER FISH
Tissue Accumulation and Enzymatic Effects of Hexavalent Chromium in Rainbow Trout (Salmo Gairdneri),
W77-06639 5C

Experiment with a Multipoint System for Judging Carp Fattening Ponds, (In Russian),
W77-06798 2H

FRY
Effect of Malachite Green and Formalin on the Survival of Largemouth Bass Eggs and Fry,
W77-06612 5C

Toxicity of Fluoride to Brown Trout Fry (Salmo trutta),
W77-06628 5C

FUELS
Fuel Gas and Electricity from Municipal Sewage,

FUNGI
Effect of Salinity on Spore Germination of Terrestrial and Marine Fungi,
W77-06772 5C

Adenosine Triphosphate (ATP) Levels in Microbial Cultures and a Review of the ATP Biomass Estimation Technique,
W77-06942 5A

FUNGICIDES
Effect of Malachite Green and Formalin on the Survival of Largemouth Bass Eggs and Fry,
W77-06612 5C

Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

GAMMA RAY TREATMENT
Treatment of Sewage by Electrons and Gammas,
W77-07012 5D

GAS BUBBLE DISEASE
A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

Gas Bubble Disease of Salmonids: A Critical Review,
W77-06920 5

Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

GAS BUBBLE DISEASES
First Reported Incidence of Gas-Bubble Disease in the Heated Effluent of a Steam Generating Station,
W77-06922 5C

GAS CHROMATOGRAPHY
Determination of Free Formic and Acetic Acids by Gas Chromatography Using the Flame Ionization Detector,
W77-06961 5A

GASES
Fuel Gas and Electricity from Municipal Sewage,
W77-07065 5D

GASTROPODS
The Fauna of the Polluted River Tees Estuary,
W77-06638 5C

GENERAL EQUILIBRIUM ANALYSIS
A Dynamic Multisector Programming Approach to Regional Water Resource Management,
W77-06737 6A

GEOGRAPHY
Climatology for Geographers,
W77-06659 2B

GEOLOGIC LINEATIONS
Use of Remote Sensing to Quantify Construction Material and to Define Geologic Lineations; Dickey-Lincoln School Lakes Project, Maine,
W77-06888 8D

GEORGIA
Loss of 2,4-D in Runoff from Plots Receiving Simulated Rainfall and from a Small Agricultural Watershed,
W77-06908 5B

Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

GEOTHERMAL BRINES
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

GEOTHERMAL STUDIES
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

GEOTHERMAL WATERS
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

GERMANIUM DIODES
A Note on Temperature and Humidity Profile Measurement Over Forests Using Diodes,
W77-06653 7B

LIBRARY U. OF I. URBANA-CHAMPAIGN

GERMANY
Phosphate Prediction Model for Streams by Means of Discriminant Analysis,
W77-06906 5B

GHANA
Circulation and Hydrographic Structure Over the Ghana Continental Shelf During the 1974 Upwelling,
W77-06893 2L

GLADSTONE (MO)
Contract Services Stretch Sewer Maintenance Budget,
W77-06994 8G

GLUSZYCA (POLAND)
Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

GRADATION
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

GRADIENTS (STREAMS)
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

GRANDE RONDE DRAINAGE BASIN (OR)
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

GRAZING
Experimental Observations on the Effects of Copper on Copepods and Other Zooplankton: Controlled Ecosystem Pollution Experiment,
W77-06619 5A

GREAT LAKES
The Observed Winter Circulation of Lake Ontario,
W77-06655 2H

GROUNDWATER
Monitoring Groundwater Quality: Illustrative Examples.
W77-06673 5A

Depth and Seasonal Fluctuations in the Condition of the Groundwater of the Area Around the City of Ghent (Belgium), (In Dutch),
W77-06681 2G

Irrigation of the Nebit-Dag Plantings by Mineralized Ground Water, (In Russian),
W77-06691 3C

Hybrid Computer Analysis of a Combined Surface Water--Groundwater System,
W77-06729 4B

Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

Preliminary Bibliography on Groundwater in Developing Countries,
W77-06852 2F

GROUNDWATER MINING
Economic Analysis of Alternative Groundwater Withdrawal Rates in Conjunction with Surface Water Irrigation,
W77-06740 4B

GROUNDWATER MOVEMENT
Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

Comparison of Iterative Methods of Solving Two-Dimensional Groundwater Flow Equations,
W77-06965 2F

Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W77-06975 5B

Application of Digital Modelling to the Prediction of Radioisotope Migration in Groundwater,
W77-06981 5B

GROUNDWATER RECHARGE
Performance of a Recharge and Recovery System in an Aquifer with Uniform Flow,
W77-06905 2F

GROUNDWATER RESOURCES
On Large-Scale Simulation of Groundwater Flow Systems,
W77-06713 4B

Reconnaissance of the Water Resources of the Clinton Quadrangle, West-Central Oklahoma,
W77-06959 7C

Hydrologic Interpretation of Geophysical Data from the Southeastern Hueco Bolson, El Paso and Hudspeth Counties, Texas,
W77-06970 4B

GROUTING
Testing and Grouting Leaking Joints,
W77-06986 8G

GROWTH RATES
Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

UNOX System for Waste Water Treatment,
W77-07014 5D

Some Factors Affecting Floc Formation by Zoogloea Ramigera, Strain I-16-M,
W77-07042 5D

GULF OF ALASKA
Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

Identification, Documentation and Delineation of Coastal Migratory Bird Habitat in Alaska,
W77-06804 6G

Community Structure, Distribution, and Interrelationships of Marine Birds in the Gulf of Alaska,
W77-06810 6G

Ecology and Behavior of Southern Hemisphere Shearwaters (Genus Puffinus) and Other Seabirds, When Over the Outer Continental Shelf of the Bering Sea and Gulf of Alaska During the Northern Summer,
W77-06814 6G

Seasonal Distribution and Abundance of Marine Birds,
W77-06815 6G

Feeding Ecology and Trophic Relationships of Alaskan Marine Bird, and Population Dynamics of Marine Birds,
W77-06819 6G

Resources of Non-Salmonid Pelagic Fish of the Eastern Bering Sea and the Gulf of Alaska,
W77-06832 6G

Baseline/Reconnaissance Characterization, Littoral Biota, Gulf of Alaska and Bering Sea,
W77-06833 6G

Plankton of the Gulf of Alaska - Ichthyoplankton,
W77-06834 6G

Phytoplankton and Primary Productivity in the Northeast Gulf of Alaska,
W77-06836 6G

The Distribution, Abundance, Diversity, and Productivity of Benthic Organisms in the Gulf of Alaska,
W77-06841 6G

Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea,
W77-06842 6G

HABITATS
Characterization of Coastal Habitat for Migratory Birds: Northern Bering Sea,
W77-06824 6G

Baseline/Reconnaissance Characterization, Littoral Biota, Gulf of Alaska and Bering Sea,
W77-06833 6G

HAIL
Weather Modification in the Soviet Union--1976,
W77-06644 3B

On the Status of Hail Suppression,
W77-06645 3B

HAIL SUPPRESSION
Weather Modification in the Soviet Union--1976,
W77-06644 3B

On the Status of Hail Suppression,
W77-06645 3B

HARDNESS (WATER)
Toxicity of Fluoride to Brown Trout Fry (Salmo trutta),
W77-06628 5C

HARZ MOUNTAINS (FEDERAL REPUBLIC OF GERMANY)
Optimal Operations of Reservoirs in the Harz Mountains,
W77-06715 4A

HAWAII
Forecasting Floods in Hawaii (Excluding Hawaii Island),
W77-06873 4A

HEAT
Energy Conservation and Heat Recovery in Waste Water Treatment Plants,
W77-07024 5D

HEAT PUMPS
Energy Conservation and Heat Recovery in Waste Water Treatment Plants,
W77-07024 5D

HEAT SINKS
An Annular Flow Ice-Water Model Heat Sink,
W77-06889 2C

HEAT TREATMENT
Anaerobic Filter Treats Waste Activated Sludge,
W77-07078 5D

HEATED WATER
Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

HEAVY METALS
Dynamics of Micro-Zooplankton Populations Treated with Copper: Controlled Ecosystem Pollution Experiment,
W77-06616 5A

Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

Experimental Observations on the Effects of Copper on Copepods and Other Zooplankton: Controlled Ecosystem Pollution Experiment,
W77-06619 5A

Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

Response of Natural Marine Bacterial Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06622 5A

Effects of Copper on Phytoplankton Standing Crop and Productivity: Controlled Ecosystem Pollution Experiment,
W77-06624 5A

Effects of Copper on the Dominance and the Diversity of Algae: Controlled Ecosystem Pollution Experiment,
W77-06625 5A

Loch Ewe Bag Experiment, 1974,
W77-06627 5A

The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

The Toxic Effects of Selected Heavy Metals on Unadapted Populations of Vorticella Convallaria Var Similis,
W77-06636 5C

Heavy Metals in Macroinvertebrates and Fish from the Lower Medway Estuary, Kent,
W77-06790 5C

Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

Accumulation of Heavy Metals in Soils from Extended Waste Water Irrigation,
W77-07049 5B

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

HELIX ASPERSA
The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

HEMATOLOGY
Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

HERBICIDES
Loss of 2,4-D in Runoff from Plots Receiving Simulated Rainfall and from a Small Agricultural Watershed,
W77-06908 5B

HEXAVALENT CHROMIUM
Tissue Accumulation and Enzymatic Effects of Hexavalent Chromium in Rainbow Trout (Salmo Gairdneri),
W77-06639 5C

HIGHWAYS
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

HISTOLOGY
Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

HISTORIC FLOODS
Floods in Louisiana, Magnitude and Frequency, Third Edition,
W77-06979 2E

HISTORY
Delaware River: Evidence for Its Former Extension to Wilmington Submarine Canyon,
W77-06966 2E

HUMIDITY
A Note on Temperature and Humidity Profile Measurement Over Forests Using Diodes,
W77-06653 7B

HUNGARY (MARTELY)
The Mammalian and Fish Fauna of the Nature Preserve of Martely, (In Hungarian),
W77-06838 6G

HURRICANE AGNES
Evaluation of the Environmental Impact to Appalachian Pennsylvania Waters of the 1972 Flood and Subsequent Stream Channelization with Future Policy Recommendations.
W77-06676 4A

HURRICANE AGNES (1972)
Flood Management Study.
W77-06952 6F

HYBRID COMPUTERS
Hybrid Computer Analysis of a Combined Surface Water--Groundwater System,
W77-06729 4B

HYDRAULIC CONDUCTIVITY
Suprapermafrost Water,
W77-06630 2C

HYDRAULIC HEAD
A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

HYDRAULIC SYSTEMS
Pumping Systems: The Simpler, The Better,
W77-06856 8C

HYDRO-POWER SYSTEMS
Optimal Planning of Flows in Multi-Reservoir Hydro-Power Systems,
W77-06730 4A

HYDROCRYLE
The Influence of Acrolein and Hydrocryle on the Development Dynamics of Aquatic Bacteria,
W77-06690 5C

HYDROGEN PEROXIDE
Control Sewer Corrosion with H2O2,
W77-06993 8G

HYDROGEN SULFIDE
Control Sewer Corrosion with H2O2,
W77-06993 8G

Biogenic Elements and Sulfate Reduction in Water Oil Carbonate Layer, (In Russian),
W77-07040 5B

HYDROGEOLOGY
Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W77-06975 5B

HYDROLOGIC BUDGET
Water in the Palouse River Basin, Washington,
W77-06978 4B

HYDROLOGIC CYCLE
Comprehensive Monitoring of Meteorology, Hydraulics, and Thermal Regime of the San Diego Aqueduct, California,
W77-06973 2D

HYDROLOGY
Sediment Yield Prediction Based on Watershed Hydrology,
W77-06656 4D

Mathematical Models in Hydrology.
W77-06708 2A

Optimization of a Three-Reservoir System by Dynamic Programming,
W77-06720 4A

Hydrological Evaluation of Changes in Runoff Characteristics,
W77-06732 4A

HYDROMETRIC NETWORKS
Use of a Parametric Model as a Tool for Hydrometric Network Planning,
W77-06710 2A

HYDROPLANTS
Optimization Model of a System of Two Open-Channel Hydroplants,
W77-06716 4A

HYPHOMYCETES
Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

ICE
Laboratory Study of the Flexural Strength and Elastic Modulus of Freshwater and Saline Ice,
W77-06661 2C

LIBRARY U. OF I. URBANA-CHAMPAIGN

ICE

An Annular Flow Ice-Water Model Heat Sink,
W77-06889 2C

Devon Island Ice Cap: Core Stratigraphy and Paleoclimate,
W77-06890 2C

ICE CAPS
Devon Island Ice Cap: Core Stratigraphy and Paleoclimate,
W77-06890 2C

ICE-WATER INTERFACES
An Annular Flow Ice-Water Model Heat Sink,
W77-06889 2C

ILLINOIS
Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

Underflow from Sludge-Irrigated Cropland,
W77-07056 5B

IMPULSE ELECTRIC CHARGES
Water Decontamination in Northern Regions by Impulse Electric Charges, (In Russian),
W77-06791 5D

INCINERATION
Burning Waste Chlorinated Hydrocarbons in a Cement Kiln,
W77-06946 5E

Fluosolids Incinerator Commissioned at Esher,
W77-07018 5E

INCINERATORS
Sludge Incineration at Esher.
W77-07020 5E

INCUBATION
Egg Incubation and Larval Rearing of Navaga (Eleginus Navaga Pall.), Polar Cod (Boreogadus Saida Lepechin) and Arctic Flounder (Liopsetta Glacialis Pall.) in the Laboratory,
W77-06792 8I

INDIA
Area-Depth Relations for Frequency Values of Rainfall,
W77-06647 2B

A Study to Forecast the Waves at Digha,
W77-06648 2L

INDIAN RESERVATIONS
Preliminary Assessment of the Water Resources of the Tulalip Indian Reservation, Washington,
W77-06971 4A

INDIANA
A Study of the Utilization of EREP Data from the Wabash River Basin,
W77-06670 7B

Growth and Movement of Fish in the Vicinity of a Thermal Discharge,
W77-06766 5C

Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

INDICATORS
Distribution and Indicatory Value of the Submerged Macrophytes in the Flowing Waters of the Friedberger Au, (In German),
W77-06802 5C

INDUSTRIAL WASTES
Dispersion of Liquid Waste from a Moving Barge,
W77-06913 5B

Activated Sludge Treatment of High Strength NSSC Mill Effluent,
W77-06945 5D

Water Quality Management and the Distribution of Emission Rights by Sealed Tender Markets,
W77-06976 5E

Municipal Waste Water Treatment as an Industrial Operation,
W77-07025 5D

Plastic Spheres for Waste Water Treatment.
W77-07028 5D

Hygienic Effectiveness of Measures for Decontaminating Effluents at Petrochemical Plants, (In Russian),
W77-07069 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

INERTIAL OSCILLATIONS
An Analysis of Inertial Oscillations Observed Near Oregon Coast,
W77-06892 2L

INFILTRATION
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

INFILTRATION RATES
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

INFLOW
Hydrochemistry of the Lake Magadi Basin, Kenya,
W77-06967 2K

INFORMATION EXCHANGE
Design Study of Environmental and Human Cultural Information System Needs in Urban Water Resource Development,
W77-06634 6B

Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

INFRASTRUCTURE
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

INJECTION
Subsurface Injection-How Much Does It Cost,
W77-07011 5E

INJECTION WELLS
Waste Injection into Stratified Ground Water Bodies,
W77-06855 5B

INLETS (WATERWAYS)
The Influence of Wind on the Surface Layer of a Stratified Inlet: Part I. Observations,
W77-06894 2L

The Influence of Wind on the Surface Layer of a Stratified Inlet: Part II. Analysis,
W77-06895 2L

Characteristics of Water Flow at the North End of the Wassaw Barrier Island Complex. Wassaw Island Erosion Study, Part II,
W77-06939 2L

INORGANIC COMPOUNDS
Water Quality Simulation of Tahoe-Truckee System, Nevada-California-Volume I,
W77-07075 5B

INPUT-OUTPUT ANALYSIS
The Generation of Residual Flows in Norway An Input-Output Approach,
W77-06698 5C

An Input-Output Analysis of Environmental Preservation,
W77-06706 6C

Economic Analysis of Alternative Groundwater Withdrawal Rates in Conjunction with Surface Water Irrigation,
W77-06740 4B

INSECTICIDES
Field Tests of Isobornyl Thiocyanoacetate (Thanite) for Live Collection of Fishes,
W77-06747 5C

INSECTS
The Mining Fauna in Four Macrophyte Species in Mikolajskie Lake,
W77-06688 5C

INSPECTION
Cincinnati's Preventive Maintenance Sewer Program.
W77-06989 5D

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8A

INSTRUMENTATION
Coastal Meteorological Networks to Determine Effects of Nuclear Plant Cooling Systems,
W77-06643 7C

A Study of the Utilization of EREP Data from the Wabash River Basin,
W77-06670 7B

A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

Optic Device for Observations of Small Organisms Under Water, (In Russian),
W77-06926 7B

A Universal Calibration Equation for Price Meters and Similar Instruments,
W77-06943 7B

Hydrologic Interpretation of Geophysical Data from the Southeastern Hueco Bolson, El Paso and Hudspeth Counties, Texas,
W77-06970 4B

New Programs Improve Sensitive Areas of Water and Sewer Systems,
W77-06995 8G

INTERCEPTOR SEWERS
Sewerage for a Rural Resort Area,
W77-06987 5D

INTERMEDIATE REGIONAL FLOOD
Flood Hazard Information: Cave Creek, Arizona Canal to 19th Avenue, Phoenix, Arizona.
W77-06954 4A

INTERMUNICIPAL TAX SHARING
Flood Management Study.
W77-06952 6F

INTERNAL TIDES
Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

INTERNAL WAVES
An Analysis of Inertial Oscillations Observed Near Oregon Coast,
W77-06892 2L

INVERTEBRATES
The Effects of Methoxychlor on Riffle Invertebrate Populations and Communities,
W77-06614 5C

Ecological Relations Between Invertebrates and Submerged Macrophytes in the Lake Littoral,
W77-06694 5C

Heat Resistance of Gametes of Marine Invertebrates in Relation to Temperature Conditions Under Which the Species Exist,
W77-06771 5C

Technical Trawl Survey of the Benthic Epifauna of the Chukchi Sea and Norton Sound.
W77-06848 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

INVESTIGATIONS
Investigation of Precipitation Within Forest Ecosystems, (In Hungarian),
W77-06797 2B

INVESTMENT
A Sector Model for Regional and National Water Resources Planning,
W77-06731 6A

ION EXCHANGE
Quantitative Analysis of Enteroviruses in Water with Various Degrees of Pollution, (In Russian),
W77-07070 5A

IONIZATION
Treatment of Sewage by Electrons and Gammas,
W77-07012 5D

IRON BACTERIA
New Design Gives Denver District Iron-Free Well,
W77-06868 8A

IRRADIATION
Electron-Beam Irradiation of Waste Products--e.g., For Sterilization of Sewage Sludge and Waste Industrial Products.
W77-06997 5D

Treatment of Sewage by Electrons and Gammas,
W77-07012 5D

IRREVERSIBLE EFFECTS
Regulating Activities with Catastrophic Environmental Effects,
W77-06703 6G

IRRIGATION
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

Economic Analysis of Alternative Groundwater Withdrawal Rates in Conjunction with Surface Water Irrigation,
W77-06740 4B

Water in the Palouse River Basin, Washington,
W77-06978 4B

Accumulation of Heavy Metals in Soils from Extended Waste Water Irrigation,
W77-07049 5B

Underflow from Sludge-Irrigated Cropland,
W77-07056 5B

IRRIGATION EFFECTS
The Effect of Different Methods on Growth, Development and Yield of Cotton, (In German),
W77-06962 3F

IRRIGATION PRACTICES
Irrigation of the Nebit-Dag Plantings by Mineralized Ground Water, (In Russian),
W77-06691 3C

IRRIGATION SYSTEMS
The Effect of Different Methods on Growth, Development and Yield of Cotton, (In German),
W77-06962 3F

ISOBORNYL THIOCYANOACETATE
Field Tests of Isobornyl Thiocyanoacetate (Thanite) for Live Collection of Fishes,
W77-06747 5C

ITALY (PADUA)
The Algal Flora in the Thermal Baths of Montegrotto Terme (Padua). Its Distribution Over One-Year Period,
W77-06770 5C

JAMAICA BAY (NY)
Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

JAPAN (MIYAKE-JIMA)
Notes on the Nesting Success and Fecundity of the Anemonefish Amphiprion Clarkii at Miyake-Jima, Japan,
W77-06763 5C

JET PUMPS
It's All on the Nameplate: Everything You Always Wanted to Know About Jet Pumps,
W77-06854 8C

JETS
Method of Treating Waste Water with Jet Nozzles,
W77-07090 5D

JUVENILE FISH
The Growth of Young Salmonids (Onchorhynchus Keta): Controlled Ecosystem Pollution Experiment,
W77-06618 5A

KANSAS
Land Forming Systems to Improve Water Use Efficiency,
W77-06761 3F

Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

KAOLINITE
Bonding of Calcium and Potassium by Vermiculite and Kaolinite Clays as Affected by H-Clay Addition,
W77-06872 2G

KATHAROBIC WATERS
Distribution and Indicatory Value of the Submerged Macrophytes in the Flowing Waters of the Friedberger Au, (In German),
W77-06802 5C

KENTUCKY
Debris Basins for Control of Surface Mine Sedimentation,
W77-06672 5G

KENYA (RIFT VALLEY)
Hydrochemistry of the Lake Magadi Basin, Kenya,
W77-06967 2K

KEYSTONE RESERVOIR (OK)
A New Reservoir and Recreational Behavior,
W77-06956 6B

KINETICS
The Effect of High Purity Oxygen on the Activated Sludge Process,
W77-07043 5D

Phosphates in Soils Treated with Sewage Water: III. Kinetic Studies on the Reaction of Phosphates with Aluminum Compounds,
W77-07054 5B

LIBRARY U. OF I. URBANA-CHAMPAIGN

KODIAK ISLAND (ALAS)
Assessment of Pelagic and Nearshore Fish in Three Bays on Southeast Kodiak Island,
W77-06846 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

KOOTENAI RIVER (MONT)
A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

KOTZEBUE SOUND (ALAS)
Avian Community Ecology at Two Sites on Espenberg Peninsula in Kotzebue Sound, Alaska. A Composite Study of: (1) Habitat Utilization and Breeding Ecology of Waterbirds, (2) Habitat Utilization and Breeding Ecology of Shorebirds and Nonwaterbird Species, and (3) Habitat Utilization, Breeding Ecology, and Feeding Ecology of Predators of Birds,
W77-06820 6G

LABORATORY TESTS
Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

A Biological Monitoring System Employing Rheotaxis of Fish,
W77-06609 5C

Tissue Accumulation and Enzymatic Effects of Hexavalent Chromium in Rainbow Trout (Salmo Gairdneri),
W77-06639 5C

Laboratory Study of the Flexural Strength and Elastic Modulus of Freshwater and Saline Ice,
W77-06661 2C

Some Effects on Integral Photosynthesis of Artificial Circulation of Phytoplankton Through Light Gradients,
W77-06696 5C

Toxicity of Rotenone to Fish in Standardized Laboratory Tests,
W77-06748 5C

Reproductive Cycle of Trout and Tench: Effect of Experimental Variations of the Temperature, (Etude Sur le Cycle Reproducteur do la Truite Arc-En-Ciel et de la Tanche: Effet de Variations Experimentales de la Temperature),
W77-06779 5C

Laboratory Studies on the Effect of Metals on Oxygen Uptake by Sewage Sludge in Brackish Water,
W77-06788 5C

Egg Incubation and Larval Rearing of Navaga (Eleginus Navaga Pall.), Polar Cod (Boreogadus Saida Lepechin) and Arctic Flounder (Liopsetta Glacialis Pall.) in the Laboratory,
W77-06792 8I

LAKE BIKCZE (POLAND)
Dynamics of Phytoplankton Biomass in Two Lakes of Different Limnological Character,
W77-06685 5C

The Share of Algae with Different Dimensions in the Plankton of Two Lakes of Different Trophic Character in the Annual Cycle,
W77-06692 5C

LAKE CARL BLACKWELL (OKLA)
Measurements of Planktonic Biomass in a Reservoir,
W77-06679 5A

LAKE CIRCULATION
The Observed Winter Circulation of Lake Ontario,
W77-06655 2H

LAKE GEORGE (NEW YORK)
Nutrient Removal and Sludge Disposal Within Septic Systems-Phase III,
W77-06686 5D

LAKE GEORGE (NY)
Means for Protecting the Drinking Water Quality of Lake George, New York,
W77-06682 5G

A General Model of Microbial Growth and Decomposition in Aquatic Ecosystems,
W77-06684 5C

LAKE HURON
Application of Landsat to the Surveillance and Control of Eutrophication in Saginaw Bay,
W77-06665 5A

LAKE IN THE CLOUDS (MINN)
Iron-Rich Rhythmically Laminated Sediments in Lake of the Clouds, Northeastern Minnesota,
W77-06901 2J

LAKE MAGADI BASIN (KENYA)
Hydrochemistry of the Lake Magadi Basin, Kenya,
W77-06967 2K

LAKE MICHIGAN
Coastal Meteorological Networks to Determine Effects of Nuclear Plant Cooling Systems,
W77-06643 2B

Lake Currents and Temperatures Near the Western Shore of Lake Michigan,
W77-06687 2H

LAKE MONROE (IND)
Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

LAKE ONTARIO
The Observed Winter Circulation of Lake Ontario,
W77-06655 2H

Lake Ontario Atlas: Surface Waves,
W77-06884 2H

LAKE PIASECZNO (POLAND)
Dynamics of Phytoplankton Biomass in Two Lakes of Different Limnological Character,
W77-06685 5C

The Share of Algae with Different Dimensions in the Plankton of Two Lakes of Different Trophic Character in the Annual Cycle,
W77-06692 5C

LAKE RESTORATION
Lake Restoration by Bottom Water Siphoning (In German),
W77-06689 5G

LAKE SEDIMENTS
Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

LAKE ST. CLAIR
Lake St. Clair Hydrologic Transfer Factors.
W77-06879 2H

LAKE TJEUKEMEER (NETHERLANDS)
A Study on the Role of Herbivorous Zooplankton Community as Primary Consumers of Phytoplankton in Dutch Lakes,
W77-06695 5C

LAKE VECHTEN (NETHERLANDS)
A Study on the Role of Herbivorous Zooplankton Community as Primary Consumers of Phytoplankton in Dutch Lakes,
W77-06695 5C

LAKES
Mixing in Upper Layer of a Lake During Heating Cycle,
W77-06649 2H

Means for Protecting the Drinking Water Quality of Lake George, New York,
W77-06682 5G

The Share of Algae with Different Dimensions in the Plankton of Two Lakes of Different Trophic Character in the Annual Cycle,
W77-06692 5C

Ecological Relations Between Invertebrates and Submerged Macrophytes in the Lake Littoral,
W77-06694 5C

A Study on the Role of Herbivorous Zooplankton Community as Primary Consumers of Phytoplankton in Dutch Lakes,
W77-06695 5C

Optimal Complex Use of Controlled Water Resources of a Basin,
W77-06718 4A

Lake St. Clair Hydrologic Transfer Factors.
W77-06879 2H

Lake Ontario Atlas: Surface Waves,
W77-06884 2H

Iron-Rich Rhythmically Laminated Sediments in Lake of the Clouds, Northeastern Minnesota,
W77-06901 2J

Numerical Models of Wind-Driven Circulation in Lakes,
W77-06958 2H

Hydrochemistry of the Lake Magadi Basin, Kenya,
W77-06967 2K

Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

LAMINATED SEDIMENTS
Iron-Rich Rhythmically Laminated Sediments in Lake of the Clouds, Northeastern Minnesota,
W77-06901 2J

LAND DEVELOPMENT
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

LAND FORMING
Land Forming Systems to Improve Water Use Efficiency,
W77-06761 3F

LAND MANAGEMENT
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

Diminution Ratios for Planning Construction-Area Sediment Controls,
W77-06980 4D

LAND RESOURCES
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

LAND USE
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

Design Study of Environmental and Human Cultural Information System Needs in Urban Water Resource Development,
W77-06634 6B

Computer Mapping of Landsat Data for Environmental Applications,
W77-06666 5A

A Study of the Utilization of EREP Data from the Wabash River Basin,
W77-06670 7B

Open Space and Urban Water Management - Phase II: Case Studies and Findings,
W77-06917 6B

Flood Management Study.
W77-06952 6F

LANDFILLS
Study of Leachate at Landfill Sites 1975, Volume 1.
W77-06851 5B

What's New in Landfill Liners.
W77-07051 5G

LANDSAT
Application of Landsat to the Surveillance and Control of Eutrophication in Saginaw Bay,
W77-06665 5A

Computer Mapping of Landsat Data for Environmental Applications,
W77-06666 5A

A Study of the Utilization of EREP Data from the Wabash River Basin,
W77-06670 7B

LARVAE
Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

Ichthyoplankton of the Eastern Bering Sea,
W77-06845 6G

LARVAL GROWTH STAGE
Egg Incubation and Larval Rearing of Navaga (Eleginus Navaga Pall.), Polar Cod (Boreogadus Saida Lepechin) and Arctic Flounder (Liopsetta Glacialis Pall.) in the Laboratory,
W77-06792 8I

LAURENTIAN CHANNEL
Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

LEACHATE MIGRATION
Study of Leachate at Landfill Sites 1975, Volume 1.
W77-06851 5B

LEACHATES
Characterization of Soluble Organic Matter in Leachate,
W77-07039 5A

LEAD
The Uptake of Lead, Zinc, Cadmium, and Copper by the Pulmonate Mollusc, Helix aspersa Muller, and its Relevance to the Monitoring of Heavy Metal Contamination of the Environment,
W77-06629 5C

The Toxic Effects of Selected Heavy Metals on Unadapted Populations of Vorticella Convallaria Var Similis,
W77-06636 5C

Long-Term Lead Accumulation in Abalone (Haliotis Spp.) Fed on Lead-Treated Brown Algae (Egregia Laevigata),
W77-06776 5C

Correlation Coefficients and Concentration Factors of Copper and Lead in Seawater and Benthic Algae,
W77-06783 5C

LEAF MESOPHYLL
Dependence of Water Absorption by the Cell Walls of Plant Leaves on the Volume of the Free Space, (In Russian),
W77-06827 2I

LEAKAGE
Tables and Type Curves for Analysis of Pump Tests in Leaky Parallel-Channel Aquifers,
W77-06941 4B

Testing and Grouting Leaking Joints,
W77-06986 8G

LEAKY AQUIFERS
Tables and Type Curves for Analysis of Pump Tests in Leaky Parallel-Channel Aquifers,
W77-06941 4B

LEGISLATION
Environmental Impact Statements in Water Resources Planning and Decision Making,
W77-06738 6E

LEPOMIS SSP
Field Tests of Isobornyl Thiocyanoacetate (Thanite) for Live Collection of Fishes,
W77-06747 5C

LETHAL LIMIT
Toxicity of Fluoride to Brown Trout Fry (Salmo trutta),
W77-06628 5C

LIFE SPAN
Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

LIGHT
Process for the Treatment of Waste Water by Heterogeneous Photosensitized Oxidation,
W77-07006 5D

LIGHT PENETRATION
Temperature, Salinity and Light Penetration Structures: Controlled Ecosystem Pollution Experiment,
W77-06626 5A

Some Effects on Integral Photosynthesis of Artificial Circulation of Phytoplankton Through Light Gradients,
W77-06696 5C

LINEAR ALKYLATE SULFONATES
LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

LINEAR PROGRAMMING
Integration of Aquifers in Flood Control Projects,
W77-06723 4A

LININGS
The Fabric-Lined Purification Basin.
W77-07035 5D

What's New in Landfill Liners.
W77-07051 5G

LIQUID WASTES
Process for the Treatment of Waste Water by Heterogeneous Photosensitized Oxidation,
W77-07006 5D

Underflow from Sludge-Irrigated Cropland,
W77-07056 5B

Application of Municipal Refuse and Liquid Sewage Sludge to Agricultural Land: II. Lysimeter Study,
W77-07080 5D

LITERATURE REVIEWS
Literature Review of Wastewater Characteristics and Abatement Technology in the Wood and Timber Processing Industry.
W77-06951 5D

LITTORAL
Ecological Relations Between Invertebrates and Submerged Macrophytes in the Lake Littoral,
W77-06694 5C

LITTORAL DRIFT
Littoral Drift Estimates Along the Coastline of Florida,
W77-06882 2L

LOCK EWE (SCOTLAND)
Loch Ewe Bag Experiment, 1974,
W77-06627 5A

LONG ISLAND SOUND
Interstitial Water Chemistry of Anoxic Long Island Sound Sediments. 1. Dissolved Gases,
W77-06900 5B

LONG-TERM PLANNING
Optimal Planning of Flows in Multi-Reservoir Hydro-Power Systems,
W77-06730 4A

A Sector Model for Regional and National Water Resources Planning,
W77-06731 6A

LOUISIANA
Floods in Louisiana, Magnitude and Frequency, Third Edition,
W77-06979 2E

LIBRARY U. OF I. URBANA-CHAMPAIGN

LOWER SNAKE RIVER
Dissolved Nitrogen, Dissolved Oxygen and Related Water Temperatures in the Columbia and Lower Snake Rivers, 1965-1969,
W77-06925 5C

LURGI PROCESS
Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

LYSIMETERS
Application of Municipal Refuse and Liquid Sewage Sludge to Agricultural Land: II. Lysimeter Study,
W77-07080 5D

MACROBRACHIUM ROSENBERGII
Algal Supplement Enhancement of Static and Recirculating System,
W77-06933 5C

MACROPHYTES
Ecological Relations Between Invertebrates and Submerged Macrophytes in the Lake Littoral,
W77-06694 5C

MACROPHYTES (SUBMERGED)
Distribution and Indicatory Value of the Submerged Macrophytes in the Flowing Waters of the Friedberger Au, (In German),
W77-06802 5C

MADDEN LAKE (PANAMA CANAL ZONE)
Stratification of Kinetic Origin and its Biological Consequences in a Neotropical Man-Made Lake,
W77-06683 2H

MAINE
The Historic and Present Relationships Between Phytoplankton, Limiting Nutrients, and Sediment-Water Geochemical Processes in Selected Maine Lakes,
W77-06741 5C

Use of Remote Sensing to Quantify Construction Material and to Define Geologic Lineations; Dickey-Lincoln School Lakes Project, Maine,
W77-06888 8D

MAINTENANCE
Cincinnati's Preventive Maintenance Sewer Program.
W77-06989 5G

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

Contract Services Stretch Sewer Maintenance Budget,
W77-06994 8G

MALACHITE GREEN
Effect of Malachite Green and Formalin on the Survival of Largemouth Bass Eggs and Fry,
W77-06612 5C

Changes in the Blood Chemistry of Coho Salmon Exposed to Malachite Green,
W77-06746 5C

MALHEUR RIVER DRAINAGE BASIN (OR)
Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

MAMMALS
Baseline Characterization of Marine Mammals in the Bering Sea,
W77-06794 6G

Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

The Natural History and Ecology of the Bearded Seal (Erignathus Barbatus) and the Ringed Seal (Phoca (Pusa) Hispida),
W77-06799 6G

MANAGEMENT
Design Study of Environmental and Human Cultural Information System Needs in Urban Water Resource Development,
W77-06634 6B

La Science des Systemes dans la Planification des Ressources en Eau,
W77-06736 6A

Improvement of Planning for Post-Development Water Resource Management: A Study of the Weber Basin Project,
W77-06739 6B

Open Space and Urban Water Management - Phase II: Case Studies and Findings,
W77-06917 6B

Coastal Zone Management, Annotated Bibliography,
W77-06937 2L

MAPPING
Application of Landsat to the Surveillance and Control of Eutrophication in Saginaw Bay,
W77-06665 5A

Computer Mapping of Landsat Data for Environmental Applications,
W77-06666 5A

River Basin Snow Mapping at the National Environmental Satellite Service,
W77-06915 2C

MARINE ANIMALS
Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

MARINE BACTERIA
Response of Natural Marine Bacterial Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06622 5A

Effects of Four Oils on Marine Bacterial Populations: Controlled Ecosystem Pollution Experiment,
W77-06623 5A

MARINE BIOLOGY
Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

MARINE ECOSYSTEMS
Stable Elements of Radioecological Importance in Certain Echinoderm Species,
W77-06640 5A

MARINE ENVIRONMENTS
Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

MARINE FUNGI
Effect of Salinity on Spore Germination of Terrestrial and Marine Fungi,
W77-06772 5C

MARINE MICROORGANISMS
Temperature, Salinity and Light Penetration Structures: Controlled Ecosystem Pollution Experiment,
W77-06626 5A

MARKOV PROCESSES
Optimal Complex Use of Controlled Water Resources of a Basin,
W77-06718 4A

MARYLAND
An Executive Summary of Three EPA Demonstration Programs in Erosion and Sediment Control,
W77-06671 5G

Measurement in a Marine Environment Using Low Cost Sensors of Temperature and Dissolved Oxygen,
W77-06960 7B

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

MASSACHUSETTS
A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5C

New Programs Improve Sensitive Areas of Water and Sewer Systems,
W77-06995 8G

MASSACHUSETTS BAY
A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

MATHEMATICAL MODELS
An Approximating Polynomial for the Computation of Saturation Vapor Pressure,
W77-06652 2D

The Distribution of Natural and Anthropogenic Elements and Compounds in Precipitation Across the U.S.; Theory and Quantitative Models,
W77-06675 2

A General Model of Microbial Growth and Decomposition in Aquatic Ecosystems,
W77-06684 5

Mathematical Models in Hydrology.
W77-06708 2

Mathematical Model of Water Resource Utilization in a River Basin,
W77-06719 4

Construction and Adjustment of a Two-Layer Mathematical Model of the Llobregat Delta,
W77-06722 4

Further Development and Testing of a Stream Aquifer System Model,
W77-06762 2

A Model for the Water Regime of a Deciduous Forest with Special Consideration of the Functional Interrelationships Among Meteorologic

Factors, Soil Water Content and Evapotranspiration, (In German),
W77-06864 2A

A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

Numerical Models of Wind-Driven Circulation in Lakes,
W77-06958 2H

Comparison of Iterative Methods of Solving Two-Dimensional Groundwater Flow Equations,
W77-06965 2F

IATHEMATICAL SMOOTHING
Smoothing Data with Cubic Splines,
W77-06831 7C

IATHEMATICAL STUDIES
Smoothing Data with Cubic Splines,
W77-06831 7C

EASUREMENT
Measurements of Planktonic Biomass in a Reservoir,
W77-06679 5A

A Universal Calibration Equation for Price Meters and Similar Instruments,
W77-06943 7B

Measurement in a Marine Environment Using Low Cost Sensors of Temperature and Dissolved Oxygen,
W77-06960 7B

EDITERRANEAN COAST (ISRAEL)
Heavy Metal Concentrations in Water, Sediments, and Fish from Mediterranean Coastal Area, Israel,
W77-06782 5C

EDITERRANEAN SEA
Nile Cone: Late Quaternary Stratigraphy and Sediment Dispersal,
W77-06650 2L

Effect of the Nile Flood on the Estuarine and Coastal Circulation Pattern Along the Mediterranean Egyptian Coast,
W77-06907 2L

EDWAY ESTUARY (ENG)
Heavy Metals in Macroinvertebrates and Fish From the Lower Medway Estuary, Kent,
W77-06790 5C

EMBRANE PROCESSES
LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

ENHADEN
Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

ERCURY
The Accumulation of Organic Mercury from Sea Water by the Plaice, Pleuronectes platessa ...,
W77-06607 5C

Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

The Toxic Effects of Selected Heavy Metals on Unadapted Populations of Vorticella Convallaria Var Similis,
W77-06636 5C

A Preliminary Survey of Mercury in Fish from Bombay and Thana Environment,
W77-06785 5C

METABOLISM
Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

Effect of Two Rearing Conditions on Growth and Body Composition in Carp (Cyprinus Carpio L), (Influence de Deux Modes d'Elevage sur la Croissance et la Composition Corporelle de la Carpe Commune),
W77-06769 5C

Gas Bubble Disease of Salmonids: A Critical Review,
W77-06920 5

METAL FINISHING INDUSTRY
Proceedings Technology Transfer Seminar on Waste Handling, Disposal and Recovery in the Metal Finishing Industry, November 12-13, 1975, Toronto, Ontario.
W77-06950 5D

METALS
The Accumulation of Organic Mercury from Sea Water by the Plaice, Pleuronectes platessa L.,
W77-06607 5C

The Toxic Effects of Selected Heavy Metals on Unadapted Populations of Vorticella Convallaria Var Similis,
W77-06636 5C

Partial Extraction of Metals from Aquatic Sediments,
W77-06781 5A

Laboratory Studies on the Effect of Metals on Oxygen Uptake by Sewage Sludge in Brackish Water,
W77-06788 5C

Proceedings Technology Transfer Seminar on Waste Handling, Disposal and Recovery in the Metal Finishing Industry, November 12-13, 1975, Toronto, Ontario.
W77-06950 5D

METEOROLOGICAL DATA
Simple Formulae for the Estimation of Wet Bulb Temperature and Precipitable Water,
W77-06646 2B

Pelagic and Demersal Fish Assessment in the Lower Cook Inlet Estuary System,
W77-06829 6G

A Test Particle Dispersion Study in Massachusetts Bay.
W77-06880 2L

METHANE
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

Interstitial Water Chemistry of Anoxic Long Island Sound Sediments. 1. Dissolved Gases,
W77-06900 5B

Fuel Gas and Electricity from Municipal Sewage,
W77-07065 5D

METHANE BACTERIA
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

METHANE CONTENT
Interstitial Water Chemistry of Anoxic Long Island Sound Sediments. 1. Dissolved Gases,
W77-06900 5B

METHANE FORMATION
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

METHANE OXIDIZING BACTERIA
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

METHANE PRODUCERS
Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

METHODOLOGY
Rotary-Flow Technique for Testing Fitness of Fish,
W77-06608 5C

A Biological Monitoring System Employing Rheotaxis of Fish,
W77-06609 5C

An Electronic System to Monitor the Effects of Changes in Water Quality on Fish Opercular Rhythms,
W77-06610 5C

A Pneumatic Grab for Obtaining Large, Undisturbed Mud Samples: Its Construction and Some Applications for Measuring the Growth of Larvae and Emergence of Adult Chironomidae,
W77-06613 5A

Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

Loch Ewe Bag Experiment, 1974,
W77-06627 5A

An Offshore Biomonitoring System for Chlorinated Hydrocarbons,
W77-06641 5A

Climatology for Geographers,
W77-06659 2B

Presenting Trends in Lake Eutrophication,
W77-06693 5C

Mathematical Models in Hydrology.
W77-06708 2A

Simplified Methods of Computing the Quantity of Urban Runoff,
W77-07072 5B

LIBRARY U. OF I. URBANA-CHAMP...

METHOXYCHLOR
The Effects of Methoxychlor on Riffle Invertebrate Populations and Communities,
W77-06614 5C

MIAMI-DADE (FLORIDA) WATER AND SEWER AUTHORITY
Expansion Comes Quickly to AWT Plant,
W77-07009 5D

MICHIGAN
Coastal Meteorological Networks to Determine Effects of Nuclear Plant Cooling Systems,
W77-06643 2B

MICRO-ZOOPLANKTON
Dynamics of Micro-Zooplankton Populations Treated with Copper: Controlled Ecosystem Pollution Experiment,
W77-06616 5A

MICROBIAL DEGRADATION
A General Model of Microbial Growth and Decomposition in Aquatic Ecosystems,
W77-06684 5C

Microbial Methane Consumption Reactions and Their Effect on Methane Distributions in Freshwater and Marine Environments,
W77-06899 5C

MICROORGANISMS
Effects of Four Oils on Marine Bacterial Populations: Controlled Ecosystem Pollution Experiment,
W77-06623 5A

Escherichia Coli as a Sanitary-Indicator Microorganism, (In Russian),
W77-07067 5A

MICROWAVES
Waste Water System Uses Microwaves,
W77-07019 5D

MIGRATORY BIRDS
Identification, Documentation and Delineation of Coastal Migratory Bird Habitat in Alaska,
W77-06804 6G

Avifaunal Utilization of the Offshore Island Area Near Prudhoe Bay, Alaska,
W77-06812 6G

Characterization of Coastal Habitat for Migratory Birds: Northern Bering Sea,
W77-06824 6G

MIKOLAJSKIE LAKE (POLAND)
Ecological Relations Between Invertebrates and Submerged Macrophytes in the Lake Littoral,
W77-06694 5C

MILLET
Dependence of Water Absorption by the Cell Walls of Plant Leaves on the Volume of the Free Space, (In Russian),
W77-06827 2I

MINE WASTES
Experience in Treating Waste Waters from the Donetsk Mines, (In Russion),
W77-07068 5D

MINERAL CONTENT
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

MINERAL EXTRACTION
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

MINERAL QUALITY
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

MINERAL WATER
Mineral Content of Selected Geothermal Waters,
W77-06667 3E

MINERALIZED GROUNDWATER
Irrigation of the Nebit-Dag Plantings by Mineralized Ground Water, (In Russian),
W77-06691 3C

MINERALOGY
Irrigation of the Nebit-Dag Plantings by Mineralized Ground Water, (In Russian),
W77-06691 3C

MINNESOTA
Iron-Rich Rhythmically Laminated Sediments in Lake of the Clouds, Northeastern Minnesota,
W77-06901 2J

A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

Sewerage for a Rural Resort Area,
W77-06987 5D

MISSISSIPPI DELTA
Methane-Derived Carbonate Cements in Barrier and Beach Sands of a Subtropical Delta Complex,
W77-06677 2L

MISSISSIPPI RIVER
Methane-Derived Carbonate Cements in Barrier and Beach Sands of a Subtropical Delta Complex,
W77-06677 2L

MISSISSIPPI SOUND
Mississippi Sound Temporal and Spatial Distribution of Nutrients,
W77-06932 5B

MISSOURI RIVER BASIN
Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

MITOCHONDRIA
Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

MIXING
Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

Mixing in Upper Layer of a Lake During Heating Cycle,
W77-06649 2H

MODE OF ACTION
LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

MODEL STUDIES
The Distribution of Natural and Anthropogenic Elements and Compounds in Precipitation Across the U.S.; Theory and Quantitative Models,
W77-06675 2B

Investigation of the Effects of Nonhomogeneous (or Nonstationary) Behavior on the Spectra of Atmospheric Turbulence,
W77-06678 2B

Adjustment Costs and Optimal Waste Treatment,
W77-06699 5D

Optimal Oil Tanker Size with Regard to Environmental Impact of Oil Spills,
W77-06702 5C

Regulating Activities with Catastrophic Environmental Effects,
W77-06703 6C

Optimal Investment in Pollution Control Capital in a Neoclassical Growth Context,
W77-06705 6C

Observations of Wind-Generated Waves over Variable Current,
W77-06896 2E

Phosphate Prediction Model for Streams by Means of Discriminant Analysis,

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

An Analysis of Inertial Oscillations Observed Near Oregon Coast,
W77-06892 2L

OREGON INLET (NC)

Exchange Through a Barrier Island Inlet: Additional Evidence of Upwelling Off the Northeast Coast of North Carolina,
W77-06654 2L

ORGANIC COMPOUNDS

Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

Hydrocarbon Products Manufacture--By Carbonisation of Coal, Scrap Rubber or Plastic or Domestic Sewage Under Reduced Pressure.
W77-07000 5D

ORGANIC MATTER

The Removal of Organic Matter from Water Supplies by Ion Exchange,
W77-06760 5F

Characterization of Soluble Organic Matter in Leachate,
W77-07039 5A

Advanced Waste Treatment Seminar, Session III, Removal of Solids and Organics, Held at San Francisco, on October 28-29, 1970.
W77-07074 5D

ORGANIC WASTES

Particle Characteristics and Dispersal Patterns of Sugar Cane Wastes in Selected Rivers and Estuaries of Puerto Rico,
W77-06632 5B

ORGANOLEPTIC PROPERTIES

Identity, Origin and Development of Off-Flavors in Great Lakes Anadromous Fish,
W77-06931 5A

OUT-OF-KILTER ALGORITHMS

The Out-of-Kilter Algorithm as a Single-Step Method for Simulation and Optimization of Vistula River Planning Alternatives,
W77-06735 4A

OUTER CONTINENTAL

Reconnaissance Characterization of Littoral Biota, Beaufort and Chukchi Seas,
W77-06843 6G

OUTER CONTINENTAL SHELF

Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 1: Marine Mammals, Marine Birds.
W77-06793 6G

Baseline Characterization of Marine Mammals in the Bering Sea,
W77-06794 6G

Abundance and Seasonal Distribution of Marine Mammals in the Gulf of Alaska,
W77-06795 6G

Distribution and Abundance of Bowhead and Belukha Whales in the Bering and Chukchi Seas,
W77-06796 6G

The Natural History and Ecology of the Bearded Seal (Erignathus Barbatus) and the Ringed Seal (Phoca (Pusa) Hispida),
W77-06799 6G

An Aerial Census of Spotted Seals, Phoca Vitulina Largha,
W77-06800 6G

Identification, Documentation and Delineation of Coastal Migratory Bird Habitat in Alaska,
W77-06804 6G

Identification, Documentation, and Delineation of Coastal Migratory Bird Habitat in Alaska, and the Distribution, Abundance and Feeding Ecology of Birds Associated with Pack Ice,
W77-06805 6G

Ecosystem Dynamics Birds and Marine Mammals. Part I: Preliminary Estimates of Pinniped - Finfish Relationships in the Bering Sea,
W77-06806 6G

Ecosystem Dynamics Birds and Marine Mammals. Part II: Food Web Structure and Trophic Relations of Bering Sea Avifauna (Preliminary Report),
W77-06807 6G

Ecosystem Dynamics Birds and Marine Mammals. Part III: A Dynamic Numerical Marine Ecosystem Model for Evaluation of Marine Resources in Eastern Bering Sea,
W77-06808 6G

Reproductive Ecology of Pribilof Island Seabirds,
W77-06809 6G

Community Structure, Distribution, and Interrelationships of Marine Birds in the Gulf of Alaska,
W77-06810 6G

Shorebird Dependence on Arctic Littoral Habitats,
W77-06811 6G

Avifaunal Utilization of the Offshore Island Area Near Prudhoe Bay, Alaska,
W77-06812 6G

Birds of Coastal Habitat on the South Shore of Seward Peninsula, Alaska,
W77-06813 6G

Ecology and Behavior of Southern Hemisphere Shearwaters (Genus Puffinus) and Other Seabirds, When Over the Outer Continental Shelf of the Bering Sea and Gulf of Alaska During the Northern Summer,
W77-06814 6G

Seasonal Distribution and Abundance of Marine Birds,
W77-06815 6G

Preliminary Catalog of Seabird Colonies and Photographic Mapping of Seabird Colonies,
W77-06816 6G

Review and Analysis of Literature and Unpublished Data on Marine Birds,
W77-06817 6G

Migration of Birds in Alaska Coastal and Marine Habitats Subject to Influence by OCS Development,
W77-06818 6G

Feeding Ecology and Trophic Relationships of Alaskan Marine Bird, and Population Dynamics of Marine Birds,
W77-06819 6G

Avian Community Ecology at Two Sites on Espenberg Peninsula in Kotzebue Sound, Alaska. A Composite Study of: (1) Habitat Utilization and Breeding Ecology of Waterbirds, (2) Habitat Utilization and Breeding Ecology of Shorebirds and Nonwaterbird Species, and (3) Habitat Utilization, Breeding Ecology, and Feeding Ecology of Predators of Birds,
W77-06820 6G

Studies of Populations, Community Structure and Colony of Marine Birds at King Island, Bering Strait Region, Alaska,
W77-06821 6G

Avian Community Ecology of the Akulik - Inglutalik River Delta, Norton Bay, Alaska,
W77-06822 6G

A Comparative Sea-Cliff Bird Inventory of the Cape Thompson Vicinity, Alaska,
W77-06823 6G

Characterization of Coastal Habitat for Migratory Birds: Northern Bering Sea,
W77-06824 6G

Environmental Assessment of the Alaskan Continental Shelf. Principal Investigators' Reports July-September 1976. Volume 2: Fish, Plankton, Benthos, Littoral.
W77-06825 6G

The Distribution, Abundance, Diversity and Productivity of Benthic Organisms in the Bering Sea,
W77-06826 6G

Spawning Herring Surveys in the Bering Sea and Finfish Resource Surveys in Norton Sound and Kotzebue Sound,
W77-06828 6G

Pelagic and Demersal Fish Assessment in the Lower Cook Inlet Estuary System,
W77-06829 6G

Razor Clam (Siliqua Patula, Dixon) Distribution and Population Assessment Study,
W77-06830 6G

Resources of Non-Salmonid Pelagic Fish of the Eastern Bering Sea and the Gulf of Alaska,
W77-06832 6G

Baseline/Reconnaissance Characterization, Littoral Biota, Gulf of Alaska and Bering Sea,
W77-06833 6G

Plankton of the Gulf of Alaska - Ichthyoplankton,
W77-06834 6G

Initial Zooplankton Investigations in Lower Cook Inlet,
W77-06835 6G

Phytoplankton and Primary Productivity in the Northeast Gulf of Alaska,
W77-06836 6G

Baseline Studies of Fish and Shellfish Resources of Norton Sound and the Southeastern Chukchi Sea,
W77-06839 6G

Beaufort Sea Estuarine Fishery Study,
W77-06840 6G

The Distribution, Abundance, Diversity, and Productivity of Benthic Organisms in the Gulf of Alaska,
W77-06841 6G

Food and Feeding Relationships in the Benthic and Demersal Fishes of the Gulf of Alaska and Bering Sea,
W77-06842 6G

Ichthyoplankton of the Eastern Bering Sea,
W77-06845 6G

Assessment of Pelagic and Nearshore Fish in Three Bays on Southeast Kodiak Island,
W77-06846 6G

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

Technical Trawl Survey of the Benthic Epifauna of the Chukchi Sea and Norton Sound.
W77-06848 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

A Comprehensive Plan for the Global Investigation of Pollution in the Marine Environment and Baseline Study Guidelines.
W77-06850 5A

Program Development Plan. Environmental Assessment of the Alaskan Continental Shelf,
W77-06878 6G

State Information Needs Related to Onshore and Nearshore Effects of OCS Petroleum Development,
W77-06934 6G

OVERFLOW

Chicago Drives Large Bores to Control Combined Sewage Flow.
W77-06988 8E

Single P/C Unit Removal of Nutrients from Combined Sewer Overflows,
W77-07031 5D

Treatment of Combined Sewer Overflows Via Thin Film Chemistry,
W77-07034 5D

OWYHEE DRAINAGE BASIN (OR)

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

OXIDATION

Oxidation and Ozonation Chamber,
W77-06999 5D

Waste Treatment Apparatus,
W77-07005 5D

Process for the Treatment of Waste Water by Heterogeneous Photosensitized Oxidation,
W77-07006 5D

Method of Applying Ozone and Sonic Energy to Sterilize and Oxidize Waste Water,
W77-07007 5D

Waste Treatment Process,
W77-07091 5D

Ozone Oxidation of Waste Water,
W77-07094 5D

OXIDATION LAGOONS

Stabilisation Lagoons Including Experience in Brazil. Part 1,
W77-07063 5D

OXYGEN

The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

The Effect of High Purity Oxygen on the Activated Sludge Process,
W77-07043 5D

OXYGEN DEMAND

The Electrolytic Respirometer-II. Use in Water Pollution Control Plant Laboratories,
W77-07081 5D

OXYGEN MINIMUM LAYER

Effects of Pressure, Temperature and Oxygen on the Oxygen-Consumption Rate of the Midwater Copepod Gaussia Princeps,
W77-06642 5C

OXYGEN REQUIREMENTS

Effects of Pressure, Temperature and Oxygen on the Oxygen-Consumption Rate of the Midwater Copepod Gaussia Princeps,
W77-06642 5C

Fish Diseases and Parasites in Relation to the Environment,
W77-06744 5C

The Electrolytic Respirometer-II. Use in Water Pollution Control Plant Laboratories,
W77-07081 5D

OXYGEN SOLUBILITIES

The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

OXYGEN STRATIFICATION

Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

OXYGENATION

The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

Plug-In Concept for Pilot Sewage Treatment Plant,
W77-07026 5D

Design Criteria for Waste Water Aerator Drives,
W77-07060 5D

OYSTERS

Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

OZONATION

Oxidation and Ozonation Chamber,
W77-06999 5D

OZONE

Oxidation and Ozonation Chamber,
W77-06999 5D

Method of Applying Ozone and Sonic Energy to Sterilize and Oxidize Waste Water,
W77-07007 5D

OZONE MATTER

Ozone Oxidation of Waste Water,
W77-07094 5D

PACIFIC OCEAN

An Analysis of Inertial Oscillations Observed Near Oregon Coast,
W77-06892 2L

Particulate Transport of Radionuclides 14C and 55Fe to Deep Waters in the Pacific Ocean,
W77-06902 5B

PACK ICE

Identification, Documentation, and Delineation of Coastal Migratory Bird Habitat in Alaska, and the Distribution, Abundance and Feeding Ecology of Birds Associated with Pack Ice,
W77-06805 6G

PALOUSE RIVER BASIN (WASH)

Water in the Palouse River Basin, Washington,
W77-06978 4B

LIBRARY U. OF I. URBANA-CHAMPAIGN

PARALLEL-CHANNEL AQUIFERS
Tables and Type Curves for Analysis of Pump Tests in Leaky Parallel-Channel Aquifers,
W77-06941 4B

PARAMETRIC HYDROLOGY
On the Application of Optimization Techniques to Conceptual Catchment Models,
W77-06709 2A

Use of a Parametric Model as a Tool for Hydrometric Network Planning,
W77-06710 2A

PARASITISM
The Mining Fauna in Four Macrophyte Species in Mikolajskie Lake,
W77-06688 5C

PARTICLE SIZE
Factors Influencing the Dewatering Characteristics of Sludge,
W77-07097 5D

PARTICULATE PETROLEUM RESIDUES
High Seas Oil Pollution: Particulate Petroleum Residues in the North Atlantic,
W77-06911 5B

PATENTS
Electron-Beam Irradiation of Waste Products--e.g., For Sterilization of Sewage Sludge and Waste Industrial Products.
W77-06997 5D

Sludge Separator.
W77-06998 5D

Oxidation and Ozonation Chamber,
W77-06999 5D

Hydrocarbon Products Manufacture--By Carbonisation of Coal, Scrap Rubber or Plastic or Domestic Sewage Under Reduced Pressure.
W77-07000 5D

Sewage Aeration Impeller-With Automatic De-Icing and Anti-Clogging System,
W77-07001 5D

Apparatus for Disposal of Effluents.
W77-07002 5E

Method of Waste Treatment and Algae Recovery,
W77-07003 5D

Renovation of Waste Water,
W77-07004 5D

Waste Treatment Apparatus,
W77-07005 5D

Process for the Treatment of Waste Water by Heterogeneous Photosensitized Oxidation,
W77-07006 5D

Method of Applying Ozone and Sonic Energy to Sterilize and Oxidize Waste Water,
W77-07007 5D

Apparatus and Process for Removing Ammonia Nitrogen from Waste Water,
W77-07008 5D

Device for Sucking the Upper Layer of a Polluted Water Surface,
W77-07089 5G

Method of Treating Waste Water with Jet Nozzles,
W77-07090 5D

Waste Treatment Process,
W77-07091 5D

Clarifier with Overflow Scum Removal,
W77-07092 5D

Process for the Purification of Waste Waters with Activated Carbon,
W77-07093 5D

Ozone Oxidation of Waste Water,
W77-07094 5D

PATH OF POLLUTANTS
Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

Effects of Copper on the Dominance and the Diversity of Algae: Controlled Ecosystem Pollution Experiment,
W77-06625 5A

Stable Elements of Radioecological Importance in Certain Echinoderm Species,
W77-06640 5A

Lake Currents and Temperatures Near the Western Shore of Lake Michigan,
W77-06687 2H

Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

Study of Leachate at Landfill Sites 1975, Volume 1.
W77-06851 5B

Particulate Transport of Radionuclides 14C and 55Fe to Deep Waters in the Pacific Ocean,
W77-06902 5B

Phosphate Prediction Model for Streams by Means of Discriminant Analysis,
W77-06906 5B

Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

Dispersion of Liquid Waste from a Moving Barge,
W77-06913 5B

Mississippi Sound Temporal and Spatial Distribution of Nutrients,
W77-06932 5B

Geology and Ground Water in Door County, Wisconsin, with Emphasis on Contamination Potential in the Silurian Dolomite,
W77-06975 5B

Application of Digital Modelling to the Prediction of Radioisotope Migration in Groundwater,
W77-06981 5B

PATHOGENIC FUNGI
Fish Diseases and Parasites in Relation to the Environment,
W77-06744 5C

PATHOLOGY
Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

PELAGIC ECOSYSTEMS
Temperature, Salinity and Light Penetration Structures: Controlled Ecosystem Pollution Experiment,
W77-06626 5A

PENNSYLVANIA
Evaluation of the Environmental Impact to Appalachian Pennsylvania Waters of the 1972 Flood and Subsequent Stream Channelization with Future Policy Recommendations.
W77-06676 4A

Flood Management Study.
W77-06952 6F

Sediment Discharge from an Area of Highway Construction, Applemans Run Basin, Columbia County, Pennsylvania,
W77-06969 4C

Time-Distribution of Storm Rainfall in Pennsylvania,
W77-07022 2B

PERMAFROST
Suprapermafrost Water,
W77-06630 2C

PERMEABILITY
Antierosion Role of Forest Plantings in the Steppe Zone of the Moldavian SSR, (In Russian),
W77-06745 4C

PERSONNEL
The Operations Section of Lincoln Sewage Division,
W77-07023 5D

PESTICIDES
The Effects of Methoxychlor on Riffle Invertebrate Populations and Communities,
W77-06614 5C

Toxicity of Rotenone to Fish in Standardized Laboratory Tests,
W77-06748 5C

Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

PETROCHEMICAL WASTES
Hygienic Effectiveness of Measures for Decontaminating Effluents at Petrochemical Plants, (In Russian),
W77-07069 5D

PETROLEUM HYDROCARBONS
Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

A Pilot Study on the Design of a Petroleum Hydrocarbon Baseline Investigation for Northern Puget Sound and Strait of Juan de Fuca,
W77-06875 5C

PHAEOPHYTA
Long-Term Lead Accumulation in Abalone (Haliotis Spp.) Fed on Lead-Treated Brown Algae (Egregia Laevigata),
W77-06776 5C

PHENOLS
Concentration and Determination of Trace Organic Pollutants in Water,
W77-07098 5A

PHOENIX (AZ)
Flood Hazard Information: Cave Creek, Arizona Canal to 19th Avenue, Phoenix, Arizona.
W77-06954 4A

PHOSPHATE
Phosphates in Soils Treated with Sewage Water: III. Kinetic Studies on the Reaction of Phosphates with Aluminum Compounds,
W77-07054 5B

PHOSPHATE REMOVAL
Recycling of Aluminum Used for Phosphate Removal in Domestic Waste Water Treatment,
W77-07099 5D

PHOSPHATES
Phosphate Prediction Model for Streams by Means of Discriminant Analysis,
W77-06906 5B

Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

Phosphates in Soils Treated with Sewage Water: I. General Information on Sewage Farm, Soil, and Treatment Results,
W77-07052 5G

Phosphates in Soils Treated with Sewage Water: II. Fractionation of Accumulated Phosphates,
W77-07053 5B

Recycling of Aluminum Used for Phosphate Removal in Domestic Waste Water Treatment,
W77-07099 5D

PHOSPHORUS
Automated Method for the Determination of the Phosphorus Content of Detergents,
W77-06944 5A

Influence of Phosphorus Removal on Solids Budget,
W77-07032 5D

Process Technological Background Regarding New Protective Regulations of Water Bodies-Results of Nitrification and Phosphorus Elimination Experiments in Zurich and Bern. III. Filtration by Flocculation for the Elimination of Phosphorus from Communal Waste Water (Verfahrenstechnische Unterlagen im Hinblick auf die neuen Gewaesserschutzanforderungen-Ergebnisse der Versuche ueber die Nitrifikation und Phosphorelimination in Zuerich und Bern. III. Flockungsfiltration zur Elimination von Phosphor aus Kommunalem Abwasser),
W77-07082 5D

Recycling of Aluminum Used for Phosphate Removal in Domestic Waste Water Treatment,
W77-07099 5D

PHOSPHORUS COMPOUNDS
Fate of Nitrogen and Phosphorus in Soils Under Septic Tank Waste Disposal Fields,
W77-06914 5B

PHOTOGRAMMETRY
Improving Estimates of Streamflow Characteristics Using LANDSAT-1 (ERTS-1) Imagery,
W77-06972 4A

PHOTOLYSIS
Process for the Treatment of Waste Water by Heterogeneous Photosensitized Oxidation,
W77-07006 5D

PHOTOMETRY
The Use of Remote Sensing to Detect How Wind Influences Planktonic Blue-Green Algal Distribution,
W77-06697 5C

PHOTOSYNTHESIS
Some Effects on Integral Photosynthesis of Artificial Circulation of Phytoplankton Through Light Gradients,
W77-06696 5C

PHYTOPLANKTON
Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

Response of Natural Marine Bacterial Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06622 5A

Effects of Copper on the Dominance and the Diversity of Algae: Controlled Ecosystem Pollution Experiment,
W77-06625 5A

Chlorine Reactions with Seawater Constituents and the Inhibition of Photosynthesis of Natural Marine Phytoplankton,
W77-06637 5C

Limnological and Planktonic Studies in the Waterton Lakes, Alberta,
W77-06680 5C

Dynamics of Phytoplankton Biomass in Two Lakes of Different Limnological Character,
W77-06685 5C

The Share of Algae with Different Dimensions in the Plankton of Two Lakes of Different Trophic Character in the Annual Cycle,
W77-06692 5C

A Study on the Role of Herbivorous Zooplankton Community as Primary Consumers of Phytoplankton in Dutch Lakes,
W77-06695 5C

Long-Term Changes of the Pelagic Primary Production in Heated Lakes, (In Polish),
W77-06755 5C

Changes in the Structure of Phytoplankton During the First Years of Existence of the Derdap Storage Reservoir, (In Serbo-Croatian),
W77-06786 2H

Phytoplankton and Primary Productivity in the Northeast Gulf of Alaska,
W77-06836 6G

PIEDMONT REGION (NC)
Open Space and Urban Water Management - Phase II: Case Studies and Findings,
W77-06917 6B

PILGRIM NUCLEAR POWER STATION (MASS)
Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

PILOT PLANTS
Plug-In Concept for Pilot Sewage Treatment Plant,
W77-07026 5D

Sludge Dewatering Pilot Plant Design. Part 2,
W77-07088 5D

PIMEPHALES PROMELAS
LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

PISMO CLAMS
Effects of Engineering Activities on the Ecology of Pismo Clams,
W77-06886 5C

PITLESS ADAPTERS
Bits and Pieces,
W77-06866 8G

PITTING (CORROSION)
How to Deal with Pitting and Corrosion.
W77-06869 8G

PLAICE
The Accumulation of Organic Mercury from Sea Water by the Plaice, Pleuronectes platessa L.,
W77-06607 5C

PLANKTON
Chlorine Reactions with Seawater Constituents and the Inhibition of Photosynthesis of Natural Marine Phytoplankton,
W77-06637 5C

Effects of Pressure, Temperature and Oxygen on the Oxygen-Consumption Rate of the Midwater Copepod Gaussia Princeps,
W77-06642 5C

Measurements of Planktonic Biomass in a Reservoir,
W77-06679 5A

Ichthyoplankton of the Eastern Bering Sea,
W77-06845 6G

PLANNING
Use of a Parametric Model as a Tool for Hydrometric Network Planning,
W77-06710 2A

La Science des Systemes dans la Planification des Ressources en Eau,
W77-06736 6A

Environmental Impact Statements in Water Resources Planning and Decision Making,
W77-06738 6E

Improvement of Planning for Post-Development Water Resource Management: A Study of the Weber Basin Project,
W77-06739 6B

Open Space and Urban Water Management - Phase II: Case Studies and Findings,
W77-06917 6B

Who's Minding the Shore. A Citizens' Guide to Coastal Management,
W77-06935 5G

Fail-Safe Waste Treatment System,
W77-07027 5D

PLANTING MANAGEMENT
Antierosion Role of Forest Plantings in the Steppe Zone of the Moldavian SSR, (In Russian),
W77-06745 4C

PLASTICS
Plastic Spheres for Waste Water Treatment.
W77-07028 5D

The Fabric-Lined Purification Basin.
W77-07035 5D

LIBRARY U. OF I. URBANA-CHAMP...

PLEISTOCENE EPOCH
Delaware River: Evidence for Its Former Extension to Wilmington Submarine Canyon,
W77-06966 2E

PNEUMATIC GRAB
A Pneumatic Grab for Obtaining Large, Undisturbed Mud Samples: Its Construction and Some Applications for Measuring the Growth of Larvae and Emergence of Adult Chironomidae,
W77-06613 5A

POIKILOTHERMS
Heat Resistance of Gametes of Marine Invertebrates in Relation to Temperature Conditions Under Which the Species Exist,
W77-06771 5C

POLAND
Long-Term Changes of the Pelagic Primary Production in Heated Lakes, (In Polish),
W77-06755 5C

POLAND (KONIN AREA LAKES)
The Influence of Effluent Heated Waters on the Bottom Fauna of Lakes in the Vicinity of Konin I. Quantitative Relations and Qualitative Composition of the Bottom Fauna of the Konin Lakes Complex, (In Polish),
W77-06749 5C

The Influence of Effluent Heated Waters on the Bottom Fauna of Lakes in the Vicinity of Konin III. An Effort to Explain the Causes and Results of Changes in the Bottom Fauna of Lakes as Influenced by the Inflow of Heated Waters, (In Polish),
W77-06751 5C

The Influence of Heated Effluent Waters on the Water Chemism of Konin Lakes, (In Polish),
W77-06753 5C

Occurrence and Growth of Dreissena Polymorpha Pall. in Lakes Included in a Cooling System, (In Polish),
W77-06754 5C

The Influence of Heated Effluent Waters on the Thermal-Oxygen Relations and Water Transparency in the Konin Lakes Complex, (In Polish),
W77-06756 5C

POLAR REGIONS
Devon Island Ice Cap: Core Stratigraphy and Paleoclimate,
W77-06890 2C

POLIOVIRUS 1
Persistence of Poliovirus 1 in Soil and on Vegetables Grown in Soil Previously Flooded with Inoculated Sewage Sludge or Effluent,
W77-07050 5C

POLITICAL ASPECTS
Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

POLITICAL CONSTRAINTS
Polluters' Profits and Political Response: Direct Control Versus Taxes: Comments and Reply,
W77-06700 5G

POLLUTANT IDENTIFICATION
Petroleum Hydrocarbons from Effluents: Detection in Marine Environment,
W77-06660 5A

The Measurement of Temperature Tolerance: Verification of an Index,
W77-06764 5C

Water Chemistry and Water Quality,

Changing Needs and Opportunities in the Sediment Field,
W77-06964 2J

Sediment Discharge from an Area of Highway Construction, Applemans Run Basin, Columbia County, Pennsylvania,
W77-06969 4C

SEDIMENTATION
Nile Cone: Late Quaternary Stratigraphy and Sediment Dispersal,
W77-06650 2L

Monitoring the Marine Environment Through Sedimentation,
W77-06651 2L

An Executive Summary of Three EPA Demonstration Programs in Erosion and Sediment Control,
W77-06671 5G

Characteristics of Water Flow at the North End of the Wassaw Barrier Island Complex. Wassaw Island Erosion Study, Part II,
W77-06939 2J

Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

Changing Needs and Opportunities in the Sediment Field,
W77-06964 2J

Design and Control of Secondary Settlement Tanks,
W77-07015 5D

Renovated Water from Municipal Sewage Treatment Plants,
W77-07086 5D

SEDIMENTATION RATES
Current Methods Used in the Soil Conservation Service to Estimate Sediment Yield,
W77-06657 4D

Monroe Reservoir, Indiana, Part I: Hydrologic Circulation, Sedimentation, and Water Chemistry Part II: Nutrient Relations,
W77-06982 5C

SEDIMENTS
Effects of Various Ecological Factors on Radiostrontium Uptake in Two Euryhaline Teleosts: Mugil Auratus Risso and Pleuronectes Platessal, (Influence de Divers Facteurs Ecologiques Sur L'Accumulation du Radiostrontium Chez Deux Teleosteens Euryhalins: Mugil Auratus Risso et Pleuronectes Platessa L.),
W77-06777 5C

Iron-Rich Rhythmically Laminated Sediments in Lake of the Clouds, Northeastern Minnesota,
W77-06901 2J

Particulate Transport of Radionuclides 14C and 55Fe to Deep Waters in the Pacific Ocean,
W77-06902 5B

SEEPAGE
Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

SEEPAGE FLUX
A Device for Measuring Seepage Flux in Lakes and Estuaries,
W77-06903 7B

SEISMIC STUDIES
Delaware River: Evidence for Its Former Extension to Wilmington Submarine Canyon,
W77-06966 2E

SELF PURIFICATION
Mixing and Circulation of Lakes and Reservoirs with Air Plumes,
W77-06633 5G

On the Self-Purification of Natural Waters, (In German),
W77-07038 5G

SENSORS
NASA Develops Water Monitoring System,
W77-06912 5A

SEPARATION TECHNIQUE
Clarifier with Overflow Scum Removal,
W77-07092 5D

SEPARATION TECHNIQUES
Partial Extraction of Metals from Aquatic Sediments,
W77-06781 5A

Sludge Separator.
W77-06998 5D

Apparatus for Disposal of Effluents.
W77-07002 5E

Device for Sucking the Upper Layer of a Polluted Water Surface,
W77-07089 5G

SEPTIC TANKS
Anaerobic Digestion and Membrane Separation for the Treatment of Domestic Sewage,
W77-06631 5D

Nutrient Removal and Sludge Disposal Within Septic Systems-Phase III,
W77-06686 5D

Septic Tank Study is Off and Running.
W77-06859 5D

Fate of Nitrogen and Phosphorus in Soils Under Septic Tank Waste Disposal Fields,
W77-06914 5B

The Plight and Promise of On-Site Waste Water Treatment,
W77-07010 5D

SETTLING BASINS
Design and Control of Secondary Settlement Tanks,
W77-07015 5D

The Fabric-Lined Purification Basin.
W77-07035 5D

SEWAGE
New Programs Improve Sensitive Areas of Water and Sewer Systems,
W77-06995 8G

SEWAGE BACTERIA
Septic Tank Study is Off and Running.
W77-06859 5D

SEWAGE DISPOSAL
Phosphates in Soils Treated with Sewage Water: II. Fractionation of Accumulated Phosphates,
W77-07053 5B

Land Application of Sewage Sludge: IV. Wheat Growth, N Content, N Fertilizer Value, and N Use Efficiency as Influenced by Sewage Sludge and Wood Waste Mixtures,
W77-07079 5D

Sludge Dewatering Pilot Plant Design. Part 2,
W77-07088 5D

SEWAGE EFFLUENTS
NASA Develops Water Monitoring System,
W77-06912 5A

Elimination of Anaerobic Digester Supernatant,
W77-07059 5D

SEWAGE SLUDGE
Laboratory Studies on the Effect of Metals on Oxygen Uptake by Sewage Sludge in Brackish Water,
W77-06788 5C

Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

Forms of Sulfur in Sewage Sludge,
W77-07044 5A

Application of Municipal Refuse and Liquid Sewage Sludge to Agricultural Land: II. Lysimeter Study,
W77-07080 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

SEWAGE TREATMENT
Sewage Aeration Impeller-With Automatic De-Icing and Anti-Clogging System,
W77-07001 5D

Method of Waste Treatment and Algae Recovery,
W77-07003 5D

Treatment of Sewage by Electrons and Gammas,
W77-07012 5D

Fast-Tracking Cuts Costs 16% on Advanced Waste Water Plant.
W77-07016 5D

Study on Sewage Flow Dynamics Through Dorr Type Clarifier on Stream, (Synopsis),
W77-07048 5D

Phosphates in Soils Treated with Sewage Water: I. General Information on Sewage Farm, Soil, and Treatment Results,
W77-07052 5G

SEWARD PENINSULA (ALAS)
Birds of Coastal Habitat on the South Shore of Seward Peninsula, Alaska,
W77-06813 6G

SEWERAGE
Anaerobic Digestion and Membrane Separation for the Treatment of Domestic Sewage,
W77-06631 5D

Sewerage for a Rural Resort Area,
W77-06987 5D

Cincinnati's Preventive Maintenance Sewer Program.
W77-06989 5G

Preventive Sewer Maintenance Helps Preserve Historic Annapolis.
W77-06990 8G

Copper Sulfate Fights Root Growth in Sewer Systems,
W77-06991 8G

Contract Services Stretch Sewer Maintenance Budget,
W77-06994 8G

The Plight and Promise of On-Site Waste Water Treatment,
W77-07010 5D

New Visibility for On-Site Waste Treatment Systems,
W77-07013 5D

SEWERS
The Growth Shapers: The Land Use Impacts of Infrastructure Investments.
W77-06601 6D

Control Sewer Corrosion with H2O2,
W77-06993 8G

The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

SHADES CREEK BASIN
Urbanization and Flooding in Shades Creek Basin, Jefferson County, Alabama,
W77-06977 4C

SHEET FLOW
Hydraulics of Sheet Flow in Wetlands,
W77-06929 8B

SHELLFISH
Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

Demersal Fish and Shellfish Assessment in Selected Estuary Systems of Kodiak Island,
W77-06847 6G

SHORE BIRDS
Shorebird Dependence on Arctic Littoral Habitats,
W77-06811 6G

SHORE PROTECTION
Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

SHOREBIRDS
Birds of Coastal Habitat on the South Shore of Seward Peninsula, Alaska,
W77-06813 6G

SHRIMP
Adsorption of Polychlorinated Biphenyl (Aroclor 1254) on Shrimp,
W77-06758 5C

SHRINK-SWELL POTENTIAL
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

SILICA
Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

SILICIC ACID UPTAKE
Effects of Copper on Silicic Acid Uptake by a Marine Phytoplankton Population: Controlled Ecosystem Pollution Experiment,
W77-06621 5A

SILVER
Respiratory Response of Cunners to Silver,
W77-06789 5C

SIMULATION ANALYSIS
Mathematical Models in Hydrology.
W77-06708 2A

On Large-Scale Simulation of Groundwater Flow Systems,
W77-06713 4B

Optimal Operations of Reservoirs in the Harz Mountains,
W77-06715 4A

Mathematical Model of Water Resources Utilization in a River Basin,
W77-06719 4A

Optimal Design and Operation of Reservoir Systems,
W77-06721 4A

Construction and Adjustment of a Two-Layer Mathematical Model of the Llobregat Delta,
W77-06722 4A

Modele Mathematique de Simulation du Systeme des Ressources Hydrauliques Superficielles du Llobregat,
W77-06727 4A

Hybrid Computer Analysis of a Combined Surface Water--Groundwater System,
W77-06729 4B

The Multi-Step Method for Simulation and Optimization of Vistula River Planning Alternatives,
W77-06734 4A

The Out-of-Kilter Algorithm as a Single-Step Method for Simulation and Optimization of Vistula River Planning Alternatives,
W77-06735 4A

Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

Surface Water Network Design by Regression Analysis Simulation,
W77-06963 2E

SIPHONS
Lake Restoration by Bottom Water Siphoning (In German),
W77-06689 5G

SKAHA LAKE (BRITISH COLUMBIA)
Presenting Trends in Lake Eutrophication,
W77-06693 5C

SKYLAB
A Study of the Utilization of EREP Data from the Wabash River Basin,
W77-06670 7B

SLUDGE
Forms of Sulfur in Sewage Sludge,
W77-07044 5A

LIBRARY U. OF I. URBANA-CHAMPAIGN

SLUDGE

Application of Municipal Refuse and Liquid Sewage Sludge to Agricultural Land: II. Lysimeter Study,
W77-07080 5D

SLUDGE DIGESTION
Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

Conditioning and Land Application of Aerobically Digested Sludge,
W77-07058 5D

Elimination of Anaerobic Digester Supernatant,
W77-07059 5D

SLUDGE DISPOSAL
Subsurface Injection-How Much Does It Cost,
W77-07011 5E

Acid Solubilization of Sewage Sludge and Ash Constituents for Possible Recovery,
W77-07017 5E

Fluosolids Incinerator Commissioned at Esher,
W77-07018 5E

Persistence of Poliovirus 1 in Soil and on Vegetables Grown in Soil Previously Flooded with Inoculated Sewage Sludge or Effluent,
W77-07050 5C

Agricultural Disposal of Aerobic Wastewater Sludges in an Urban County,
W77-07057 5D

Conditioning and Land Application of Aerobically Digested Sludge,
W77-07058 5D

Trends in Sludge Treatment and Disposal Practices in the United States,
W77-07083 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

SLUDGE SEPARATORS
Sludge Separator.
W77-06998 5D

SLUDGE TREATMENT
Electron-Beam Irradiation of Waste Products--e.g., For Sterilization of Sewage Sludge and Waste Industrial Products.
W77-06997 5D

Sludge Separator.
W77-06998 5D

Sludge Incineration at Esher.
W77-07020 5E

Screenings Dewatering Press.
W77-07029 5D

The Use of Polymers for Improving Chemical Sludge Dewatering on Sand Beds,
W77-07033 5D

Trends in Sludge Treatment and Disposal Practices in the United States,
W77-07083 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

Effect of Water Work's Sludge on Waste Water Treatment,
W77-07085 5D

Sludge Dewatering Pilot Plant Design. Part 2,
W77-07088 5D

Factors Influencing the Dewatering Characteristics of Sludge,
W77-07097 5D

Recycling of Aluminum Used for Phosphate Removal in Domestic Waste Water Treatment,
W77-07099 5D

SNAILS
Temperature Relations of Puget Sound Thaids in Reference to Their Intertidal Distribution,
W77-06767 5C

Dispersal and Dispersion of Pond Snails in an Experimental Environment Varying to Three Factors, Singly and in Combination,
W77-06773 5C

A Pilot Study on the Design of a Petroleum Hydrocarbon Baseline Investigation for Northern Puget Sound and Strait of Juan de Fuca,
W77-06875 5C

SNAKE RIVER
Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

SNOW SURVEYS
River Basin Snow Mapping at the National Environmental Satellite Service,
W77-06915 2C

SOCIAL ASPECTS
Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

Energy Development: The Environmental Tradeoffs. Volume 4: The Background Papers,
W77-06957 6G

SOCIAL IMPACT
A New Reservoir and Recreational Behavior,
W77-06956 6B

SOCIAL PARTICIPATION
Environmental Pollution: Is There Enough Public Concern to Lead to Action,
W77-06955 6G

SOCKEYE SALMON
Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

SOIL CHEMICAL PROPERTIES
Indicator Values of Vascular Plants in Central Europe, (In German),
W77-06803 2I

SOIL CONSERVATION
Current Methods Used in the Soil Conservation Service to Estimate Sediment Yield,
W77-06657 4D

SOIL CONTAMINATION
Accumulation of Heavy Metals in Soils from Extended Waste Water Irrigation,
W77-07049 5B

SOIL DISPOSAL FIELD S
Fate of Nitrogen and Phosphorus in Soils Under Septic Tank Waste Disposal Fields,
W77-06914 5B

SOIL EROSION
Sediment Discharge from an Area of Highway Construction, Applemans Run Basin, Columbia County, Pennsylvania,
W77-06969 4C

SOIL MECHANICS
A Laboratory Study of Fluid and Soil Mechanics Processes During Hydraulic Dredging (Hydraulische und Bodentechnische Vorgange beim Grundsaugen),
W77-06883 8D

SOIL MOISTURE
Land Forming Systems to Improve Water Use Efficiency,
W77-06761 3F

Smoothing Data with Cubic Splines,
W77-06831 7C

The Significance of Regulating the Water Regime of Agricultural Lands, (In Russian),
W77-06837 3F

A Method of Evaluating a Field Water Capacity Using PF-3, (In French),
W77-06844 2G

SOIL PROFILES
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

SOIL PROPERTIES
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

SOIL SURVEYS
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

SOIL TEXTURE
Depth and Seasonal Fluctuations in the Condition of the Groundwater of the Area Around the City of Ghent (Belgium), (In Dutch),
W77-06681 2G

SOIL TYPES
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

Nutrient Removal and Sludge Disposal Within Septic Systems-Phase III,
W77-06686 5D

A Laboratory Study of Fluid and Soil Mechanics Processes During Hydraulic Dredging (Hydraulische und Bodentechnische Vorgange beim Grundsaugen),
W77-06883 8D

SOIL WATER MOVEMENT
Suprapermafrost Water,
W77-06630 2C

SOILS
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

Phosphates in Soils Treated with Sewage Water: I. General Information on Sewage Farm, Soil, and Treatment Results,
W77-07052 5G

Solubility and Plant Uptake of Cadmium in Soils Amended with Cadmium and Sewage Sludge,
W77-07055 5B

SOLID WASTES
Drying Potato Wastes for Animal Feed as an Alternative Disposal Method.
W77-06947 5D

Composting of Sewage Sludge and Solid Waste Matter,
W77-07084 5D

SOLIDS CONTACT PROCESSES
Advanced Waste Treatment Seminar, Session III, Removal of Solids and Organics, Held at San Francisco, on October 28-29, 1970.
W77-07074 5D

SOLUBILITY
The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

Solubility and Plant Uptake of Cadmium in Soils Amended with Cadmium and Sewage Sludge,
W77-07055 5B

SOLUBILITY EQUATIONS
The Solubility of Nitrogen, Oxygen and Argon in Water and Seawater,
W77-06923 5C

SOUND WAVES
Method of Applying Ozone and Sonic Energy to Sterilize and Oxidize Waste Water,
W77-07007 5D

SOUTH CAROLINA
Algal Supplement Enhancement of Static and Recirculating System,
W77-06933 5C

SOUTH PLATTE RIVER BASIN (COLO)
Water Quality Investigations in the South Platte River Basin, Colorado, 1971-72.
W77-07076 5A

SPATIAL DISTRIBUTION
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

Mississippi Sound Temporal and Spatial Distribution of Nutrients,
W77-06932 5B

SPAWNING
Spawning Herring Surveys in the Bering Sea and Finfish Resource Surveys in Norton Sound and Kotzebue Sound,
W77-06828 6G

SPECIES COMPOSITION
Response of Macro-Zooplankton Populations to Copper: Controlled Ecosystem Pollution Experiment,
W77-06620 5A

SPECIFIC GRAVITY
Device for Sucking the Upper Layer of a Polluted Water Surface,
W77-07089 5G

SPILLWAYS
Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

SPORES
Effect of Salinity on Spore Germination of Terrestrial and Marine Fungi,
W77-06772 5C

ST. LAWRENCE RIVER
Nutrients, Chlorophyll, and Internal Tides in the St. Lawrence Estuary,
W77-06910 5B

STABILITY
Profiles and Evaporation,
W77-06898 2D

STABILIZATION
Sand Stabilization on the Dunes, Beach and Shoreface of a Historically Eroding Barrier Island. Wassaw Island Erosion Study, Part III,
W77-06940 8G

STATISTICAL METHODS
Smoothing Data with Cubic Splines,
W77-06831 7C

STATISTICS
Smoothing Data with Cubic Splines,
W77-06831 7C

STEAM
Guidelines for the Preparation of Environmental Reports for Fossil-Fueled Steam Electric Generating Stations,
W77-06918 6G

STEAM GENERATING STATIONS
First Reported Incidence of Gas-Bubble Disease in the Heated Effluent of a Steam Generating Station,
W77-06922 5C

STEELHEAD TROUT
Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

STEMFLOW
Investigation of Precipitation Within Forest Ecosystems, (In Hungarian),
W77-06797 2B

STERILANTS
Method of Applying Ozone and Sonic Energy to Sterilize and Oxidize Waste Water,
W77-07007 5D

LIBRARY U. OF I. URBANA-CHAMP

STERILANTS

STOCHASTIC PROGRAMMING
Optimal Complex Use of Controlled Water Resources of a Basin,
W77-06718 4A

STORAGE
Lake St. Clair Hydrologic Transfer Factors.
W77-06879 2H

STORM RUNOFF
Sediment Discharge from an Area of Highway Construction, Applemans Run Basin, Columbia County, Pennsylvania,
W77-06969 4C

London's Stormwater Problem,
W77-06983 5D

Sediments and Water Quality of Urban Storm Water,
W77-06984 5B

Short Course Proceedings: Applications of Stormwater Management Models,
W77-07066 5B

Introduction to Urban Storm Water Runoff Models,
W77-07071 5B

Simplified Methods of Computing the Quantity of Urban Runoff,
W77-07072 5B

The WRE Storm Model,
W77-07073 5B

On-Line Adaptive Control for Combined Sewer Systems,
W77-07100 5D

STORM WATER
An Executive Summary of Three EPA Demonstration Programs in Erosion and Sediment Control,
W77-06671 5G

London's Stormwater Problem,
W77-06983 5D

Time-Distribution of Storm Rainfall in Pennsylvania,
W77-07022 2B

Treatment of Combined Sewer Overflows Via Thin Film Chemistry,
W77-07034 5D

Short Course Proceedings: Applications of Stormwater Management Models,
W77-07066 5B

Integrated Approach to Urban Waste Water Management,
W77-07095 5D

On-Line Adaptive Control for Combined Sewer Systems,
W77-07100 5D

STORMS
Time-Distribution of Storm Rainfall in Pennsylvania,
W77-07022 2B

STRAIT OF JUAN DE FUCA
A Pilot Study on the Design of a Petroleum Hydrocarbon Baseline Investigation for Northern Puget Sound and Strait of Juan de Fuca,
W77-06875 5C

STRATIGRAPHY
Nile Cone: Late Quaternary Stratigraphy and Sediment Dispersal,
W77-06650 2L

STREAM-AQUIFER MODELS
Further Development and Testing of a Stream-Aquifer System Model,
W77-06762 2F

STREAMFLOW
Streamflow Regulation by Artificial Recharge Fed from Upstream Surface Storage: Derivation of Control Rules,
W77-06725 4A

Surface Water Network Design by Regression Analysis Simulation,
W77-06963 2E

STREAMS
Influence of Gradient on the Distribution of Fishes in Conowingo Creek, Maryland and Pennsylvania,
W77-06635 2I

Water Quality Simulation of Tahoe-Truckee System, Nevada-California-Volume I,
W77-07075 5B

Water Quality Investigations in the South Platte River Basin, Colorado, 1971-72.
W77-07076 5A

STRENGTH
Laboratory Study of the Flexural Strength and Elastic Modulus of Freshwater and Saline Ice,
W77-06661 2C

SUB-LETHAL EFFECTS
Evaluation of Potential Indicators of Sub-Lethal Toxic Stress on Marine Zooplankton (Feeding, Fecundity, Respiration and Excretion): Controlled Ecosystem Pollution Experiment,
W77-06617 5A

SUBLETHAL EFFECTS
Induction of Hepatic Microsomal Enzymes by Aroclor 1254 in Ictalurus punctatus (Channel Catfish),
W77-06759 5C

SUBMERGED OFFSHORE DIFFUSER
Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

SUBMERSIBLE PUMPS
Pumping Systems: The Simpler, The Better,
W77-06856 8C

Submersible Pump Design: Dependent on Well Diameter and Depth.
W77-06867 8C

SUBSURFACE FLOW
Comparison of Iterative Methods of Solving Two-Dimensional Groundwater Flow Equations,
W77-06965 2F

SUBSURFACE INJECTION
Subsurface Injection-How Much Does It Cost,
W77-07011 5E

SUBSURFACE INVESTIGATIONS
On Large-Scale Simulation of Groundwater Flow Systems,
W77-06713 4B

SUBTROPIC
Stratification of Kinetic Origin and its Biological Consequences in a Neotropical Man-Made Lake,
W77-06683 2H

SUGARCANE
Particle Characteristics and Dispersal Patterns of Sugar Cane Wastes in Selected Rivers and Estuaries of Puerto Rico,
W77-06632 5B

SULFATES
Biogenic Elements and Sulfate Reduction in Water Oil Carbonate Layer, (In Russian),
W77-07040 5B

SULFIDES
The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

SULFUR COMPOUNDS
The Use of Oxygen to Treat Sewage in a Rising Main,
W77-06996 5D

Forms of Sulfur in Sewage Sludge,
W77-07044 5A

SUPERSATURATION
A Preliminary Evaluation of the Effects of Gas Bubble Disease on Fish Populations in the Kootenai River Below Libby Dam,
W77-06919 5C

Occurrence of Gas-Bubble Disease in Three Species of Bivalve Molluscs,
W77-06921 5C

Observations on Gas Bubble Disease in Adult Columbia River Sockeye Salmon (Oncorhynchus Nerka),
W77-06924 5C

Dissolved Nitrogen, Dissolved Oxygen and Related Water Temperatures in the Columbia and Lower Snake Rivers, 1965-1969,
W77-06925 5C

Effect of Atmospheric Gas Supersaturation Caused by Dams on Salmon and Steelhead Trout of the Snake and Columbia Rivers (A Review of the Problem and the Progress Toward a Solution, 1974),
W77-06927 5C

Evaluation of Alternative Solutions to Gas Bubble Disease Mortality of Menhaden at Pilgrim Nuclear Power Station,
W77-06928 5G

SUPRAPERMAFROST WATER
Suprapermafrost Water,
W77-06630 2C

SURFACE MINING
Debris Basins for Control of Surface Mine Sedimentation,
W77-06672 5G

SURFACE RESISTANCE
Evaporation and Advection II: Evaporation Downwind of a Boundary Separating Regions Having Different Surface Resistances and Available Energies,
W77-06897 2D

SURFACE WATERS
Modele Mathematique de Simulation du Systeme des Ressources Hydrauliques Superficielles du Llobregat,
W77-06727 4A

Conjunctive Use of the Tajo-Segura Aqueduct Surface System and the Aquifers of the La Mancha Area,
W77-06728 4B

Hybrid Computer Analysis of a Combined Surface Water--Groundwater System,
W77-06729 4B

Reconnaissance of the Water Resources of the Clinton Quadrangle, West-Central Oklahoma,
W77-06959 7C

Surface Water Network Design by Regression Analysis Simulation,
W77-06963 2E

SURFACES
Evaporation and Advection II: Evaporation Downwind of a Boundary Separating Regions Having Different Surface Resistances and Available Energies,
W77-06897 2D

SURFACTANTS
LAS Inhibition of Diffusion and Uptake of Tritiated Uridine During Teleost Embryogenesis,
W77-06611 5C

SURVEYS
Seasonal Distribution and Abundance of Marine Birds,
W77-06815 6G

The Distribution, Abundance and Diversity of the Epifaunal Benthic Organisms in Two (Alitak and Ugak) Bays of Kodiak Island, Alaska,
W77-06849 6G

Effects of Engineering Activities on the Ecology of Pismo Clams,
W77-06886 5C

Hydrologic Interpretation of Geophysical Data from the Southeastern Hueco Bolson, El Paso and Hudspeth Counties, Texas,
W77-06970 4B

Review and Analysis of Hydrogeologic Conditions Near the Site of a Potential Nuclear-Waste Repository, Eddy and Lea Counties, New Mexico,
W77-06974 5B

SUSPENDED SOLIDS
Foam and Film of Fresh Waters as an Ecological Niche of Aquatic Hyphomycetes, (In Russian),
W77-06787 2I

Design and Control of Secondary Settlement Tanks,
W77-07015 5D

SWINE-WASTE LAGOONS
Pollutant Movement to Shallow Ground Water Tables from Swine Waste Lagoons,
W77-06742 5B

SYRDARYA RIVER (MIDDLE ASIA)
Mathematical Model of Water Resources Utilization in a River Basin,
W77-06719 4A

SYSTEM SCIENCE
La Science des Systemes dans la Planification des Ressources en Eau,
W77-06736 6A

SYSTEMS ANALYSIS
La Science des Systemes dans la Planification des Ressources en Eau,
W77-06736 6A

TAHOE-TRUCKEE WATER SYSTEM (NEV AND CALIF)
Water Quality Simulation of Tahoe-Truckee System, Nevada-California-Volume I,
W77-07075 5B

TASTE
Identity, Origin and Development of Off-Flavors in Great Lakes Anadromous Fish,
W77-06931 5A

TECHNOLOGY
A Pneumatic Grab for Obtaining Large, Undisturbed Mud Samples: Its Construction and Some Applications for Measuring the Growth of Larvae and Emergence of Adult Chironomidae,
W77-06613 5A

TECHNOLOGY TRANSFER
Proceedings Technology Transfer Seminar on Waste Handling, Disposal and Recovery in the Metal Finishing Industry, November 12-13, 1975, Toronto, Ontario.
W77-06950 5D

TELEOSTS
Effects of Various Ecological Factors on Radiostrontium Uptake in Two Euryhaline Teleosts: Mugil Auratus Risso and Pleuronectes Platessal, (Influence de Divers Facteurs Ecologiques Sur L'Accumulation du Radiostrontium Chez Deux Teleosteens Euryhalins: Mugil Auratus Risso et Pleuronectes Platessa L.),
W77-06777 5C

TEMPERATURE
Effects of Pressure, Temperature and Oxygen on the Oxygen-Consumption Rate of the Mid-water Copepod Gaussia Princeps,
W77-06642 5C

A Note on Temperature and Humidity Profile Measurement Over Forests Using Diodes,
W77-06653 7B

Exchange Through a Barrier Island Inlet: Additional Evidence of Upwelling Off the Northeast Coast of North Carolina,
W77-06654 2L

The Measurement of Temperature Tolerance: Verification of an Index,
W77-06764 5C

Seasonal changes in the Respiration of Pumpkinseed, Lepomis Gibbosus, Correlated with Temperature, Day Length, and Stage of Reproductive Development,
W77-06768 5C

The Algal Flora in the Thermal Baths of Montegrotto Terme (Padua). Its Distribution Over One-Year Period,
W77-06770 5C

Effect of Salinity on Spore Germination of Terrestrial and Marine Fungi,
W77-06772 5C

Effects of Various Ecological Factors on Radiostrontium Uptake in Two Euryhaline Teleosts: Mugil Auratus Risso and Pleuronectes Platessal, (Influence de Divers Facteurs Ecologiques Sur L'Accumulation du Radiostrontium Chez Deux Teleosteens Euryhalins: Mugil Auratus Risso et Pleuronectes Platessa L.),
W77-06777 5C

Reproductive Cycle of Trout and Tench: Effect of Experimental Variations of the Temperature, (Etude Sur le Cycle Reproducteur do la Truite Arc-En-Ciel et de la Tanche: Effet de Variations Experimentales de la Temperature),
W77-06779 5C

Plant Data Analysis of Temperature Significance in the Activated Sludge Process,
W77-07046 5D

TEMPERATURE LIMITATION
Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Umatilla Drainage Basin,
W77-06602 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Area, Grande Ronde Drainage Basin,
W77-06603 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Powder Drainage Basin,
W77-06604 2G

Oregon's Long Range Requirements for Water. General Soil Map Report with Irrigable Areas, Malheur River Drainage Basin,
W77-06605 2G

Oregon's Long-Range Requirements for Water. General Soil Map Report with Irrigable Areas, Owyhee Drainage Basin,
W77-06606 2G

TEMPERATURE PROFILES
A Single Field of View Method for Retrieving Tropospheric Temperature Profiles from Cloud-Contaminated Radiance Data,
W77-06887 2B

TEMPORAL DISTRIBUTION
Mississippi Sound Temporal and Spatial Distribution of Nutrients,
W77-06932 5B

TENCH
Reproductive Cycle of Trout and Tench: Effect of Experimental Variations of the Temperature, (Etude Sur le Cycle Reproducteur do la Truite Arc-En-Ciel et de la Tanche: Effet de Variations Experimentales de la Temperature),
W77-06779 5C

TERRACING
Land Forming Systems to Improve Water Use Efficiency,
W77-06761 3F

TERTIARY TREATMENT
Expansion Comes Quickly to AWT Plant,
W77-07009 5D

Fast-Tracking Cuts Costs 16% on Advanced Waste Water Plant.
W77-07016 5D

Plug-In Concept for Pilot Sewage Treatment Plant,
W77-07026 5D

Fail-Safe Waste Treatment System,
W77-07027 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

TEXAS
Hydrologic Interpretation of Geophysical Data from the Southeastern Hueco Bolson, El Paso and Hudspeth Counties, Texas,
W77-06970 4B

Control Sewer Corrosion with H2O2,

LIBRARY U. OF I. URBANA-CHAMPAIGN

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Subject Fields

- 1 NATURE OF WATER
- 2 WATER CYCLE
- 3 WATER SUPPLY AUGMENTATION AND CONSERVATION
- 4 WATER QUANTITY MANAGEMENT AND CONTROL
- 5 WATER QUALITY MANAGEMENT AND PROTECTION
- 6 WATER RESOURCES PLANNING
- 7 RESOURCES DATA
- 8 ENGINEERING WORKS
- 9 MANPOWER, GRANTS, AND FACILITIES
- 10 SCIENTIFIC AND TECHNICAL INFORMATION

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 15
AUGUST 1, 1977

THE LIBRARY OF THE
AUG 22 1977
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

W77-07101 -- W77-07600
CODEN: SWRABW

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

LIBRARY U. OF I. URBANA-CHAMPAIGN

VOLUME 10, NUMBER 15
AUGUST 1, 1977

W77-07101 -- W77-07600

ecretary of the U.S. Department of the Interior has de-
ied that the publication of this periodical is necessary in the
action of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

HYDROLOGY,
Geological Survey, Reston, Va. Water Resources Div.
L. A. Heindl.
Encyclopedia Britannica Book of the Year, Earth Sciences, (Chicago), p 264-265, 1977.

Descriptors: *Water resources development, *Water supply, *Water pollution control, *United States, Reviews, Remote sensing, Satellites(Artificial), Aerial photography, Waste disposal, Surface waters, Groundwater, Ice, Snow management.

This review of water-resources problems in the United States summarizes the increasing demands for water supplies, hazards of water pollution, and measures being taken to cope with these problems. Withdrawal of groundwater doubled in the U.S. in the past 20 years. By 1976 groundwater provided between one-quarter and one-third of all water used for all purposes, and about half the people in the U.S. depended on it for their domestic supplies. The emphasis of investigations during the year was on the maintenance of groundwater quality. This is particularly a problem where wastes are being injected into the subsurface. Widespread concern for the continuing supply of clean fresh water resurrected interest in the use of mineralized and saline waters for nonpotable domestic, industrial, and agricultural purposes. The use of combinations of data from Landsat 1 and 2 and other satellites demonstrated the practicality of using remote sensing from satellites and high-flying aircraft for preliminary hydrological assessments of the water regimens of large areas. Reports of working groups of the U.S. National Committee for the International Hydrological Decade stressed the need in the United States for better coordination of research in snow-and-ice hydrology, increased application of already proven nuclear techniques in field studies and investigations, more realistically structured programs for drainage-basin research, and additional emphasis on basis hydrology in the university curricula of future water resources experts. SYSTEMS APPROACH AND WATERSHED MODELS,
Regional Engineering Coll., Rourkela (India).
G. Krishnaswamy.
Indian Journal of Power and River Valley Development, Vol 24, No 6, p 179-183, June 1974. 4 fig, 7 ref.

Descriptors: *Watersheds(Basins), *Mathematical models, *Hydrology, Parametric hydrology, Stochastic processes, Systems analysis, Simulation analysis, Water resources, Planning.
Identifiers: Component modeling.

Watershed models must be able to forecast floods and the effects of change of land use on various hydrologic phenomena. The types of such models used in hydrology are physical models based on the laws of scaling, analogue models based on the mathematical identity of the governing equations of physically different systems, and mathematical or conceptual models for describing mathematically the response of catchment to the processes of precipitation and evaporation. Considered is the development of the mathematical models for watershed analysis, with particular emphasis on the systems approach. The ideal model would specify completely the properties of and processes occurring in all the relevant components of the watershed. Thus, the hydrologic effects of a rainfall event over a watershed could be determined objectively through modeling. The solution of such problems may involve statistical analysis of samples of observed data or may deal with the interrelationships among individual hydrologic parameters or groups of parameters. The former method of approach can be classified under stochastic hydrology, the latter under parametric hydrology. The systems approach is one method of tackling such problems. The overall operation of the hydrologic system is examined, the complex physical laws of the internal system components not being considered. The process of development of the mathematical watershed model is described, the various available models are indicated, and the enormous possibility of further research work in this new field is hinted. (Bell-Cornell)

2B. Precipitation

THE EFFECT OF SOIL MOISTURE ON CIRCULATION AND RAINFALL IN A TROPICAL MODEL,
British Meteorological Office, Bracknell (England).
J. Walker, and P. R. Rowntree.
Quarterly Journal of the Royal Meteorological Society, Vol. 103, No. 435, p 29-46, January 1977. 13 fig, 5 tab, 32 ref.

Descriptors: *Model studies, *Rainfall, *Tropical regions, *Africa, Mathematical models, *Soil moisture, Arid lands, Deserts, Circulation, Evaporation, Albedo, Energy budget, Heat balance, Persistence, Foreign countries, Foreign research.
Identifiers: *Sahel(Africa), *Sahara.

The sensitivity of a tropical model to soil moisture content was investigated, using a simplified version of the UK Meteorological Office 11-layer model. The model area represented a zonally symmetric version of West Africa. The results of one experiment (D) with a desert in the same latitudes as the Sahara were compared with those of another experiment (W) in which the desert was replaced by moist land. The initial fields contained an idealized easterly wave which developed during the experiments to form depressions whose movement, structure, and associated rainfall were strongly influenced by the dryness of the underlying surface. The energetics of these disturbances were analyzed, and two distinct mechanisms for maintaining their eddy kinetic energy were proposed, depending on the soil moisture. Results from W suggest that once the land was moist it maintained itself in this state for at least several weeks. In D, however, the initial aridity north of 14 deg N was sustained, suggesting that ground dryness alone can cause deserts to persist. An analysis of observed rainfall data for the northern Sahel provided much stronger evidence for the persistence of rainfall anomalies from year to year than did similar analyses for the southern Sahel. The possibility that soil moisture anomalies could contribute to this persistence was briefly discussed. (Humphrey-ISWS)

DYNAMICS OF CLIMATIC HAZARDS IN NORTHEAST BRAZIL,
Wisconsin Univ., Madison. Dept. of Meteorology.
S. Hastenrath, and L. Heller.
Quarterly Journal of the Royal Meteorological Society, Vol. 103, No. 435, p 77-92, January 1977. 8 fig, 3 tab, 31 ref.

Descriptors: *Climatology, *South America, *Rainfall, *Droughts, Forecasting, Floods, Seasonal, Climatic data, Circulation, Air circulation, Analysis, Foreign countries, Meteorology.
Identifiers: *Brazil(Northeast region).

Departure characteristics of the large-scale circulation were studied in relation to extreme drought and flood years in northeastern Brazil. Ship observations during 1911-72, compiled with a one degree square resolution and extending between 30 deg N and 30 deg S from the African coast to the eastern Pacific, form a major observational basis. The rainy season of northeastern Brazil is narrowly centered around March/April and is related to the southernmost seasonal migration of a lower-tropospheric confluence axis over the adjacent eastern tropical Atlantic. The 'Secas' of Ceara province are characterized by an equatorward expansion of the South Atlantic, and a poleward retraction of the North Atlantic high--associated with a northward displacement of the enclosed near-equatorial trough of low pressure. Concurrently, the zonally oriented bands of maximum cloudiness and precipitation frequency stay farther north, the North Atlantic trades weaken, and the South Atlantic trades become stronger than in the long-term mean. The sea surface temperature pattern during a deficient rainy season in northeast Brazil is characterized by positive departures in a broad band across the North Atlantic and in the eastern Pacific, and anomalously cold waters in most of the South and equatorial Atlantic. During abundant rainy seasons in northeast Brazil, departure patterns are approximately in-

LIBRARY U. OF I. URBANA-CHAMPAIGN

verse to those patterns typical of drought years. A strong negative linkage exists between northeast Brazil rainfall and sea surface temperature along the Ecuador/Peru coast. This seems to be caused by inverse long-term pressure variations over the eastern South Pacific and South Atlantic oceans, which in turn may be part of large-scale mass adjustments of the Southern Oscillation type. Development of the equatorward expansions of the North and South Atlantic highs, preseason precipitation in northeast Brazil and the Guayanas, and location of the cloudiness and precipitation belts over the adjacent western tropical Atlantic are among the more promising predictors for seasonal foreshadowing of extreme rainy season behavior in northeast Brazil. (Humphreys-ISWS)
W77-07167

ESTIMATING ABOVE AND BELOW NORMAL RAINFALL PERIODS OVER SOUTH AFRICA, 1972-2000,
University of the Witwatersrand, Johannesburg (South Africa).
T. G. J. Dyer, and P. D. Tyson.
Journal of Applied Meteorology, Vol. 16, No. 2, p 145-147, February 1977. 1 fig, 12 ref.

Descriptors: *Rainfall, *Estimating, *Climatology, *Africa, Precipitation(Atmospheric), Forecasting, Mathematical model, Time series analysis, Droughts, Wet seasons, Meteorology.
Identifiers: *South Africa, Rainfall predictions.

By fitting a trigonometrical regression model to a regionally averaged time series for the period 1910-72 and by extrapolation to the year 2000, an estimate of future extended wet and dry spells was made for the summer rainfall region of South Africa. It was suggested that the periods 1972-81 and 1991-2000 will experience above normal rainfall and that the period 1981-90 will be drier than normal. Results to date show that mean regional rainfall for the hydrological years 1972-73 to 1975-76 has conformed to the suggested pattern. (Sims-ISWS)
W77-07170

PARAMETERIZATION OF DEPOSITIONAL ICE GROWTH,
Utah Water Research Lab., Logan.
K. G. Hubbard.
Journal of Applied Meteorology, Vol. 16, No. 2, p 177-182, February 1977. 4 fig, 2 tab, 12 ref, 2 append. NSF GA-43181.

Descriptors: *Ice, *Crystal growth, *Model studies, *Mathematical models, Crystals, Cloud physics, Precipitation(Atmospheric), Particle size, Meteorology.
Identifiers: Parameterization.

The physics of ice nucleation as a temperature-dependent process was incorporated into a parameterized equation which simulates the depositional growth of ice at the expense of liquid and vapor phases. The depositional parameterization was examined in the framework of a parcel model, and the results were compared to a more detailed ice model containing 20 mass categories of ice crystals. Comparisons showed that the parametric and detailed models yield nearly identical results. A computational advantage is present with the parameterization because the necessary size distribution information is greatly reduced and the time step is much larger. (Sims-ISWS)
W77-07171

DIGITAL RAINGAGE RECORDER,
Siena Coll., Loudonville, N.Y. Dept. of Physics.
D. P. Donnelly.
Journal of Applied Meteorology, Vol. 16, No. 2, p 205-207, February 1977. 4 fig, 5 ref.

Descriptors: *Rain gages, *Instrumentation, *Rainfall, Equipment, Precipitation(Atmospheric), Time, Timing, Rates, Meteorology.
Identifiers: *Recorders, Recording systems, Digital recorders.

A digital raingage recording system was described. The apparatus includes a tipping bucket raingage and an electronic system which prints out the time of day each time the bucket tips. The electronic system operates on direct current and is capable of printing 3 lines per second. With a bucket mechanism designed to trip on 0.254 mm of rain, a rainfall rate of 1000 mm/h would require 1.1 lines per second. (Sims-ISWS)

W77-07175

SIMULATION OF A SERIES OF DAILY AREAL MEAN RAINFALLS FOR A BASIN USING RAINFALL OBSERVATIONS AT A REFERENCE STATION LOCATED OUTSIDE THE BASIN,
Institut Royal Meteorologique de Belgique, Brussels. Hydrology Section.
F. Bultot, and G. L. Dupriez.
Hydrological Sciences Bulletin, Vol 21, No 4, p 569-585, December 1976. 7 fig, 7 tab, 3 ref.

Descriptors: *Rainfall, *Watershed(Basins), *Model studies, *Mathematical models, Correlation analysis, Time series analysis, Estimating, Estimating equations, Probability, Foreign countries, Distribution patterns, Foreign research, Weather patterns, Precipitation(Atmospheric), Meteorology.
Identifiers: *Belgium.

A mathematical model was built which enables daily estimates to be made of the areal mean rainfalls for a basin using rainfall observations at a reference station of the same climature, but which may be situated at some distance from the basin. The method consistes of: (1) determining the probabilities of the characteristic types of association between areal mean rainfalls of varying magnitude at the basin and rainfall events of various types at the reference station, (2) establishing the conditional distributions of areal mean rainfalls at the basin, and (3) estimating the areal mean rainfalls at the basin by the Monte Carlo method and by accepting that the mean basin rainfalls and the reference station rainfall are, in their respective statistical distributions, fractiles of the same order. The validity of the simulated series was checked by means of various tests. (Sims-ISWS)

PHYSICAL PROBLEMS OF WEATHER MODIFICATION,
Warsaw Univ. (Poland). Faculty of Geophysics.
For primary bibliographic entry see Field 3B.
W77-07357

PREDICTABILITY OF EFFECTS OF A SEVERE LOCAL STORM IN PENNSYLVANIA,
Agricultural Research Service, University Park, Pa. Northeast Watershed Research Center.
W. J. Gburek, R. L. Hendrick, A. S. Rogowski, and M. L. Paul.
Journal of Applied Meteorology, Vol 16, No 2, p 136-144, February 1977. 9 fig, 3 tab, 13 ref.

Descriptors: *Precipitation(Atmospheric), *Rainfall, *Excessive precipitation, *Pennsylvania, Storms, Thunderstorms, Hurricanes, Erosion, Sheet erosion, Rill erosion, Soil erosion, Runoff, Watersheds(Basins), Rain gages, Stream gages, Rainfall disposition, Precipitation intensity, Precipitation excess, Soil water movement, Surface runoff, Subsurface runoff, Meteorology.
Identifiers: *Hurricane Agnes.

On 24 May 1975, an isolated thunderstorm in east-central Pennsylvania produced more than 4 inches of rain in 2 h over an Agricultural Research Service instrumented area. The return period for that storm appears to exceed 650 years. Simulation of the precipitation excess from all soils within the storm area, using a modification of the Mein and Larson infiltration equation, indicated surface runoff from a limited number of soil types--the same soils which exhibited severe erosion plus the alluvial soils of the stream channels. About 17% of the area affected by the storm accounted for nearly all of the measured surface runoff. Post-storm field investigation showed that the principal damage by erosion was restricted to corn fields on two soil groups, both silty clay loams over a fragipan. Soil losses due to sheet and rill erosion were estimated in the field as ranging from 15 to 110 tons/acre. Soil losses resulting from gully erosion could have been as high as 300 tons/acre in some areas. Simulation of the event by using modification of the universal soil loss equation showed that the location and amount of damage could have been predicted. Analysis of the impact of the storm illustrated that: (1) the lack of a general wind field which would give the storm horizontal motion accounted for the extreme 2 h rainfall, (2) presently available techniques for the simulation of runoff and erosion can be successful under these most extreme conditions, and (3) the source-area concept of runoff and sediment production must be considered in modeling such events. (Sims-ISWS)
W77-07369

MAXIMUM 5-MINUTE AND HOURLY RAINFALLS ON METROMEX NETWORK, 1971-1975,
Illinois State Water Survey, Urbana.
F. A. Huff, and J. L. Vogel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 714, Price codes: A05 in paper copy, A01 in microfiche. Circular 126, 1977. 81 p, 1 fig, 2 ref, 1 append. NSF ENV 73-07796.

Descriptors: *Rainfall, *Data collections, *Illinois, *Missouri, Networks, Measurement, Hydrology, Hydrologic data, Urban hydrology, Cities, Rainfall intensity, Basic data collections, On-site data collections.
Identifiers: *METROMEX.

During the summers (June-August) of 1971-1975, a network of 223 recording raingages was operated in circular area of 2000 sq mi centered on the St. Louis Gateway Arch. This network was operated in conjunction with Metromex (Metropolitan Meteorological Experiment) which involved comprehensive research concerning urban effects upon precipitation (inadvertent weather modification). The weighing bucket raingages were spaced approximately 3 mi apart, with the recording charts rotating once every 24 hours, which permitted reading of rainfall amounts for any period of 5 minutes or longer. Heavy rainfall data from this network were tabulated. The first set of data lists gage, data, and amount for each occurrence of point rainfall that equalled or exceeded 0.45 inch in 5 minutes. This corresponds to the 5-minutre rainfall having an average recurrence interval of 2 years at any given point in the Metromex network. The second set of data provides similar information for hourly rainfall amounts that equal or exceed the average 2-year recurrence value of 1.50 inches. Raingage amounts were listed for every storm during the summers of 1971-1975 in which one or more gages recorded an hourly amount of 1.50 inches or more. Hourly amounts were listed for each gage for each hour during each storm. The date of the storm, its time

of occurrence, and the synoptic storm type associated with the rainfall were shown. Legal descriptions of the raingage locations were included as an appendix to this report for the convenience of the user. (See also W76-03353, W76-06680 and W76-09734) (Humphreys-ISWS)

AN OXYGEN-ISOTOPE CLIMATIC RECORD FROM THE DEVON ISLAND ICE CAP, ARCTIC CANADA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Polar Continental Shelf Project.
W. S. B. Paterson, R. M. Koerner, D. Fisher, S. J. Johnsen, and H. B. Clausen.
Nature, Vol. 266, No. 5602, p 508-511, April 7, 1977. 6 fig, 23 ref.

Descriptors: Isotope studies, *Oxygen, Ice, , *Glaciers, *Canada, Climates, *Climatic data, Climatology, Dating, Radioactive dating, Cores, Core logging, Temperature, Laboratory tests, Data processing, Glaciology.
Identifiers: *Devon Island(Canada), *Ice caps, *Greenland.

Isotope measurements on two adjacent cores through the Devon Island ice cap provide a well-dated climatic record for the past 5000 yr. Fluctuations in annual values include much 'noise', and ice flow over a rough bed produces distortions in the lowest 5% of core which covers roughly 120,000 yr. Comparison with the Camp Century, Greenland, record helped to separate climatic changes from changes in ice thickness or flow pattern. (Sims-ISWS)
W77-07175

FRAZIL--THE INVISIBLE STRANGLER,
Department of the Environment, Ottawa (Ontario). Inland Water Directorate.
D. M. Foulds, and T. E. Wigle.
American Water Works Association Journal, Vol. 69, No. 4, p 196-199, April 1977. 10 fig, 3 ref.

Descriptors: *Frazil ice, *Intake structures, *Great Lakes, Lakes, Rivers, Ice, Crystals, Cooling, Radiation, Temperature, Water temperature, Winds, Mixing, Freezing, On-site investigations, Ice loads.

Frazil is an ice phenomenon that usually occurs between midnight and dawn and only when the water has become supercooled. Frazil can choke intakes and open channels through its 'stickiness,' blocking the water flow to facilities. The development of frazil was traced, and suggestions to alleviate the problems it causes were made. (Sims-ISWS)
W77-07177

RECTILINEAR LEADS AND INTERNAL MOTIONS IN THE ICE PACK OF THE WESTERN ARCTIC OCEAN,
Department of the Environment, Victoria (British Columbia). Inst. of Ocean Sciences.
J. R. Marko, and R. E. Thomson.
Journal of Geophysical Research, Vol 82, No 6, p 979-987, February 20, 1977. 9 fig, 1 tab, 14 ref.

Descriptors: *Sea ice, *Arctic Ocean, *Ice cover, *Remote sensing, Satellites(Artificial), Rock mechanics, Movement, Winds, Water circulation, Currents(Water), Stress, Shear stress, Cold regions, Arctic.
Identifiers: *Ice leads, Faults(Ice), Fractures(Ice), Rectilinear leads, Brittle fracture, LANDSAT, *Ice packs.

Large-scale (100 km) rectilinear lead patterns are a common feature of the Arctic Ocean ice cover. It was shown that many of the characteristics of these patterns can be explained by analogy with rock mechanics. In particular, the existence of two intersecting lead sets, the typical intersection angles of 28 deg, and the observed relative shearing motions are consistent with faulting associated with semibrittle failure. Further support for this explanation has been obtained by using NOAA and Landsat satellite imagery over an approximately 100-km-square area of the Beaufort Sea. These data provided coverage of 2 days of ice deformation prior to the formation of a lead at 14 deg to the axis of compression. Strains of 4% over the 2-day period were within the range attributed to rock distortion preceding semibrittle failure. It was suggested that the range from brittle to plastic type behavior is feasible within the Arctic Ocean sea ice, depending upon the applied rate of strain and/or the ambient confining pressures. SNOW AND ICE HYDROLOGY IN THE UNITED STATES--CURRENT STATUS AND FUTURE DIRECTIONS,
National Committee for the International Hydrological Decade, Washington, D.C.
Work Groups on Snow and Ice Hydrology, Final Report 1976. 73 p, 86 ref, 2 append.

Descriptors: *International hydrologic decade, *United States, *Snow, *Ice, *Hydrology, Glaciers, *Research priorities, Reviews, Documentation, Research and development, Planning, Instrumentation, Remote sensing, Surveys, *Bibliographies.
Identifiers: *Research needs.

The Work Group on Snow and Ice Hydrology was organized to coordinate U.S. efforts in this field and to promote the development of knowledge in the area. The Work Group identified four major areas in which it could make significant contributions: (1) Identification of research needs and accomplishments; (2) Improvement of the fragmented communications in the U.S. within the field of snow and ice studies; (3) Elimination, wherever possible, of the duplication of effort; and (4) Translation of research results into applications and management techniques. The primary function of this report was to discharge the responsibilities under the first objective. This was done through a critical review of the field of snow and ice hydrology, which resulted in identification of major problems as well as research needs. On the basis of this review, several recommendations were made, which if implemented, will help to satisfy the last three objectives. (Humphreys-ISWS)

MISSOURI RIVER POWER CURVE REGRESSION EQUATIONS,
Missouri Univ., St. Louis. Dept. of Geology.
L. J. Lee.
Journal of Hydrology, Vol. 33, No. 1/2, p 123-132, March 1977. 2 tab, 19 ref.

Descriptors: *Missouri River, *Regression analysis, *Statistical methods, Discharge(Water), Width, Depth, Slopes, Meanders, Flow, Streamflow, Hydrologic properties, Equations, Correlation analysis, Analytical techniques, Data processing, Hydrology, Rivers, *Computer programs.
Identifiers: Power curve equations.

By the use of a statistical computer program power curve regression, equations and correlation coefficients were developed for as many river parameters as could be accurately quantified for the Missouri River. This was done with the expectation that these equations would be useful in (1) sorting from the many river parameters those variables that are strongly relted, and (2) aid in predicting changes the river might undergo as a result of the manipulative behavior of man. Results indicated that the equations developed may be useful for both purposes. (Sims-ISWS)

Descriptors: *Watersheds(Basins), *Runoff, *Foreign countries, *Flood discharge, Europe, Hydrology, Surface waters, Rives, Statistical methods, Correlation analysis, Regression analysis, Frequency, Flood recurrence interval, Flood flow.
Identifiers: *Switzerland, *Aar River(Switzerland).

The peak discharge Q sub T of a flood (annual series) with a recurrence interval T was ascertained using equation Q sub t = (A sub T) (S to the a power) for the upper reaches of the River Aar above the city of Bern, Switzerland. In the equation, S = basin area, and a and A sub T are basin parameters. The discharge Q sub T was calculated from direct measurements at hydrological stations on the river after extrapolation of short series and correction of possible erros. A sub T and a were calculated by linear regression, and their values were established between the logarithms of Q sub T and S. (Humphreys-ISWS)

MANNING N AND THE OVERLAND FLOW EQUATION,
Agricultural Research Service, Stillwater, Okla.
W. O. Ree, F. L. Wimberly, and F. R. Crow.
Transactions of the American Society of Agricultural Engineers, Vol 20, No 1, p 89-95, January-February 1977. 7 fig, 5 tab, 9 ref.

Descriptors: *Mannings equation, *Watersheds(Basins), *Overland flow, *Model studies, Laboratory tests, Small watersheds, Hydrograph analysis, Grassed waterways, Range grasses, Flow, Runoff, Vegetation, Channel flow, Hydraulics, Hydrology.

Manning n values for the overland flow surfaces of a grassed watershed were derived by hydrograph analysis and by using average watershed slope and overland flow length values determined by geomorphic methods. These values were compared with Manning n values from laboratory tests on channels having similar grass covers. Close agreement was found for poor grass, but not for fair and good grass. The methods can be used to estimate the overland flow equation for an ungaged watershed if a Manning n value for the overland flow surface can be estimated. (Sims-ISWS)

STREAMFLOW REGIONALIZATION IN BRITISH COLUMBIA, NO. 2, REGRESSION OF MEAN ANNUAL FLOWS ON PHYSIOGRAPHIC PARAMETERS,
Department of the Environment, Vancouver (British Columbia). Inland Water Directorate (Pacific Region); and Department of the Environment, Vancouver (British Columbia). Water Resource Branch.
R. M. Leith.
Report Series No. 46, 1976, Ottawa, Canada, 21 p., 4 fig., 3 tab, 5 ref, 4 append.

Descriptors: *Streamflow, *Average flow, Regions, Regression analysis, Parametric hydrology, Drainage, Drainage area, Ponding, Sampling, River basins, Mathematical models, *Canada.
Identifiers: *British Columbia, *Annual flows.

Mean annual flows have been regressed on physiographic parameters for 62 hydrometric stations in British Columbia. The equation for unit mean annual flow, UMAF, UMAF = 10.4 + 0.0319 NPOSI - 0.172 x 1/100 ELEV - 0.131 x 1/100 DSNW - RAFOR + 0.909 RASWP + 0.758 x 1/10,000 SEW explained 61% of the total variation and had a standard error of estimate of 1.71 cfs/sq.mi. This equation was developed by backward elimination of variables and was tested by examination of residuals, by geographic plot, by runs test and by tests of normalcy. In the process of building the equation, subsamples of the 62 stations were taken and regression equations developed. This allowed the identification of important parameters, other than those which appear in the above equation. For example, Barrier Height to North, BHN, appeared in five of the seven intermediate equations. (See also W76-04180) (WATDOC)

EFFECTS OF THE CATASTROPHIC FLOOD OF DECEMBER 1966, NORTH RIM AREA, EASTERN GRAND CANYON, ARIZONA,
Geological Survey, Cheyenne, Wyo. Water Resources Div.; Geological Survey, Tucson, Ariz.; and Prescott Coll., Ariz.
M. E. Cooley, B. N. Aldridge, and R. C. Euler.
Availabile from Supt. of Documents, GPO Washington, DC 20402, price $2.70. Professional Paper 980, 1977. 43 p, 41 fig, 1 plate, 3 tab, 18 ref.

Descriptors: *Floods, *Flood damage, *Mudflows, *Maximum probable flood, *Arizona, Flood data, Channel erosion.
Identifiers: *Grand Canyon(Ariz), North rim.

Precipitation from the unusual storm of December 1966 was concentrated on highlands in northern Arizona, southwestern Utah, southern Nevada, and south-central California and caused widely scattered major floods in the four States. In Arizona the largest amount of precipitation was in the north rim area of eastern Grand Canyon, where about 14 inches was measured. The largest flows occurred along Bright Angel Creek and the MilK Creek-Dragon Creek part of the Crystal Creek drainage basin. The maximum effects of the flood were along Milk Creek-Dragon Creek, where a mudflow caused extensive channel modification. Floods that occurred in the Bright Angel and Crystal Creek basins have a recurrence interval of only once in several centuries. The streamflow that resulted from the storm on the Kaibab Plateau caused considerable local scouring and deepening of channels, including some renewed arroyo cutting. The most catastrophic effects of the 1966 floods were caused by two mudflows that extended from the edge of the Kaibab Plateau along Dragon Creek in the Crystal Creek basin and Lava Creek in the Chuar Creek basin to the Colorado River. More than 10 other large mudflows occurred in Nankoweap, Kwagunt, Crystal, and Shinumo Creek basins. About 80 large debris slides left conspicuous scars in the amphitheaters at the heads of the side gorges, and at least 10 small slides occurred on the Kaibab Plateau. (Woodard-USGS)

NON-EQUILIBRIUM THERMODYNAMICS OF GROUNDWATER FLOW SYSTEMS: SYMMETRY PROPERTIES OF PHENOMENOLOGICAL COEFFICIENTS AND CONSIDERATIONS OF HYDRODYNAMIC DISPERSION,
Nevada Univ., Reno. Desert Research Inst.
C. L. Carnahan.
Journal of Hydrology, Vol. 31, No. 1/2, p 125-150, September 1976. 2 tab, 50 ref. OWRT B-067-NEV(2).

Descriptors: *Groundwater, *Groundwater movement, *Thermodynamics, Dispersion, Porous media, Hydrology, Base flow, Hydrodynamics, Mathematical studies.
Identifiers: *Hydrodynamic dispersion, Transport process, Phenomenological coefficients, Anisotropic media, Groundwater hydrology, Dissipation function, Transformed coefficients.

The theory of non-equilibrium thermodynamics was applied to transport processes in groundwater flow systems. The theory was postulated to be applicable to a continuum model of porous medium in which fluxes and forces at points in the fluid phase are averaged over a representative elementary volume. Group-theoretic principles were applied to the phenomenological coefficients, and it was shown that these considerations can simplify the phenomenological equations both by removing unallowed coupled effects and by reducing the ap-

parent number of independent, numerical components contained in a given phenomenological coefficient. It was found, for example, that in porous media having certain symmetry properties, chemical reaction rates cannot be coupled to vector flows of heat and matter. Examination of the current theory of hydrodynamic dispersion in the light of non-equilibrium thermodynamics led to a proposed modification of the former. It was proposed that phenomenological coefficients for coupled and direct dispersive processes be formed of the product of a fourth-rank tensor, dispersivity of the medium, with the dyadic product of solute velocities, rather than with fluid flow velocities. Group theory was applied to the resulting coefficients, and new results were obtained for the forms assumed by the coefficients in certain anisotropic media. (Lee-ISWS)

TYPE CURVES FOR ANALYSIS OF PUMP TESTS IN LEAKY STRIP AQUIFERS,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
A. Vandenberg.
Journal of Hydrology, Vol. 33, No. 1/2, p 15-26, March 1977. 5 fig, 1 tab, 5 ref.

Descriptors: *Curves, *Pumping, *Aquifer testing, *Mathematical models, *Observation wells, Graphical methods, Test wells, Aquifers, Leakage, Analytical techniques, Boundaries(Surfaces), Drawdown, Theis equation, Transmissivity, Storage coefficient.
Identifiers: *Type curves, *Strip aquifers, *Leaky aquifers, Time-drawdown curves, Matching procedure, Image wells.

The analysis of pump test data for strip aquifers, for example, buried bedrock channels, can be carried out by fitting the early part of the time-drawdown curve with the Theis non-equilibrium curve or with one of Hantush's curves for leaky aquifers. The width of the strip can then be deduced from the behavior of the later part of the time-drawdown curve. However, if the width of the strip is of the same, or less, magnitude as the distance between pumped well and observation well, the method can no longer be applied since the boundaries cause a strong deviation from the type curves even at early times. Also, analysis of the data by the Theis method leads to a severe underestimation of the transmissivity. The boundary value problem for linear horizontal groundwater flow in a leaky aquifer towrds a face of constant discharge was formulated and then solved, leading to an expression from which transmissivity can be determined by a type-curve matching procedure similar to the Hantush and theis methods for radial flow. FINITE-ELEMENT ANALYSIS OF GROUNDWATER FLOW IN MULTIAQUIFER SYSTEMS, I. THE BEHAVIOR OF HYDROLOGICAL PROPERTIES IN AN AQUITARD WHILE BEING PUMPED,
Kyoto Univ. (Japan). Dept. of Agricultural Engineering.
K. Fujinawa.
Journal of Hydrology, Vol. 33, No. 1/2, p 59-72, March 1977. 6 fig, 11 ref.

Descriptors: *Groundwater movement, *Aquitards, *Model studies, Mathematical models, Groundwater, Aquifers, Pumping, *Finite element analysis, Analytical techniques, Flow, Movement, Hydrologic properties, Hydrology.
Identifiers: *Multiaquifer systems.

In multiaquifer systems, aquifers are separated by aquitards through which water flows from one aquifer to another. The asumption of vertical flow in aquitards and horizontal flow in aquifers has been found reasonble in many field situations and has been utilized in the design of quasi three-dimensional flow models. It has also been revealed by earlier workers that the vertical leakage is affected by the storage in the aquitard as well as by its permeability and the properties of the adjacent aquifers. In this paper, one-dimensional, finite-element analysis was used to determine the effect of storage in an aquitard separating two confined aquifers on the distribution of hydraulic head in the aquitard and on the flux from or into the adjacent aquifer. This paper also considered how many nodes are required to solve the problem numerically with adequate accuracy. The results of this study should be helpful in the design of numerical schemes for analyzing multiaquifer systems. (Sims-ISWS)

ANALYSIS OF FLOW AGAINST DISPERSION IN POROUS MEDIA,
Birmingham Univ. (England), Dept. of Civil Engineering.
A. N. S. Al-Niami, and K. R. Rushton.
Journal of Hydrology, Vol. 33, No. 1/2, p 87-97, March 1977. 3 fig, 1 tab, 9 ref, 2 append.

Descriptors: *Dispersion, *Porous media, *Model studies, Mathematical models, Soil water movement, Groundwater movement, Aquifers, Groundwater, Flow, Aqueous solutions, Water quality, Pollutants, *Path of pollutants, Water pollution, Hydrology.

Analytical solutions were presented for dispersion in a finite porous media which is controlled by the flow of a low concentration fluid towards a region of higher concentration. The flow was assumed to be one-dimensional in a horizontal direction. A step function concentration was enforced at the source of the dispersion, while zero concentration, or a condition in which the change in concentration is proportional to the flow, was applied at the other boundary. Different forms for the solutions were given to facilitate the computation of particular values. Special attention was paid to the situation when the flow balances the effect of the dispersion. SPECIFIC YIELD DETERMINATIONS FROM A CONSOLIDATED SANDSTONE AQUIFER,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
M. Price.
Journal of Hydrology, Vol. 33, No. 1/2, p 147-156, March 1977. 4 fig, 23 ref.

Descriptors: *Specific yield, *Aquifers, *Sandstones, *Laboratory tests, Centrifugation, Groundwater, Groundwater movement, Groundwater resources, Pores, Porosity, Pore water, Hydrologic properties, Specific retention, Water storage, Hydrology, Foreign research, Foreign countries.

The centrifuge method of measuring specific yield was described briefly. Measurements of samples of Penrith Sandstone from a site in Cumbria indicate a much higher value than that derived from a pumping test by curve fitting. A previous explanation for the discrepancy, based on a capillarity mechanism, is only partly borne out by further work, but the mechanism could be significant at other sites in other aquifers. Further research is needed to define standard conditions for measuring specific yield by the centrifuge method. (Sims-ISWS)

CALCULATION OF THE LEAKY AQUIFER FUNCTION,
Canterbury Univ., Christchurch (New Zealand). Dept. of Civil Engineering.
B. Hunt.
Journal of Hydrology, Vol. 33, No. 1/2, p 179-183, March 1977. 6 ref.

Descriptors: *Aquifers, *Model studies, *Mathematical models, Equations, Formulas, Analytical techniques, Mathematics, Wells, Water wells, Pumping, Transmissivity, Hydrology.
Identifiers: *Leaky aquifer function, Infinite series functions.

Two infinite series representations were obtained for the leaky aquifer function of Hantush and Jacob. These infinite series are absolutely convergent and can be used to calculate values of the leaky aquifer function for all possible values of the arguments. Some example calculations were carried out. (Sims-ISWS)
W77-07156

LOCATION OF FREE SURFACE IN POROUS MEDIA,
Cornell Univ., Ithaca, N.Y. Dept. of Civil and Environmental Engineering.
J. A. Liggett.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 103, No. HY4, Proceedings Paper 12851, p 353-365, April 1977. 7 fig, 6 ref, 3 append.

Descriptors: *Free surfaces, *Porous media, *Mathematical models, Equations, Numerical analysis, Boundaries(Surfaces), Groundwater movement, Water table, Steady flow, Unsteady flow, Permeability, Seepage.
Identifiers: Boundary integral equation method, Coefficient matrices.

The boundary integral equation method (BIEM) was applied to the problem of locating the free surface in both steady and unsteady flow through porous media. The method is numerical in its application and uses boundary data only. Thus, the position of the free surface can be found without solving the complete flow problem. The method can be continued to find the solution to the complete problem. The method is especially efficient when the solution is desired at a limited number of points (e.g., on a failure surface in determining slope stability) or in a limited area of the flow. Examples were given in which there is a free surface and a seepage surface and in which zones of different permeability appear. (Visocky-ISWS)

ANALOG-MODEL ANALYSIS OF REGIONAL THREE-DIMENSIONAL FLOW IN THE GROUND-WATER RESERVOIR OF LONG ISLAND, NEW YORK,
Geological Survey, Mineola, N.Y. Water Resources Div.
R. T. Getzen.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $1.35. Professional Paper 982, 1977. 49 p, 40 fig, 4 tab, 58 ref.

Descriptors: *Analog models, *Groundwater movement, *Aquifer characteristics, *Model studies, Hydrogeology, Groundwater recharge, Seepage, Surface-groundwater relationships, Analytical techniques, Regression analysis, Hydraulic conductivity, Specific yield, New York.
Identifiers: *Long Island(NY), Three-dimensional flow.

A three-dimensional analog model of the groundwater system beneath Long Island, N.Y., provides a practical means for studying anisotropic flow on a regional scale. Constructional and operational techniques influence the simulation almost as much as model design does. Usefulness and accuracy of the model depend on (1) inherent and practical limitations of the finite-difference method, (2) accuracy and completeness of the data base, and (3) accuracy of the assumptions and approximations that were made in applying the simulation technique to this particular ground-water reservoir. Reliable data used in design of the model are (1) horizontal hydraulic conductivity and thickness of three major aquifers, (2) extent of confining beds, (3) specific yield, and (4) locations of streams. Estimates of vertical hydraulic conductivity and specific storage were applied to the model. Most spatially fixed model boundaries are good representations of prototype (real-world) boundaries. Most dynamic boundaries are only approximately represented, and some dynamic boundaries require application of unproved assumptions. The simulated ground-water reservoir generally agrees with prototype hydrology, and the model is being used for predictive studies. (Woodard-USGS)

HORIZON HYDRAULIC CONDUCTIVITIES DETERMINED IN SITU FOR THE WILDERNESS, MEXICO AND MENFRO SOILS AND USED TO PREDICT SOIL WATER CONTENT,
Missouri Univ.-Columbia. Dept. of Agronomy.
J. C. Doll.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 339, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. dissertation, December 1976. 180 p, 47 fig, 14 tab, 60 ref, 2 append. OWRT B-005-MO(3), B-022-MO(3), 14-01-0001-556- 1845 and 3025.

Descriptors: *Limestone, Soils, Seismographs, Soil types, *Soil water, *Hydraulic conductivity, *Soil properties, Evapotranspiration.
Identifiers: *Soil matrix potential, Wilderness soils, Mexico soils, Menfro soils.

The interrelationships between hydraulic conductivity, soil matrix potential and soil water content were determined by in situ methods for a fragipan soil of the Wilderness series, a claypan soil of the Mexico series and a deep loess soil of the Mexico series. Hydraulic properties of a draining profile were determined by the instantaneous profile method. Hydraulic properties of a wetting profile were determined by the crust infiltration method for the Mexico and Menfro soils. The hydraulic conductivity values determined by both methods compared favorably when examined at a given matrix potential. Hydraulic conductivities decreased sharply as the soil dried from saturation. The hydraulic conductivity of all horizons in all soils approached a value of 0.01 cm/day. This supports the use of a field capacity definition based upon an hydraulic conductivity of 0.01 cm/day. The measured hydraulic properties of the Menfro soil were used in a soil-plant-atmosphere model (Saxton, 1974) to predict seasonal soil water content. The predicted amounts of soil water and evapotranspiration were compared with measured seasonal amounts of soil water at a forested Menfro site and with evapotranspiration estimated by the method of Thornthwaite and Mather. The model prediction of actual evapotranspiration computed by Thornthwaite's method (assumed to be equal to actual evapotranspiration at the forested Menfro site) was 127.32 cm for the same 18 month period. Close agreement was found between the observed and predicted time distribution of total amounts of water in the soil.

Identifiers: Galerkin method, Time steps, Iteration, Wetting front.

A finite element, weighted residual, successive substitution algorithm was used to solve two-dimensional infiltration problems whose governing partial differential equation and boundary conditions are highly nonlinear. The results compared favorably with other published numerical solutions to similar examples. The soil water diffusivity, as well as the capillary conductivity, were approximated within a finite element in terms of shape functions and discretized values of these functions calculated using guessed values or previously calculated values at a certain time level of the water content at the nodes. This successive substitution scheme converged rapidly within each time step. The method is general and can be extended to three-dimensional flows and the use of higher order approximations. Identifiers: *Suction head, Wet front, Richards equation, Green-Ampt model.

Richard's equation governs the soil moisture movement in the unsaturated zone. However, practical difficulties in using the equation are the

nonavailability of soil properties and excessive computer costs. The Green-Ampt approach has been found to hold a promise of being used as a good approximation to Richards' equation. The suction head at wet front is the important information that is needed in the use of the Green-Ampt equation. Mein and Larson have defined S sub av for this purpose. The validity of this definition was discussed. The suction head at the wet front was re-defined and denoted as S sub ig x S sub av (theta) sub*, and S sub ig (theta) sub * was compared for a typical clayey soil. The variation of S sub ig with moisture content was shown graphically for five soils. The conditions favorable for application of the Mein-Larson model were identified. (Sims-ISWS)

AUTOMATIC MONITORING OF SOIL MOISTURE CONDITIONS IN A HILLSLOPE SPUR AND HOLLOW,
Bristol Univ., (England). Dept. of Geography.
M. G. Anderson, and T. P. Burt.
Journal of Hydrology, Vol. 33, No. 1/2, p 27-36, March 1977. 6 fig, 6 ref.

Descriptors: *Soil moisture, *Tensiometers, *Automation, Soil water, Slopes, Soil water movement, Runoff, Base flow, Instrumentation, On-site investigations, Hydraulic conductivity, Unsaturated flow, Storms, Precipitation(Atmospheric), Rainfall, Topography, Hydrology, Foreign research.
Identifiers: *England.

An automatic recording tensiometer system was designed and installed to record the spatial variation of soil moisture in a hillslope spur and hollow. Results were presented which demonstrate the significant control of topography on soil moisture conditions and the resulting stream flow response. From the storm event examined and the month-long recession which followed, the hillslope hollow was shown to be significant in both generating a throughflow peak in stream discharge and in maintaining the subsequent base flow. (Sims-ISWS)

WATER FLUX IN SOIL AND SUBSOIL ON A STEEP FORESTED SLOPE,
Forest Service (USDA), Corvallis, Oreg. Pacific Northwest Forest and Range Experiment Station.
R. D. Harr.
Journal of Hydrology, Vol. 33, No. 1/2, p 37-58, March 1977. 8 fig, 3 tab, 45 ref. NSF GB-38610X.

Descriptors: *Soil water movement, *Slopes, *Forests, *Oregon, On-site investigations, Soils, Soil properties, Soil water, Infiltration, Flow, Unsaturated flow, Tensiometers, Piezometers, Precipitation(Atmospheric), Runoff, Streamflow, Subsurface flow, Subsurface runoff, Subsurface waters, Storms, Subsoil.

Soil analyses and tensiometer, piezometer, and precipitation data were used to evaluate water flux in soil and subsoil on a steep forested slope. Although unsaturated flow predominated in the soil during fourteen moderate-size winter storms, discontinuous saturation of upslope subsoil did occur at depths of 110-150 cm after at least 30 mm of rain fell in 12 h or less. This saturation persisted les than 20 h. Very slight changes in soil water pressure head during storms effected relatively large changes in both magnitude and direction of water flux. Maximum water fluxes in the top meter of soil were 3-4.5 mm/h, and maximum flux in the subsoil was 0.5 mm/h, slightly less than the minimum flux in the soil. Between storms, the vertical component of flux at the 10-cm depth was much less than the downslope component, but the component of flux equaled the downslope component during storms. Conversely, vertical components of flux at 70- and 130-cm depths were much less than downslope components during storms, but the vertical components equaled downslope components between storms. Analysis of piezometric levels, discharge from a seep, and streamflow revealed an abrupt decrease in rate of water flux to the lower part of the slope about 10 h after the end of rainfall. This decrease corresponded with nearly complete draining of larger pores that had filled with water during storms. Subsurface flow and channel interception averaged 97 and 3% of storm flow which, in turn, averaged 38% of total storm precipitation. No overland flow was observed. (Sims-ISWS)

Identifiers: *Hydrogen ions, *Magnesium ions, *Sodium ions, *Nuclear magnetic resonance.

Five water retention zones (in the soil) were detected in suspensions of cation-substituted forms of kaolinite by the NMR method. The state of combined water depends on the type of exchangeble cations. Na+ and H+ demonstrate similar effects in the region of low concentrations: in the high concentration region similar effects are exerted by Mg2+ and H+.--Copyright 1977, Biological Abstracts, Inc.

WATER MOVEMENT IN SOIL FROM TRICKLE SOURCE,
Utah State Univ., Logan. Dept. of Agriculture and Irrigation Engineering.
A. Y. Hachum, J. F. Alfaro, and L. S. Willardson.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. IR2, Proceedings paper No. 12204, p 179-192, June 1976. 9 fig, 3 tab, 10 ref.

Descriptors: *Groundwater movement, *Flow, *Deep percolation, *Irrigation, *Seepage, *Water sources, Design, Loam, Silts, Equations, Soils, Water distribution(Applied).
Identifiers: *Trickle irrigation.

A two-dimensional water movement within a homogeneous soil profile from a surface water line source was investigated. In the experiment, various trickle water application rates were used to irrigate two types of soil. The effect of soil type and water application rate on the movement and distribution of water within the soil profile were considered. The experiment revealed that for the same volume of water, the vertical penetration of wetting front decreased and the horizontal water movement increased as the water application rate increased. The water movement in the horizontal and vertical directions was described by an exponential equation and the two-dimensional wetting pattern in the soil profile was approximated by a semiellipse without a significant loss of accuracy. A general mathematical consideration, utilizing the results of the present work for designing a tricle irrigation system is presented. A simple field test for obtaining system design parameters is described. (Bell-Cornell)

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 103, No. HY4, Proceedings Paper 12873, p 395-407, April 1977. 6 fig, 12 ref, 3 append.

Descriptors: *Circulation, *Environmental engineering, *Lakes, *Water circulation, *Mathematical models, Temperature, Model studies, Water pollution, Winds, Thermocline, Turbulent flow, *Forecasting.
Identifiers: *Three-dimensional model, *Steady-state circulation, Far field, Reverse flow, Wind circulation, Wind stresses.

A three-dimensional model was developed for the prediction of steady-state circulation induced by the discharges, wind stresses, and horizontal temperature gradients in the far field regions of shallow lakes. For the case of lakes having rectangular geometrics and uniform depth, explicit analytical solutions were presented for the velocity distribution. The results of the analysis showed that a negative temperature gradient along the lake in a given direction gives rise to a flow in the same direction at the upper layer of the lake and to a reverse flow at the lower layer. The circulations induced by horizontal temperature gradients could be as important as those generated by wind stresses. (Roberts-ISWS)

A new method in physical limnology, based on the radioactive tracer tritium and its stable daughter product, 3He, was examined. The 3He produced by the in situ decay of tritium can be used to calculate an effective water mass age. These ages can then be used to estimate gas exchange rates, gas renewal at turnover, and vertical diffusivity in the epilimnion. (Sims-ISWS)

In 1971-1973, the bream (Abramis brama) of thermally shallow Lake Obelija (S. Lithuania) had parasitofauna more numerous (23 spp.) than other lakes studied. The same parasites were found in bream caught in thermally deep Lake Galstas. Bream parasitofauna were considerably less numerous (12 spp.) in thermally deep Lake Slavantas, where benthos is scarce. The paucity of bream parasitofauna (9 spp.) in thermally modestly deep Lake Dusia may be accounted for by the scarcity of bream population and its acclimitization there.--Copyright 1977, Biological Abstracts, Inc.

Identifiers: Crater lakes, *Oxygen-18, *Lake Piccolo(Italy).

The thermometric measurements and the isotopic composition of the O2 of Lake Piccolo water samples indicate that this lake is made up of 2 different water bodies. That nearest the surface shows strong variations in temperature (from 5-21C) and 18O content (delta 18O: from -6.7 to -5.5%) whereas in the deeper water the temperature increases progressively towards the lake bottom with an anomalous temperature gradient (2.5C in 20 m) and the isotopic composition remains considerably constant and more negative that the surface part delta 18O: from -9.5 to -.88%). The thermal and isotopic anomalies are interpreted as the result of the particular feeding of the lake itself, i.e., mainly from springs emerging from the lake bottom. The springs come from the Vulture slopes at heights of more than 900 m. Measurements carried out in Lago Grande show that the thermal and isotopic variations are similar to those of other Italian lakes.--Copyright 1977, Biological Abstracts, Inc.

S. Outcalt, and P. Kilham.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1333-1338, 1975. 4 fig., 7 ref.

Descriptors: *Mathematical models, *Water temperature, *Diffusivity, *Thermal properties, Depth, *Temporal distribution, Equations, Annual, Model studies, Simulation analysis, Theoretical analysis, Mixing, *Lakes.

A model is given through which sophisticated simulations of freeze up-break of ice can be made and which requires only an initial thermal profile and minimal weather data. Analytical schemes frequently employed to generate thermal evolutionary histories from an initial temperature profile and from the sequence of surface temperature observations fail because the effective diffusivity includes density downmixing during the cooling portion of the year. In addition, the upper layers are mixed by the wind in the absence of ice cover. When the first depth derivative of temperature is constant at the computation node, then the second depth derivative would be zero, and the effective diffusivity would be infinite, as observed when the monthly mean depth-dependent thermal regimes of mid-latitude lakes are arrayed. To calculate the time and depth-dependent thermal diffusivity of lake water, finite difference equations are used, representing temperture depth, time, second depth derivative of temperature, depth extent of thermal disturbance, Fourier Modulus, node number, density temperature node at base of wind mixed region node at top of bottom sediment and absolute value of arg. The model was designed to operate from daily total solar radiation, cloud cover, air temperature, air relative humidity, and wind velocity. (Auen-Wisconsin)

REMOTE SENSING OF TURBIDITY PLUMES IN LAKE ONTARIO,
Geological Survey, Reston, Va.
E. J. Pluhowski.
Transportation Engineering Journal of ASCE, Proceedings of the American Society of Civil Engineers, Vol. 102, No. TE3, Proceedings paper No. 12306, p 475-488, August 1976. 13 fig, 6 ref.

Descriptors: *Lake Ontario, *Remote sensing, *Currents, *Beach erosion, Lakes, Rivers, Turbidity, Hydrology, Monitoring, Outlets.
Identifiers: *Turbidity plumes.

Space imagery and high-altitude photography provide an effective method of monitoring the dynamics of turbidity plumes in Lake Ontario. The Niagara River Plume, as much as 200 sq miles (520 km) in area, is by far the largest turbidity feature in the lake. Plume analyses corroborate the presence of a prevailing eastward flowing longshore current along the entire south shore of the lake. This current is most persistent at the Oswego River outlet but it is quite variable in the Rochester embayment, where rapid shifts in water movement were occasionally detected. The position of the spring thermal bar, a zone of maximum density water corresponding in the 4 C isotherm, was located near the Niagara River outlet in images obtained during April, 1973. DISTRIBUTION THICKNESS AND CERTAIN PHYSICAL AND CHEMICAL PROPERTIES OF BOTTOM SEDIMENTS IN THE KIEV RESERVOIR, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
I. A. Zapol'skii, and B. G. Es'kov.
Gidrobiol Zh 12(2), p 22-30, 1976.

Descriptors: *Distribution, *Bottom sediments, Reservoirs, *Sediment distribution.
Identifiers: Dreissensia, Paludian, USSR, Unio, *Kiev Reservoir(Ukranian SSR), *Sediment thickness.

In connection with the construction of the Kiev reservoir (Ukranian SSR, USSR) the water regime of the Dnieper (River) changed. This resulted in reformation of the bottom sediments. A survey of bottom sediments for the period of the reservoir's existence and rocks formed before its filling established variations in the sediment distribution. Considerable changes are observed in indexes of composition and properties of the sediments(Eh decrease, Ph increase, decrease in specific weight, growth in coefficients of porosity and maximum molecular moisture content). Plant remains and shells of Unio, Dreissensia and Paludinia in bottom sediments are mentioned.--Copyright 1976, Biological Abstracts, Inc.

THE DUNE BOOK. HOW TO PLANT GRASSES FOR DUNE STABILIZATION,
North Carolina State Univ. at Raleigh. Center for Marine and Coastal Studies.
J. Seltz.
North Carolina University Sea Grant Publication No. UNC-SG-76-16, December 1976. 16 p. SG-04-6-158-44054.

Descriptors: *Grasses, *Dunes, Sands, Sedimentation, Resources development, *North Carolina, Bank stabilization.
Identifiers: *Dune stabilization, Ammophila breviligulata, Uniola paniculate, Panicum amarum, Spartina patens, American beachgrass, Sea oats, Bitter panicum, Saltmeadow cordgrass.

Engineers have tried to copy nature by building dunes with bulldozers and dredges or by stringing long fences across the sand. A simpler, usually less expensive and often more successful method exists where blowing sand is available. By planting sand and sand-resistant grasses anyone (homeowners and developers, restaurant owners and motel keepers) can encourage the wind to slow and drop its load of sand, beginning the natural cycle of dune growth. A grass planting 40 to 50 feet wide can trap several cubic yards of blowing sand per foot of beach in a year. Four grasses meet the requirements in North Carolina: American beachgrass, Sea oats, Bitter panicum and Saltmeadow cordgrass. (NOAA)

ACOUSTIC MEASUREMENT OF SEDIMENT TRANSPORT,
Canada Centre for Inland Waters, Burlington (Ontario).
C. K. Jonys.
Scientific Series No. 66, 1976, Ottawa, Canada, 118 p., 64 fig., 10 tab., 18 ref., 2 append.

Descriptors: *Acoustics, *Measurement, *Sediment transport, Research and development, Bed load, Sounding, Analysis, Underwater, Hydrophones, River beds, *Instrumentation, On-site tests, Laboratory tests, Theoretical analysis.
Identifiers: *Pebbles, Collision.

Three studies are combined on the acoustic method of sediment bed-load measurement in gravel-bearing rivers. Laboratory experiments were carried out to verify some acoustical aspects of impact noise in water for application in the development of a theoretical relationship between the noise generated by riverbed pebble collisions and bed-load transport rates. Underwater pebble noise was simulated by rolling ceramic balls on a bed of similar balls in a large laboratoy flume. Sound was measured with a stationary hydrophone located in the water above the pebble bed. Specific information was obtained on the interparticle collision frequency delineating the limit of transition from impact to continuous type of sound; the applicability of theoretical relationship in the determination of total sound pressure levels owing to impact sources; the acoustic directivity of pebble collision noise; the sound field characteristics surrounding pebble collision sources; the effect of pebble velocity on the generated sound pressure level; and the spectrum characteristics of the pebble collision generated noise. In field experiments, underwater sound samples were recorded in two gravel-bearing rivers during periods with and without bed-load movement. Also, samples of artificially generated interparticle collision noise by different sizes of gravel pebbles were recorded. Flow velocities and bed-load transport were measured as well. The purpose of the observations was to obtain field data for the study of the feasibility of the acoustic method for bed-load measurement.(WATDOC)

MATHEMATICAL MODELING OF SEDIMENTATION TRANSIENTS IN SAND-BED CHANNELS,
Colorado State Univ., Fort Collins, Engineering Research Center.
K. Mahmood, and V. M. Ponce.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 274, Price codes: A07 in paper copy, A01 in microfishe. Research Report No. CER75-76KM-VMP28, April 1976. 132 p, 17 fig, 12 ref, 3 append.

Descriptors: *Sediment transport, *Alluvial channels, *Computer models, Numerical analysis, *Mathematical models, Sedimentation, Streams, Stream erosion, Suspended load, Hydrology, Aggradation, Degradation.
Identifiers: *Sand-bed channels, Sedimentation transients, Sedimentation Courant number.

A mathematical model of sedimentation transients in straight alluvial channels was presented. A coupled solution of the momentum and sediment continuity equations enables the numerical solution with longer time steps than are possible for uncoupled models. The model solves the finite difference analog of the governing equations by a linerized implicit numerical scheme. The linerization imposes the limitation that for a time step Delta t the change in depth of flow Deta h/h be less than 0.10. Criteria were developed to assess the stability and cnvergence properties of the numerical scheme. Theoretically optimum values of the weighting factor delta and a sedimentation Courant number were presented. Results of test runs derived from hypothetical examples were presented. The numerical model effectively simulates the formation of a bed wave in the upstream reach of a straight alluvial channel due to a non-equilibrium sediment inflow hydrograph. Examples of various types of aggradation and degradation problems that can be simulated by the model were given. (Lee-ISWS)

RECONNAISSANCE OF SEDIMENT TRANSPORT AND CHANNEL MORPHOLOGY IN THE LOWER RIO BERMEJO BASIN, ARGENTINA--WITH A SECTION ON RECONNAISSANCE OF THE LOWER RIO PILCOMAYO BASIN, ARGENTINA AND PARAGUAY,
Geological Survey, Harrisburg, Pa. Water Resources Div.
J. R. Ritter.
Open-file report 76-564, 1977. 41 p, 18 fig, 1 plate, 6 tab, 16 ref.

Descriptors: *Sediment transport, *Streamflow, *Sediment yield, *Channel morphology, *South America, Stream erosion, Alluvial channels, Sediment load, Sediment control, Evaluation.
Identifiers: *Argentina, *Lower Rio Bermejo basin(Arg-Para), *Paraguay, *Lower Rio Pilcomayo basin(Arg).

Sediment transport conditions are described for the Lower Rio Bermejo and the Rio Pilcomayo in the Gran Chaco region of northern Argentina and southern Paraguay. The Lower Rio Bermejo is in many ways atypical, as its channel narrows downstream. Also its flow decreases downstream even though average annual rainfall at its mouth is twice that at its head (1,200 mm vs. 600 mm) and its suspended-sediment at El Yacare was about 41 million metric tonnes per year during 1970-73 and 82 million metric tonnes per year at El Colorado. The Rio Pilcomayo 'Superior' disappears near Laguna Escalante, owing to plugging of its channel by sediment, into a network of shallow lakes and marshes. Another stream known as the Rio Pil-

LIBRARY U. OF I. URBANA-CHAMPAIGN

comayo 'Inferior' appears about 160 km to the southeast and meanders downstream to the Rio Paraguay. The Rio Pilcomayo 'Superior' carries about 100 million metric tonnes of sediment per year. The average annual concentration of sediment is more than 6 kg per cubic meter of flow. (Woodard-USGS)

CHEMISTRY OF THERMAL WATERS IN LONG VALLEY, MONO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
L. M. Willey, J. R. O'Neil, and J. B. Rapp.
Open-file report, January 1974. 19 p, 1 fig, 6 tab, 13 ref.

Descriptors: *Geothermal studies, *Thermal water, *Chemical analysis, *Temperature, *California, Data collections, Methodology, Energy, Water chemistry, Geochemistry, Water types, Alkaline water.
Identifiers: Mono County(Calif), Probable energy sources, Geothermometers, *Long Valley(Calif).

Exploration for geothermal energy in the Long Valley area of Mono County, California, the site of a major collapse caldera, began in 1959. Since then the area has been the subject of intensive studies to determine its potential for geothermal power. In 1972, ground waters were sampled to study the hydrogeochemistry of the area, utilizing the most advanced techniques available to insure accurate chemical analysis. The waters are either a sodium bicarbonate or sodium chloride bicarbonate type. Relatively high values for chloride indicate that the thermal waters probably are part of a hot-water rather than a vapor-dominated hydrothermal system. Subsurface temperatures were calculated using six different geochemical methods. (Woodard-USGS)

CONVECTIVE HEAT FLOW FROM HOT SPRINGS IN THE LONG VALLEY CALDERA, MONO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
M. L. Sorey, and R. E. Lewis.
Journal of Geophysical Research, Vol 81, No 5, p 785-791, February 10, 1976. 3 fig, 4 tab, 23 ref.

Descriptors: *Geothermal studies, *Thermal springs, *Water chemistry, *California, Water temperature, Hot springs, Flow rates, Analytical techniques, Geochemistry, Correlation analysis, Heat flow, Boron.
Identifiers: *Long Valley Caldera(Calif).

The heat discharged by the hot spring system in Long Valley, California, has been estimated from measured spring discharges by using geochemical mixing models. Of the total flow of 1300 liter/s from 11 thermal springs in the caldera, approximately 20% or 150 liter/s is contributed by the hydrothermal system at depth with temperatures near 210 C. The effects of heat loss by conductive cooling, mixing, and boiling are quantified for the springs in Hot Creek Gorge, which are the major source of hot water discharge in the caldera. The estimated total convective heat discharge is 4.3 x 10 to the 7th power cal/s, which is in agreement with an estimate obtained from the rate of boron discharge from the caldera into Lake Crowley. (Woodard-USGS)

GEOCHEMISTRY OF THERMAL WATERS IN LONG VALLEY, MONO COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
R. H. Mariner, and L. M. Willey.
Journal of Geophysical Research, Vol 81, No 5, p 792-800, February 10, 1976. 8 fig, 6 tab, 27 ref.

Descriptors: *Geochemistry, *Geothermal studies, *Thermal springs, *Chemical analysis, *Water temperature, Water chemistry, Evaluation, Chemical reactions, Dissolved solids, *California.
Identifiers: Mono County(Calif), *Long Valley(Calif), Geothermometer.

Thermal springs and wells in Long Valley, California, issue sodium bicarbonate-chloride waters containing 1000-1420 mg/liter of dissolved solids. Thermal waters of sodium bicarbonate-chloride composition are usually associated with hot-water reservoirs. Chloride concentrations and stable isotope data indicate that the thermal waters have had varied histories. All of the thermal springs issue a mixture of fluid from the thermal reservoir and less saline, cooler water from one or more shallow aquifers. The composition of springs in Hot Creek Gorge may have been further altered by minor subsurface boiling. Thermal springs between Hot Creek and Lake Crowley issue mixtures of fresh and thermal waters which have lost heat by conductive cooling and changed composition by reaction with rock in the shallow aquifer. The silica content of water from Magma Richie 5 and mixing calculations based on the concentrations of silica in thermal waters collected from springs in Hot Creek Gorge and along Little Hot Creek indicate a temperature of at least 200 degrees C in the thermal reservoir. The sodium-potassium-calcium geothermometer yields a reservoir temperature estimate near 200 degrees C for most of the thermal springs. If geothermal energy is developed in Long Valley, the high concentrations of arsenic (up to 2.2 mg/liter), boron (up to 15 mg/liter), and total dissolved solids in the thermal fluids will make it necessary to isolate the effluent of production wells from the freshwater system. (Woodard-USGS)

FEDERAL RIVERBASIN PLANNING IN THE COASTAL ZONE: THE LONG ISLAND SOUND STUDY,
Yale Univ., New Haven, Conn. School of Forestry and Environmental Studies.
L. C. Irland.
Coastal Zone Management Journal, Vol 2, No 3, p 247-72, 1976. 4 fig, 21 ref.

Descriptors: *Water Resource Planning Act, *Governmental interrelations, *Institutional constraints, *Federal project policy, Interagency cooperation, Administration, Multiple-purpose projects, Water management(Applied), Long term planning, Project planning, Planning, Regional development, Interstate, Federal government, Local governments, State governments, Management.
Identifiers: *Coastal zone management, *Coastal waters, *Long Island Sound Study, Water planning, Coastal zone, Coastal zone planning.

Coastal zone planning has been attempted through a variety of institutional systems. The Long Island Sound Study (LISS) is an important case study in federal water planning in coastal zones because it illustrates the limitations imposed on planning by the traditional multiagency committee format, as well as the weaknesses in traditional planning concepts. The LISS was successful to the extent that it went beyond the traditional water planning process in areas such as local involvement and public participation, but because of the framework of established pattern of riverbasin planning, it was unable to go far enough. The existing riverbasin planning approach needs to be adjusted to adapt to administrative and political realities in the coastal zone. Planning efforts for coastal zone management should emphasize state leadership, since implementation is largely state responsibility. In addition, current approaches of basing plans on projected demands must be abandoned in favor of a system based on description and analysis of alternatives. (Petruff-Florida)

CIRCULATION AND SURGE MODELING IN PAMLICO SOUND, N.C.,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
M. Amein, and D. S. Airan.
Sea Grant Reprint No. 100, Reprinted from: Proceedings of ASCE National Water Resources and Ocean Engineering Convention held San Diego, California, April 5-8, 1976. Preprint No. 2665. 32 p, 12 fig, 3 tab, 12 ref.

Descriptors: *North Carolina, *Ocean circulation, Circulation, Surges, Model studies, Winds, Mathematical models, Hurricanes, Water resources development.
Identifiers: *Pamlico Sound(NC).

Pamlico Sound is a large semi-enclosed body of partially saline water on the coast of North Carolina separated by a narrow strip of barrier islands from the Atlantic Ocean. Freshwater inflow is from two major rivers and from Albemarle Sound. There is tidal flow across the inlets. Wind is a major factor in circulation, and there is considerable surge action during the hurricanes. A numerical model based on the two-dimensional shallow water hydrodynamic equations is used to compute water surface elevations and currents. The model uses an explicit finite difference representation, and includes convective acceleration, and nonlinear surface and bottom stress. The time dependent water movements are computed for an observed hurricane with good success. The model can be used to predict surge heights for coastal protection, and it will provide data for water resource management and for pollution control. (NOAA)

J. A. Dygas, and D. C. Burrell.
Reprinted from: Ocean Engineering, Vol 3, p 317-327, 1976. 9 fig, 14 ref. Also as: Alaska Univ. Inst. Marine Science Contribution No. 281. SG-04-6-158-44039 EPA-R-801124.

Descriptors: *Winds, *Currents(Water), *Arctic Ocean, *Lagoons, *Alaska.
Identifiers: Beaufort Sea(Simpson Lagoon Alas).

The response of wind-drift currents to the prevailing summer wind regime is reported for Simpson Lagoon on the Beaufort Sea (Arctic Ocean) coast of Alaska. Wind and current measurements were taken over the period July 17 to October 20 and August 11 to September 18, 1972, respectively, at a site eastward of the Colville River delta. Mean wind speeds and the frequency of occurrence of westerly storms tend to increase from July to October. Prevailing currents within the lagoon are towards the W to NW driven by the prevailing northeasterly winds. Relatively rapid reversals of current direction occur in response to alternating easterly and westerly winds. Cross correlations of power spectral of the filtered E-W components of the lagoon current record with the concurrent wind data gave a periodicity of 4-5 days at a 70% level of coherence. A linear correlation of -0.83 was obtained between the E-W components of the filtered current record and the wind record, and net water transport (from a progressive current vector analysis) over this period was determined to be towards the WNW with a mean vector velocity of 10.6 cm/sec. (NOAA)

WASSAW ISLAND EROSION STUDY. PART 1: SEDIMENTARY FRAMEWORK OF A CHANNEL MARGIN SHOAL OF AN EBB DELTA, WASSAW SOUND, GEORGIA,
Skidaway Inst. of Oceanography, Savannah, Ga.; and Georgia Marine Science Center, Savannah.
G. F. Oertel.
Sea Grant Technical Report Series No. 77-1, January 1976. 19 p, 9 fig, 7 ref. SG-10-32-RR-273-077.

Descriptors: *Georgia, *Sedimentation, *Spatial distribution, *Sediment distribution, Shoals, Deltas, Coasts, Beach erosion.
Identifiers: Bioturbation, Wassaw Island(Geo).

A detailed description of the sediment carpet on the shoal is given based on the analysis of 36 box cores taken from a 2 x 4 mile grid. The coring device took relatively undisturbed samples that could be analyzed for primary and biogenic sedimentary structures, grain size and textures. The fine and very-fine grained sands on the marginal shoal have low threshold velocities. These well sorted, fine sediments are very susceptible to rapid transit with increases in physical energy. The general lack of secondary mixing in shoal sediments suggests that these sediments undergo continuous reporking and apparently the shoal is in dynamic equilibrium with physical forces. The coarse sediment on the channel margin is a 'lag' deposit and is also in dynamic equilibrium with reversing inlet tidal currents. The offshore area and the area 'shielded' by the shoal have relatively stable sediment carpets and were less susceptible to ambient energy conditions. These relatively stable substrates were periodically reworked by large storm waves. (NOAA)

DUNE STABILIZATION WITH PANICUM AMARUM ALONG THE NORTH CAROLINA COAST,
North Carolina State Univ. at Raleigh. Center for Marine and Coastal Studies.
E. D. Seneca, W. W. Woodhouse, Jr., and S. W. Broome.
Sea Grant Publication No. UNC-SG-77-03, Feb 1977. Reprint of U.S. Army Coastal Engineering Research Center Miscellaneous Rept. No. 76-3, Feb 1976. 42 p, 16 fig, 13 tab, 8 ref. Also as NCSU Rept. 77-1. SG-2-35178, 04-3-158-40. CERC-DACW72-73-C-0025.

Descriptors: *Dunes, *Shore protection, Water resources, *Stabilization, *North Carolina, Grasses, Vegetation, Sedimentation, Bank stabilization, Coasts.
Identifiers: *Panicum amarum, American beachgrass, Sea oats, *Dune stabilization, *Bitter panicum.

Information is presented to assist coastal engineers in dune stabilization by the establishement and development of vegetation. Sand accumulation and profile data suggest that bitter panicum should not be used in monospecific plantings to build dunes along the North Carolina coast. The results indicate that the mixed species planting is almost as good at dune building as monospecific stands of American beachgrass. These mixed species plantings are ecologically more desirable because of the insect, disease, and physiological problems associated with American beachgrass at this latitude. In a mixed species planting of American beachgrass, bitter panicum, and sea oats, a dune can be built primarily by the sand trapping potentials of American beachgrass and sea oats; when American beachgrass begins dying out, it can rapidly be replaced by the other two native grasses to stabilize the area. The principal values of bitter panicum are in stabilizing sand coastal areas and in mixed species plantings to build and stabilize coastal dunes in the southeastern United States. (NOAA)

HYDROGRAPHIC PROPERTIES, MESA NEW YORK BIGHT ATLAS MONOGRAPH 1,
New York Sea Grant Inst., Albany,
M. J. Bowman, and L. D. Wunderlich.
Report NYSSGP-AM-77-002, February 1977. 78 p, 14 fig, 2 tab, 105 ref, 13 maps. SG-2-35281 and ONR-00014-68-C-0298.

Descriptors: Hydrography, *Continental shelf, Water properties, Seasonal, *Salinity, *Temperature, New York, *Hydrologic properties, *Density, Environment, Maps.
Identifiers: Environmental conditions, *Seasonal variations, *New York Bight, *Middle Atlantic Bight, Oceanographic data.

Cycles of temperature, salinity, and density characteristic of the Middle Atlantic Bight, which includes New York Bight, are determined by seasonal patterns of insolation, river runoff, evaporation minus precipitation, winds, ocean currents, and shelf/slope exchange processes. Shelf temperatures have a large annual nearshore range around 25 degree C; the water column is unstratified in winter but is dominated by a strong thermocline in summer. A cool pool of bottom shelf water on the middle and outer continental shelf remains during the summer as a remnant of the previous winter and persists throughout the entire Middle Atlantic Bight. EFFECT OF THE ASWAN HIGH DAM ON THE NILE FLOOD AND ON THE ESTUARINE AND COASTAL CIRCULATION PATTERN ALONG THE MEDITERRANEAN EGYPTIAN COAST,
Alexandria Univ. (Egypt). Dept. of Oceanography.
S. H. Sharaf El Din.

Limnology and Oceanography, Vol 22, No 2, p 194-207, March 1977. 17 fig, 24 ref.

Descriptors: *Dams, *Floods, *Estuaries, *Circulation, Estuarine environment, Hydrography, Biological communities, Nutrients, Flood flow, Foreign research, Foreign countries, *Sediment transport.
Identifiers: *Aswan High Dam, *Nile River, *Egyptian coast, *Mediterranean Sea, *Levantine Sea, Biological economy, Nutrient budget, Flood season.

From 60-180 million tons of sediments and 18 x 10 to the 9th power to 55 x 10 to the 9th power cu m of water were transported to the Mediterranean Sea by the Nile annually before the Aswan High Dam was erected in 1964. Before completion of the dam, during the flood period the estuarine circulation pattern was a two-layer flow at the mouth of the two estuaries. In winter, the circulation pattern was a one-layer flow of seawater; this pattern had persisted during most of the year since 1964. The velocity of the currents at the mouth of the Nile branches reached more than 4 knots at the surface but was less than 0.5 knot at the bottom during the flood period before 1964. After 1964, the velocity dropped considerably. General oceanographic conditions in the offshore region beyond the continental shelf did not change noticeably, but hydrographic conditions over the continental shelf in front of the delta showed considerable change after 1964. Also, since 1964 almost no sediment has been discharged from the Nile. As a result, an imbalance in the near-coast sediment budget was produced which increased erosion at the two mouths of the river and caused a shift of the sediments along the coast. (Roberts-ISWS)

THE RESPONSE OF AN ESTUARY TO THE CLOSURE OF A MOBILE BARRIER; RICHMOND BARRIER ON THE UPPER THAMES ESTUARY,
Institute of Oceanographic Sciences, Birkenhead (England).
A. J. Bowen, and S. J. Pinless.
Estuarine and Coastal Marine Science, Vol 5, No 2, p 197-208, March 1977. 7 fig, 1 tab, 5 ref.

Descriptors: *Estuaries, *Barriers, *Mathematical models, Foreign research, Foreign countries, Tides, Tidal effects, Hydraulic models, Numerical analysis, Estuarine environment, Model studies.
Identifiers: *Mobile barrier, Richmond barrier, *Thames Estuary, Woolwich barrier, Tidal regime, Tidal gages, Estuarine motion.

A detailed, one-dimensional, numerical model of the Thames Estuary above Chelsea was developed to examine the dynamics of this complex region, a region which has been represented crudely in previous models of the whole estuary. The model was found to describe accurately the tidal regime in this area, correctly reproducing the effect of a mobile barrier closing across the tide. Opportunities for verification of predicted changes due to major alteration in the geometry of the system were rare, usually being possible only in a follow-up study after a new structure has been completed. The half-tide barrier at Richmond was used to check predictions against direct observations. The Thames Flood Prevention Investigation, commissioned by the Greater London Council, supported the project which was to evaluate changes in the tidal regime and extreme levels in the River Thames resulting from the closure of the Woolwich Barrier. (Roberts-ISWS)

THE STABILITY DURING MANY YEARS OF THE MID-TIDAL SHORE AT PENRHYN BAY, NORTH WALES, AND A NOTE ON THE PEAT BEDS AT RHOS-ON-SEA,
Marine Biological Association of the United Kingdom, Plymouth (England). Plymouth Lab.
D. P. Wilson.
Estuarine and Coastal Marine Science, Vol 5, No 2, p 209-213, March 1977. 3 plate, 10 ref.

Descriptors: *Peat, *Stability, *Tides, Shores, Shoreline cover, Topography, Storms, Boulders, Erosion, Photography, Rocks, Bays.
Identifiers: *Penrhyn Bay, *North Wales, *Rhos-on-Sea, Mid-tidal shore, Photographs, Mid-tidal area, Cliffs.

It was shown that the shore level at Penrhyn Bay, North Wales, seaward of the shingle slope at the foot of the promenade wall had not changed appreciably for over 50 years. Previously published material contradicted this statement, but the statement is substantiated not only by reference to old photographs, but also by personal knowledge of the author. The shore and its major structures, natural and man-made, have remained virtually unchanged since almost 60 years ago. Storms have little effect on the almost level boulder-strewn, mid-tidal area. Except for human interference, there is no reason to anticipate any major change in the topography for many years in the future. Similarly, peat beds at Rhos-on-Sea, reported to have long since been lost by erosion, still exist. (Roberts-ISWS)

DAY DEGREE GROWTH MODELS FOR INTERTIDAL OYSTERS,
South Carolina Univ., Georgetown. Belle W. Baruch Inst. for Marine Biology and Coastal Research.
R. F. Dame.
Contribution in Marine Science, Vol 19, 1975, p 107-112, 2 fig, 2 tab, 17 ref.

Descriptors: *Mathematical models, *Forecasting, *Growth rates, *Oysters, Intertidaal areas.
Identifiers: Day degree growth models.

Data are presented which show linear and polynomial day degree models to be capable of predicting oyster growth in terms of height or weight. Linear day degree models utilizing whole weight observations explain at least 94% of the variability in the seasonal growth of intertidal oysters, but fail to accurately describe all the fluctuation in growth rate. Growth data from observation utilizing shell height measurements did not fit either the linear not the quadratic day degree models as well as the whole weight observations. Quadratic day degree models offered an increase in the accuracy of prediction for the observed data, but gave completely erroneous predictions of growth if extended to future years without new data. The coefficients of the quadratic or polynomial models have not as yet been shown to have any biological meaning. (Chilton-ORNL)

INSTABILITY IN TIDAL FLOW COMPUTATIONAL SCHEMES,
Hydraulics Research Station, Wallingford (England).
T. J. Weare.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. HY5, Proceedings paper No. 12100, p 569-580, May 1976. 6 fig, 3 ref.

Descriptors: *Hydraulics, *Tidal waters, *Numerical analysis, *Mathematical models, Tides, *Stability, Equations, Systems analysis.
Identifiers: *Finite difference theory, Tidal currents.

A careful analysis of the multioperational finite difference schemes proposed by Leendertse reveals a nonlinear numerical instability. This instability arises from the imperfect time centering of certain nonlinear terms in the shallow water equations. For many applications, the natural damping due to the friction term controls or masks the instability. The results of the stability analysis suggest that the instability becomes uncontrollable when a small grid spacing is used. These conclusions are confirmed by numerical experiment. (Bell-Cornell)

SUBJECT KEYWORD LIST, (ESTUARINE AND COASTAL MARINE SCIENCE),
Estuarine and Coastal Marine Science, Vol. 5, No. 2, p 1-34, March 1977.

Descriptors: *Information retrieval, *Estuaries, *Estuarine environment, *Indexing, Information exchange, Documentation, Publications, *Thesauri, Abstracts, Coasts, Classification.
Identifiers: *Glossaries, Subject keyword list.

A list was tabulated of 7800 subject keywords which will be used in the future to define the subject matter of papers published in Estuarine and Coastal Marine Science (ECMS), and to compile an annual index. The abstract of each paper will be preceeded by up to 8 Keywords chosen by the author to define the paper. These Keywords can then be used by librarians indexing papers; by readers searching for literature on a given subject; or in computerized information retrieval systems. The efficient allocation of Keywords to papers should increase the potential readership of all papers in the Journal. The ECMS list was compiled from the following sources; (1) Oceanic Abstracts, word list (1976); (2) FAO Aquatic Sciences and Fisheries draft list of permitted Keywords (1976); (3) Illiffe Science and Technology, Underwater Bulletin; (4) Subject heads from 'Encyclopaedia of Beaches and Coasts', edited by M. Schwartz; (5) Wordlist submitted by Estuarine and Brackish-Water Sciences Association; (6) US Army Beach Erosion Board, Glossary of Terms (1973); (7) Commercial Oceanology Study Group, word list (1965); and (8) Index from 'Estuaries', by K. R. Dyer. Every Keyword on the ECMS list has a 4-letter code preceeding it so that its source can be identified when matching other index systems. Where a Keyword occurs in several lists, the code indicates the largest list in which it occurs. The ECMS Keyword List is not a fully structured list, and it is not backed by a structured Thesaurus. The decision to publish and use the ECMS list in its present form was made because of the urgent need for a finite list of some kind. (Humphreys-ISWS)

BRACE RESEARCH INSTITUTE, ANNUAL REPORT, (1976),
Macdonald Coll. Montreal (Quebec). Brace Research Inst.
T. A. Lawand, and G. L. d'Ombrain.
Annual Report No. M32, August 1976. 53 p, 44 photo, 10 dwg.

Descriptors: *Research and development, *Energy, *Solar radiation, *Winds, Saline water, Desalination, Universities, Agriculture, Energy conservation, Energy budget, Irrigation water, Irrigation, Water quality, Irrigation engineering, Deserts, Arid climates, Arid lands, Tropical regions, Africa, Foreign countries, Canada, Geographical regions.
Identifiers: Solar energy.

The Brace Research Institute of McGill University concentrates its research on eliminating the salt content of sea water so that it may be used for irrigation, and on developing methods for making

desert or arid land available for agricultural purposes. The institute's annual report discusses its myriad research and development activities. For example, the principal thrust of the institute's overseas sector in the past year has been their role in the establishment of a Rural Energy Centre utilizing renewable energy resources in Senegal. The institute undertook a study on the possibility of meeting the village's basic energy requirements for cooking, some lighting, and water supply pumping through solar, wind, and biogas energies. Negotiations are pending with other underdeveloped countries for a program of similar activities. Due to its unique expertise in both solar and wind energy, and saline water conversion, the institute has played a major role as a consultant in the field of international technical collaboration. The institute disseminated a considerable number of do-it-yourself leaflets, plans and specifications of simple equipment for the conversion of natural energies to useful purposes. The institute also participated in the United Nations Habitat Conference, and demonstrated its new version of a solar steam cooker. (Moorhouse-Florida)

Descriptors: *Weather modification, *Cloud seeding, *Precipitation(Atmospheric), Cloud physics, Climatology, Evaluation, Artificial precipitation, Rain, Rainfall, Snow, Silver iodide, Storm structure, Storms, Clouds, Weather, Meteorology, Reviews.

There are many contrasting views on the success of experiments with weather modification. This paper reviewed a large number of studies, commencing with a summary of some of the pertinent problems in cloud physics and those leading to cloud modification. The report dealt with the techniques of modification such as the use of dry ice and silver iodide and gave details of the results of experiments with clouds of different types. The conclusion reached was that the result of methods of modification used at present are not sufficiently predictable to warrant their use commercially and that the results of most of the interesting studies have not been evaluated by sufficiently reliable methods. (Sims-ISWS)

FINAL REPORT ON THE PYRAMID LAKE PILOT PROJECT, 1970-1975, VOLUME 1, TEXT OF REPORT,
Nevada Univ. System, Reno. Lab. of Atmospheric Physics.
January 1977, 251 p. Edited by Patrick Squires. Bur Reclam 14-06-D-7000.

Descriptors: Atmospheric physics, Climates, Cloud physics, *Cloud seeding, Meteorology, *Weather modification, Silver iodide, *Nevada, California, *Precipitation(Atmospheric), Data collections, Instrumentation, Measurement, Networks.
Identifiers: Truckee River, *Pyramid Lake project.

A randomized cloud seeding project was carried out over an area of 1052 sq. mi. near Lake Tahoe for 3 winter-spring seasons. Six remotely controlled silver iodide generators were located on the upper western slopes of the Sierra Nevada, and precipitation was measured by means of 23 recording gauges and 54 non-recording gauges. A total of 132 experimental periods (corresponding to forecast synoptic scale storms) averaged some 35 hours in duration. The preliminary statistical analysis is based on a comparison of periods randomly assigned to be seeded, or not seeded, on a 50-50 basis. However, for a variety of reasons, seeding actually occurred for only about half the total hours assigned to be seeded. Thus, the effect of seeding can appear here only in a somewhat diluted form. The varying duration of experimental periods was taken into account by assuming a Gamma distribution of precipitation amounts, with the shape parameter a linear function of duration; the effect of seeding then appeared as a change in the scale parameter. By means of a forecast, storms were classified as heavy, moderate, light or marginal. The evidence for a positive seeding effect is not conclusive; however, the apparent effect or seeding all categories of storms was an increase of 16%. In the group comprising heavy and moderate storms, the apparent increase was 25%. If the true effect had been equal to this, the chance of detecting it, at the 5% significance level, would have been about 1 in 5. (See also W77-07567) (Bur Reclam)

Identifiers: Sorghum-Dochna.

Because of decreasing freshwater supplies, it was considered important to examine effects of using water with higher salt levels in irrigation. The plants were grown in hothouse conditions and varying amounts of NaCl were supplied. A dose of 6 meq/l was beneficial to plant growth. Stronger doses retarded growth, however. Large amounts of sodium accumulated in the roots, while C concentrations were higher in aerial parts, espcially the leaves. Levels of these elements in various plants parts was always related to the amount of NaCl in the nutrient solution.--Copyright 1977, Biological Abstracts, Inc.

GEOTHERMAL POWER, THE 'SLEEPER' IN THE ENERGY RACE,
Magma-Thermal Power Project, Santa Rosa, Calif.
R. Lengquist, and F. Hirschfeld.
Mechanical Engineering, Vol. 98, No. 12, p 25-31, December, 1976.

Descriptors: *Geothermal studies, *Thermal powerplants, *Energy conversion, *Electric power production, Thermal water, Hot springs, Turbines, Generators, Electric power costs, Corrosion, Environmental effects, Hydrogen sulfide, California.
Identifiers: The Geysers Geothermal Power Plant, Pacific Gas and Electric Company, Sonoma County(California).

Although geologic understanding of geothermal energy is still in relative infancy, potential for the expanded use of this valuable resource is great, as is demonstrated by the Geysers Geothermal Power Plant in Sonoma County, California. Once a popular health resort, the Geysers area has undergone extensive development by private enterprise. The present electric plant has an installed capacity of 522 MW, with projected expansion to 1000 MW by 1980. Individual generating units of up to 110 MW are now in operation, with even larger units in the planning stages. Use of natural steam and the consequent elimination of boilers are the key factors in making the Geysers plant such an economical and simple operation. Both capital costs and operating costs compare favorably with those of installations fueled by other means, and it is estimated that the Geysers has saved 25 million bbl of fuel oil since 1960. Some environmental problems, notably H2S gas and well noise, have been encountered and largely corrected. Corrosion effects of the H2S are avoided by substituting aluminum, stainless steel, cast iron, and epoxy-coated asbestos cement for copper in piping and condenser lines and hardware. (Eberle-NWWA)

PROTEIN PRODUCTION BY RUSSIAN THISTLE: EFFECTS OF WATER AND NITROGEN ON PROTEIN YIELDS,
New Mexico State Univ., University Park. Dept. of Chemistry.
J. H. Hageman, and J. L. Fowler.
Available from the National Technical Information Service, Springfield, VA, 22161 as PB-266 709, Price codes: A02 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, Las Couces. Report No. 085, March 1977. 17 p, 14 tab, 9 ref. OWRT A-049-NMEX(2). 14-34-0001-6032.

Descriptors: *Forages, *Weeds, Plant growth, *Proteins, *Water requirements, Irrigation effects, Nutrient requirements, *Drought resistance, Productivity, Vegetation establishment, Nitrogen, Salt tolerance, *Nitrates, Crop production, New Mexico.
Identifiers: *Russian thistle, Salsola, Protein content, Water use efficiency.

The purpose was to determine whether Russian thistle (Salsola spp.) might have potential as either a protein source or a forage under conditions of restricted water. Salsola was chosen because it was reported to be a C4 plant which is efficient in water use, drought resistant, salt tolerant and because it had been used as a feed previously. In two seasons of field cultivation the following results were obtaind: (1) average percentage protein contents are 16% (range: 23-8.5%); (2) the protein is very well balanced with regard to amino acid content; (3) at water and nitrogen levels which provide maximal yields the nitrate content does not exceed 0.6% of dry weight; (4) the average percentage of crude fiber content (acid detergent fiber-acid detergent lignin) is 23% (range: 27%-16%); (5) average yield of above-ground dry matter for 1975, overall water and nitrogen treatments, was 7781 kg/ha; (6) the same yield figure for 1976 was 8645 kg/ha; (7) under optimal treatments yields greater than 10,000 kg/ha were obtained; and (8) with 35 cm total applied water and 112 kg/ha of nitrogen, conditions giving optimal yields, water use efficiency was 329 g water/g above-ground dry matter. These results compare favorably with alfalfa, which is the most widely grown forage in New Mexico. (Stockton- NMex State)

REDUCING POWER CONSUMPTION IN IRRIGATION SYSTEMS WITH THE AID OF A MATHEMATICAL MODEL FOR PIPE DIMENSIONING,
Academia de Studii Economice, Bucharest (Rumania). Dept. of Economic Cybernetics.
U. Berar, V. Ionescu, and R. Marinescu.
In: Economic Computation and Economic Cybernetic Studies and Research, No. 4, p 55-68, 1974. (Published in Rumania) 6 fig, 5 ref.

Descriptors: *Irrigation systems, *Pipes, *Optimization, Water supply, Pumping, Electric power, Flow, Pressure, Costs, Hydraulics, Dimensions, Computer models, Computer programs, Investment, Simulation analysis, Equations, Systems analysis.
Identifiers: Cost minimization, Sizing, Power minimization, Power consumption, Pipe diameter, Economic effects.

Presented is a mathematical model for the sizing of irrigation pipes (called antennae) by considering the simulation of the functioning conditions specific to these pipes. Calculated is the dimensioning of the antennae under real topographic conditions and under the conditions of flow and pressure characteristic of each case taken separately in the irrigation system. Derived is a solution for minimizing power and materials costs. The objective function is represented by the minimization of investments in the pipe and of costs of power to dissipate at some hydrants by eliminating to the maximum the use of pressure and/or flow limiters. The model allows the choice of diameters and materials after interchangeable catalogues. The calculus hypotheses taken into consideration are the same as in the case of the classical calculus, but laboratory research is also necessary for determining some possible minor phenomena yet unknown. Identifiers: *Sahel(Africa), *Congo(Africa).

The management of water resources requires knowledge of the spatial and temporal distribution of surface and groundwater resources and an assessment of the influence of man on the hydrological regime. For small water courses, regional estimates can be made from representative basins which offer guidelines (1) for the computation of mean annual flow and in some cases for the determination of the statistical distribution of the annual flows; and (2) for the computation of the 10-yr flood maximum discharge and volume. An example concerning the tropical African Sahel was given. From a general study of the daily precipitation, a simple rainfall/runoff model used on a daily basis and calibrated on data from representative basins, and the direct comparison of results from 55 representative basins, statistical distribution curves were established for annual runoff based on mean annual precipitation and the geomorphological characteristics of the basins. Another example concerning tropical Africa west of Congo presented a methodology for the computation of the 10-yr flood (maximum discharge and volume). The systematic study of 60 representative basins makes it possible to plot the runoff coefficient R/P as a function of basin climate, mean slope, and soil permeability. Other curves are used to determine the time of rise and the base time of the hydrograph as a function of the basin area and the mean slope. The experimental basin is a good tool for the assessment of the influence of man on hydrological parameters. An example showed the influence of land use on the regression between annual precipitation and annual runoff. (Sims-ISWS)

Descriptors: *Flood forecasting, *Flow characteristics, *Peak discharge, *Channel morphology, *Wyoming, Analytical techniques, River basins, Streamflow, Flow rates, Flood data, Historic floods, Regression analysis.

This report presents relations for estimating peak flows and mean annual flow characteristics are: (1) The Channel-geometry method, whereby flow characteristics are related to channel dimensions; and (2) the basin-characteristics method, whereby flow characteristics are related to physiographic and climatic features of the drainage basin. Development of the channel-geometry method showed channel width to be the most significant channel dimension for estimating flow characteristics. Use of this method requires a field measurement of channel width. Development of the basin-characteristics method showed drainage-area size to be the most significant basin feature for estimating streamflow. In the mountainous areas, basin elevation also affect streamflow. Because these basin features can be determined from maps, this method does not require a visit to the site. (Woodard-USGS)

EVALUATION OF FLOOD FORECASTING-RESPONSE SYSTEMS,
Princeton Univ., N.J. Dept. of Civil Engineering.
M. Sniedovich, and D. R. Davis.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 103, No. WR1, Proceedings Paper No. 12937, p 83-97, May 1977. 1 fig, 5 tab, 19 ref.

Descriptors: *Flood forecasting, *Flood damage, *Warning systems, *Systems analysis, *Evaluation, Decision making, Efficiency, Responses, Rivers, Probability, Optimization, Forecasting, Measurement, Equations, Mathematical models.
Identifiers: *Decision theory, Probability theory.

When the objective of operating a flood forecasting-response system is to reduce damage caused by flooding, rather than to provide 'accurate and timely' flood forecasts, improvements and changes to the system must be evaluated considering all components of the system and their interactions. For this purpose, a methodology is presented which considers the following components of the system: (1) the hydrometric system; (2) the forecasting model; (3) the dissemination system; and (4) the decision model used by the floodplain dweller and his protective system. Quantification is accomplished by a mathematical model that enables flood forecasing systems to be evaluated on the basis of expected reduction in damage due to the use of the system. Uncertainties in the forecast are handled in a decision theoretic manner that enables the calculation of an optimal response to a forecast. Comparison of optimal and nonoptimal responses illustrates the importance of considering the response when examining the effectiveness of flood forecasts. (Bell-Cornell)

PUMPED STORAGE OPTIMIZATION IN GENERATION SYSTEMS,
Natal Univ., Durban(South Africa). Dept. of Civil Engineering.
J. S. Windsor.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 103, No. WR1, Proceedings paper No. 12946, p 99-109, May 1977. 4 fig, 8 ref.

Descriptors: *Pumped storage, *Powerplants, *Optimization, *Electric power production, Economic efficiency, Computer programs, Water resources, Equations, Mathematical models, Operations research, Planning.
Identifiers: Cost minimization, Systems engineering, Economic analysis, *Mixed integer programming.

Presented is a methodology which has particular reference to the integration of pumped-storage schemes into expanding electric-power systems. The model is based on an interpretation of the transshipment problem, and employs mixed integer programming to determine the minimum cost strategy for future investments and operating costs. The advantage of this approach is that it explicitly recognizes the system as consisting of a set of interacting subsystems which are coupled in space and time and which are operated under a single management unit. It also accounts for the economies of scale associated with the cost of building and operating the electric power facilities.(Bell-Cornell)

Water Resources Research, Vol. 13, No. 2, p 239-245, April 1977. 5 fig, 2 tab, 9 ref, 1 appen.

Descriptors: *Water resources, *Reservoir operation, *Safe yield, Water supply, Costs, Design, Simulation analysis, Methodology, Optimization, Flow, Stochastic processes, Operations research, Equations, Mathematical models.
Identifiers: *Synergism, *Joint operation, *Operating rule, Cost minimization, LaGrange multiplier, Sizing.

Synergistic gains are defined as the gains in benefits due to joint operation of a system of reservoirs in excess of the benefits from optmal individual operation. These gains are a result of both the deterministic (regional) and the stochastic diversity of flows into each of the reservoirs. They are captured by the use of flexible reservoir operating rules which base release decisions for a given reservoir on the state of the entire system not just on the state of that reservoir. Discussed are safe yield of independently operated reservoirs and of a system of jointly operated reservoirs using simulation. One possible operating rule is formulated and is demonstrated to be highly effective in capturing synergistic gains. A hypothetical design problem of sizing three water supply reservoirs in parallel at least cost is solved by three methods. The first method, using LaGrange multipliers, assumes that no synergistic gains are achievable. The second and third methods recognize the existence of such gains. The method recommended here incorporates the operating rule into the design process and makes use of the observation that the system yield is a function of system capacity. (Bell-Cornell)

RELIABILITY-CONSTRAINED DYNAMIC PROGRAMING AND RANDOMIZED RELEASE RULES IN RESERVOIR MANAGEMENT,
Worcester Polytechnic Inst., Mass. Dept. Civil Engineering.
L. A. Rossman.
Water Resources Research, Vol. 13, No. 2, p 247-255, April 1977. 2 fig, 5 tab, 20 ref.

Descriptors: *Reservoir operation, *Reservoir releases, *Stochastic processes, *Dynamic programming, Management, Reliability, Constraints, Optimization, Benefits, Methodology, Water policy, Reservoir storage, Annual, Probability, Equations, Model studies, Systems analysis.
Identifiers: Benefit maximization, Lagrangian duality theory, Release rules, Branch and bound procedure, Chance-constrained dynamic programming, Duality gaps.

A stochastic dynamic programming model for determining reservoir release rules which maximize expected net benefits subject to reliability constraints on system performance is presented within the framework of Lagrangian duality theory. The approach characterizes optimal release rules under discounting of benefits and being nonstationary. It also indicates when there exists a randomized rule which dominates the optimal deterministic rule. The methodology for obtaining these rules uses dual optimization to provide bounds on the optimal solution and a branch and bound procedure to resolve any duality gap which may occur if the bounds are not equal. The model is applied to a group of hypothetical

problems for which nonoptimal policies had previously been found by using chance-constrained dynamic programming. The approach presented is applicable to problems with several reliability constraints which limit the expected number of occurrences of chance events over the life of the system. (Bell-Cornell)

RESERVOIR OPERATION UNDER CONFLICTING OBJECTIVES,
Politecnico di Milano (Italy). Instituto di Elettrotecnica ed Elettronica.
G. Fronza, A. Karlin, and S. Rinaldi.
Water Resources Research, Vol. 13, No. 2, p 296-302, April 1977. 5 fig, 4 tab, 27 ref.

Descriptors: *Reservoir operation, *Multiple-purpose reservoirs, *Optimization, *Decision making, Simulation analysis, Lakes, Algorithms, Monthly, Economics, Equations, Mathematical models, Systems analysis.
Identifiers: *Game theory, Conflicting objectives, Operating rules, Benefit maximization.

The problem of determining the optimal operation of a monthly regulated two-purpose reservoir is discussed. A basic assumption is made about the decision-making structure of the system in the sense that the operation is not assumed to result from a supervisor's choice but from the users' trade-off. The solution to the problem is found using a game theory approach in both the noncooperative and the cooperative situations. In both cases, under reasonble additional hypotheses about the economic context of the system it is possible to find a solution to the game. Such a solution can be found by means of an efficient search algorithm to be run easily on a computer. Discussed first are the decision variables, the assumptions about the economy, and the decision-making structure of the system. Considered next is the problem solution; the shapes of the feasible regions of the optimization problems presented are examined, and both the noncooperative case and the cooperative case are considered. Summarized are the results of a simulation carried out with data taken from the Lake Maggiore system in northern Italy. A basic criticism is made of use of the game theory approach to solve the problem of operating a reservoir in the presence of two decision makers. The game theory postulates a 'rational behavior' of the players as well as the existence of an accepted or imposed bargain rule. (Bell-Cornell)

Journal of the Irrigation and Drainage Division, Proceedings of the Society of American Civil Engineers, Vol. 102, No. IR2, Proceedings paper No. 12199, p 221-238, June 1976. 14 fig, 19 ref.

Descriptors: *Drains, *Drainage, *Unsaturated flow, *Groundwater, Porosity, Equations, Numerical analysis, Effects, Design, Drawdown, *Saturated flow.
Identifiers: Field investigations, Transient flow, Richards equation, Boussinesq equation.

Richards equation for transient two-dimensional flow during drainage was solved using numerical methods and the solutions compared to solutions of the more approximate Boussinesq equation. The effect of field variability of the soil properties on solutions to the Richards equation was also examined. For the cases studied, the hydraulic head distributions predicted by the Richards equation were in general agreement with the D-F assumptions except for times near t = 0. Convergence near drainage ditches is more critical immediately after drainage begins than for latter times. It results in a surface of seepage for ditches and water standing over the drain for drain tubes. When convergence near the drain is accounted for, solutions to the Boussinesq equation can be used to adequately predict drawdown for design purposes. Unless enough measurements are made to define field-effective values of the unsaturated soil-water properties, there is little to be gained by solving the Richards equation rather than using simpler approximate methods for drawdown prediction. (Bell-Cornell)

SOLUTIONS TO GREEN-AMPT INFILTRATION EQUATION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R-M. Li, M. A. Stevens, and D. B. Simons.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. IR2, Proceedings paper No. 12196, p 239-248, June 1976. 1 fig, 1 tab, 14 ref.

Descriptors: *Irrigation, *Surface waters, *Approximation method, Hydrology, Flow, *Infiltration, Mathematics, Nonlinear differential equations, Darcys Law.
Identifiers: Nonlinear differential equations, Errors.

The simple method of solving the Green-Ampt one-dimensional infiltration equations developed from Darcy's law are proposed for practical applications. The explicit solution is an approximation obtained by employing a power series expansion of the logarithmic term. The maximum error resulting from applying this simple explicit solution is 8%. The implicit 'exact' solution is obtained by refining the explicit solution using the second-order Newton method. The maximum error resulting from employing the implicit solution is 0.003%. These new methods have advantages over other existing solutions in that they are derived from the theory of mathematics and the errors due to approximation can be evaluated theoretically. Moreover, the two methods are simple and easy to use either with a desk calculator or in a digital computer, and they are applicable without limitation on ranges. (Bell-Cornell)

GEOTHERMAL SYSTEMS AND POWER DEVELOPMENT,
Department of Scientific and Industrial Research, Auckland (New Zealand).
A. J. Ellis.
American Scientist, Vol. 190, No. 5, p 510-521, September, 1975. 6 fig, 2 tab, 43 ref.

Descriptors: *Geothermal studies, *Thermal power, *Electric power generation, Geysers, Hot springs, Convection, Steam, Dissolved solids, Brines, Environmental effects, Brine disposal, Remote sensing.
Identifiers: Crustal plate divergence, Crustal plate subduction.

Although hot springs are found throughout the world, geothermal systems with water temperatures above 100 degrees C within 1-2 km of the surface are limited to scattered areas, generally areas of crustal plate divergence or subduction. Geothermal water and steam vary greatly throughout the world with respect to temperature and proportion of dissolved solids and gases. Aerial infrared surveys, geochemical analysis, and electrical resistivity surveys are useful techniques for assessing and delineating geothermal fields, while test drilling remains the only real check of actual production capabilities. Only a few large geothermal power stations exist today, most of which operate in fields with temperatures exceeding 220 degrees C. Relative inefficiency of geothermal energy conversion and problems with disposal of spent effluent brines make it unlikely that developed countries will make extensive use of this resource in the future, although developing countries in the Pacific Basin and in Latin America will probably find it invaluable. Future applications of downhole heat exchange equipment will alleviate much of the disposal problem. A few unusual and highly efficient industrial uses of geothermal sources in New Zealand and Iceland combine power generation with direct steam or hot water utilization of the waste fraction. (Eberle-NWWA)

PHYSICAL MODELING OF COMBINED FORCED AND NATURAL CONVECTION IN WET GEOTHERMAL FORMATIONS,
California Univ., Berkeley. Lawrence Berkeley Lab.
V. E. Schrock, and A. D. K. Laird.
ASME Journal of Heat Transfer, Vol. 98, No. 2, p 213-220, May, 1976. 12 fig, 17 ref, append.

Descriptors: *Geothermal studies, *Heat flow, *Convection, Water circulation, Water temperature, Energy transfer, Thermal water, Thermal power, Porous media, Injection, Groundwater recharge, *Model studies.
Identifiers: *Wet geothermal systems.

Wet geothermal formations or reservoirs are of great current interest as a new energy source. Because of very high concentrations of dissolved solids in most geothermal waters, reinjection of geothermal water after energy has been extracted will be practiced in many cases. Optimum locations of producing and injection wells can only be determined with a knowledge of heat and mass flow within the reservoir. In this study, experiments were performed on the combined effects of forced and natural convection in a liquid-saturated porous medium in a system intended to simulate a wet geothermal system. Flow patterns inferred by temperature field measurements reveal a natural convection effect that develops slowly and is most pronounced when the source flow is low and the temperature difference is large. Results will be useful as a first step toward developing the capability to physically model wet geothermal systems. (Eberle-NWWA)

ASSESSMENT OF GEOTHERMAL RESOURCES OF THE UNITED STATES--1975.
Geological Survey, El Paso, Tex.; and Geologic Survey, Albany, N.Y. Water Resources Div.
Available from U S Geological Survey, Reston VA 22092. Circular 726, 1975. 155 p, 16 fig, 28 tab, 6 ref, append. D. F. White and D. L. Williams, Editors.

Descriptors: *Geothermal studies, *Thermal springs, *Steam, *Energy transfer, *Electric power, Convection, Hydrogeology, Heat flow, Thermal properties, Evaluation, Supply, *United States.
Identifiers: *Geothermal energy, *Geothermal resources(USA).

This assessment of geothermal resources of the United States consists of two major parts: (1) estimates of total heat in the ground to a depth of 1 km and (2) estimates of the part of this total heat that is recoverable with present technology, regardless of price. No attempt has been made to consider most aspects of the legal, environmental and institutional limitations in exploiting these resouces. In general, the average heat content of rocks is considerably higher in the Western United

States than in the East. This also helps to explain why the most favorable hydrothermal convection systems and the hot young igneous systems occur in the West. Resources of the most attractive identified convection systems (excluding national parks) with predicted reservoir temperatures above 150 deg C have an estimated electrical production potential of about 8,000 megawatt century, or about 26,000 megawatt for 30 years. Assumptions in this conversion are: (1) one-half of the volume of the heat reservoirs is porous and permeable, (2) one-half of the heat of the porous, permeable parts is recoverable in fluids at the wellheads, and (3) the conversion efficiency of heat in wellhead fluids to electricity ranges from about 8 to 20 percent, depending on temperature and kind of fluid (hot water or steam). The estimated overall efficiency of conversion of heat in the ground to electrical energy generally ranges from less than 2 to 5 percent, depending on type of system and reservoir temperature. (See also W77-07477) (Woodard-USGS)
W77-07476

GEOTHERMAL RESOURCES, A NEW LOOK,
A. L. Hammond.
Science, Vol. 190, No. 4212, p 370, October 24, 1975.

Descriptors: *Thermal power, *Electric power production, *Geothermal studies, Thermal water.
Identifiers: Magma chambers, Geopressured zones.

A recent assessment by the USGS (Circular 726) (See W77-07476) underlines how limited current use of geothermal energy potential is in this country. The report provides conservative estimates to the effect that an electric generating capacity of 12000 megawatts, 15 times the current U.S. output from geothermal sources, could be achieved at present energy prices and with current technology. Nearly 10 times that resource either remains to be discovered or awaits improved technology for its exploitation. Main interest at present is in geothermal deposits in which heat is transferred by hydrothermal convection. As with mineral resources, much geothermal heat seems to concentrate in a few large deposits, with some particularly outstanding areas located in California, New Mexico, and the Bruneau-Grandview area of Idaho. Geologically recent magma chambers and the geopressured zone of the Texas-Louisiana gulf area hold promise for the future as drilling and well technology advance with respect to tapping high temperature and high pressure sources, and as energy prices increase. MAJOR AQUIFERS IN DEUEL AND HAMLIN COUNTIES, SOUTH DAKOTA,
Geological Survey, Vermillion, S. Dak. Water Resources Div.
J. Kume.
South Dakota Geological Survey, Vermillion, Information Pamphlet No 11, 1976. 4 p, 5 fig.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, Water wells, Water yield, Pumping, Water utilization, Aquifer systems, *South Dakota.
Identifiers: Deuel and Hamlin Counties(S Dak).

Four major glacial sand and gravel outwash aquifers underlie about 50 square miles, are generally less than 20 feet and may yield from 50 to 150 gallons per minute (gpm) to domestic, stock, and public-supply wells. The water in the aquifer is fresh and a calcium bicarbonate type. The Big Sioux aquifer underlies about 180 square miles, averages about 30 feet in thickness, and may yield as much as 1,000 gpm to domestic, stock, irrigation, and public-supply wells. The water in the aquifer is fresh and varies from a calcium bicarbonate to a calcium sulfate type in different areas. The Prairie Coteau aquifer occurs throughout most of Deuel and Hamlin Counties. The combined thicknesses of sand and gravel beds encountered in test holes ranged from 3 to 144 feet. This aquifer may yield as much as 250 gpm to domestic, stock, and irrigation-supply wells. The water in the aquifer is slightly saline and varies from a calcium sulfate to a calcium bicarbonate type in different areas. The Altamont aquifer underlines about 800 square miles, averages about 35 feet in thickness, and may yield as much as 500 gpm to stock wells. The water in this aquifer is slightly saline and varies from a sodium sulfate to a calcium sulfate type in different areas. The Dakota aquifer, the major bedrock aquifer, is composed of fine- to medium-grained sandstone which is from 60 feet to as much as 113 feet thick. The water is of poor quality for domestic use and certain other uses. It is moderately saline and of a sodium sulfate type. (Woodard-USGS)

WATER-LEVEL RECORDS FOR THE NORTHERN HIGH PLAINS OF COLORADO, 1973-77,
Geological Survey, Lakewood, Colo. Water Resources Div.
T. J. Major, R. G. Borman, and K. D. Vaught.
Open-file report 77-160, February 1977. 30 p, 2 fig, 1 tab.

Descriptors: *Water level fluctuations, *Water wells, *Irrigation wells, *Colorado, Basic data collections, Water levels, Well data, Aquifers, Water utilization, Great Plains.
Identifiers: *Northern high plains(Colo).

Water-level measurements were made in more than 600 wells during January 1977 in the northern High Plains of Colorado which includes about 9,500 square miles. Most of these wells were irrigation wells, but several stock and government-owned wells were also measured, especially in areas where there is little irrigation. Changes in water levels from January 1976 to January 1977 ranged from a rise of about 12 feet (3.7 meters) to a decline of about 10 feet (3 meters), both of which occurred in Kit Carson County. Measurements for the four preceding winters also are included to serve as references illustrating declining or rising water levels. (Woodard-USGS)

MANAGEMENT MODEL FOR GROUND WATER DEVELOPMENT,
Cornell Univ., Ithaca, N. Y. School of Civil and Environmental Engineering.
R. Willis, and B. A. Newman.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 103, No. WR1, Proceedings paper No. 12953, p 159-171, May 1977. 1 fig, 3 tab, 29 ref.

Descriptors: *Groundwater resources, *Aquifers, *Mathematical models, *Water management(Applied), *Optimization, Water supply, Economic efficiency, Water demand, Long-term planning, Finite element analysis, Flow, Control, Wells, Pumping, Equations, Systems analysis, Linear programming, Algorithms, Water resources development.
Identifiers: Control theory, Management systems, Cost minimization.

A mathematical model for the optimal dynamic management of regional groundwater supply resources is presented. The model, predicated upon a Galerkin finite element formulation of flow in heterogeneous anisotropic porous media, allows management decisions to be made regarding; (1) the possible well development sites within the

LIBRARY U. OF I. URBANA-CHAMPAIGN

ground water basin; and (2) the optimal pumping rates needed to meet an exogenous water demand in each planning period. The planning model minimizes the total discounted operational costs over the planning horizon. The algorithm solves a succession of linear programming problems obtained by linearizing the concave objective function using a generalized Taylor series expansion about an initial feasible decision vector. The management problem, structured as a problem in optimal control, is solved using Tui's concave programming algorithm. Results indicate the effectiveness of the model for the planning and development of ground-water resources. (Bell-Cornell)

FIRE EFFECTS ON WATER SUPPLY, FLOODS, AND SEDIMENTATION,
Pacific Southwest Forest and Range Experiment Station, Berkeley, Calif.
H. W. Anderson.
In: Proceedings Conference on Fire Ecology of the Pacific Northwest, Portland, Oregon, October 16-17, 1974, Oregon State U., Univ. Washington. Tall Timbers No. 15, p 249-260, 1976. 30 ref.

Descriptors: *Water supply, Streamflow, *Water quality, Sedimentation, Suspended sediment, Erosion, Floods, *Forest fires, *Burning, Mountain forests, Watersheds(Basins), Wood wastes, Soil physical properties, Forest management, Aquatic habitats, Stream chemistry, Ion transport, Nutrients, Forest ecology, Lumbering, *Pacific Northwest US.
Identifiers: *Fire hazard reduction, *Prescribed burning, Wildfires, Fuel breaks, Experimental forests, Multivariate analysis.

In the northwestern United States, forest fires and slash burning after logging have had striking hydrologic effects on timbered watersheds. Water quality has been altered, with turbidity increased by 4 to 67 times-- more than 80 ppm; summertime stream temperature raised by 13 to 16 degrees F., and stream oxygen content reduced to a degree deleterious to fish. Streamflow and flood water have increased after forest fires, with increases in annual flow ranging from 3.5 to 9 inches, and annual flood flows increases ranging from 10 to 20 percent. With repeated fires, detectable flow increases have persisted for as long as 17 years. Effects of fires on chemical water quality have been small except where surface runoff is involved; the acidic nature of forest soils has typically resulted in effectively buffering percolating chemicals released by burning. Post-fire use or treatment of burned areas may worsen or mitigate the hydrologic effects of burning. (Forest Service)

E. C. Ladd.
In: Biological Monitoring of Water and Effluent Quality, ASTM STP 607, J. Cairns, Jr., K. L. Dickson and G. F. Westlake, Eds., American Society for Testing and Materials, 1977, p 24-29, 4 ref.

Descriptors: *Pollutant identification, *Bioindicators, *Monitoring, *Water quality, *Effluents, *Industrial wastes, *Standards, *Waste treatment, Methodology, Regulation, Water quality control, Waste disposal.
Identifiers: *Biological monitoring, Industrial participation.

Biological monitoring is required, along with chemical and physical measurements, for complete assessment of the nature of industrial wastewaters and their impact on the quality of receiving waters. Various approaches to biological monitoring are discussed along with several examples of specific concerns of industry. The need and opportunities for industrial participation in development of biological methods are emphasized. (Katz)

EXPERIMENTAL SUBSTANTIATION OF MAXIMUM PERMISSIBLE PROPACHLOR (RAMROD) CONCENTRATIONS IN WATER, (IN RUSSIAN),
Academy of Medicine, Sofia (Bulgaria). Center for Hygiene.
A. Strateva.
Gig Sanit 4, p 85-87, 1976.

Descriptors: *Pollutant identification, Reservoirs, Water pollution effects, *Organoleptic properties, Water quality standards, Potable water, Water supply, Pesticides, *Dystrophy, Rodents, Metabolism, *Toxicity, *Pesticide toxicity, Testing.
Identifiers: *Ramrod, *Propachlor.

Negative effects of Ramrod on organoleptic properties of water and the sanitary condition of water reservoirs in threshold and subthreshold

concentrations, respectively, were determined. Orally administered Ramrod in acute tests showed toxic effects on mice, rats and rabbits. The LD50 for rats was 950(860-1050) mg/kg, for rabbits 392 (272-565) mg/kg and for mice 290 (240-350 mg/kg. Long-term tests on rats showed low cumulative and high adaptive effects with characteristic clinical (weight loss, changes in peripheral blood, redox processes and protein metabolism) and pathomorphologic (dystrophic changes in liver and kidneys) pictures. The threshold and subthreshold doses for warm-blooded animals were established at 5 mg/kg and 0.5 mg/kg, respectively, and the extrapolated subthreshold dose for humans at 0.05 mg/kg. With a reliability factor of 10, the daily permissible dose for humans was established at 0.05 mg/kg. Permissible Ramrod concentrations for water reservoirs are suggested to be 1 mg/l for drinking water and fish-farming and 20k mg/l for irrigation.--Copyright 1976, Biological Abstracts, Inc.

QUEST FOR AN INDEX OF COMMUNITY STRUCTURE SENSITIVE TO WATER POLLUTION,
Oxford Polytechnic (England). Dept. of Biology.
S. E. K. Cook.
Environmental Pollution, vol. 11, p. 269-288, 1976. 3 fig., 8 tab., 26 ref.

Descriptors: *Pollutant identification, *Bioindicators, *Reviews, *Reliability, *Water quality, Water pollution, Water pollution effects, Biological communities, Dominant organisms, Water chemistry, Sampling, Statistics, Regression, Analysis, Productivity, Monitoring.
Identifiers: Shannon-Wiener Index, Chandler Score, Berger and Parker Dominance Index.

A review is presented of indices summarizing benthic macroinvertebrate data and uses of samples from an unpolluted lentic stream to test their sensitivity to various environmental parameters. The Shannon-Wiener index is evaluated against the qualitative Chandler score. Values of both indices and a modification of the Chandler score were regressed with the following environmental variables: temperature, total alkalinity, conductivity, per cent oxygen saturation, dissolved oxygen content, biochemical oxygen demand and coliform count. The Shannon-Wiener index is primarily sensitive to total alkalinity which may be an indirect measure of stream productivity. The dominance index of Berger and Parker (1970) is highly correlated with the Shannon-Wiener index and is very much simpler to use. The Chandler modification is well correlated with the coliform count and BOD, parameters which are associated with pollution. The Shannon-Wiener index emerged as a very imprecise, if not dubious, pollution index. The modification of the Chandler score gives the most reliable continuous assessment. (Katz)

A LIGHT-WEIGHT AND CHEAP DEPTH SAMPLER,
Teesside Polytechnic, Middlesborough (England).
R. C. Frost, T. F. Bernascone, and T. Cairney.
Journal of Hydrology, Vol. 33, No. 1/2, p 173-178, March 1977. 4 fig, 4 ref.

Descriptors: *Pollutant identification, *Water sampling, Equipment, *Coal mines, Mining, *Sampling, *Instrumentation, Dissolved solids, Iron, Dissolved oxygen, Water quality, Foreign research, Groundwater, Shafts(Excavations), Depth, Wells.

A need for water samples from considerable depths in flooded collieries was met by a specially designed lightweight and cheap sampling system which proved entirely satisfactory in operation. Field tests have proved the efficiency of the system design. It has proved possible to repeat samples without difficulty, and many depth profiles of water composition have been obtained. Although the basic aim was to overcome the lack of funds, recent tests with commercially available depth samplers have shown that the specially designed system is more convenient and accurate in operation. DISSOLVED HELIUM IN LAKES: URANIUM PROSPECTING IN THE PRECAMBRIAN TERRAIN OF CENTRAL LABRADOR,
McMaster Univ., Hamilton (Ontario). Dept. of Physics.
W. B. Clarke, Z. Top, A. P. Beavan, and S. S. Gandhi.
Economic Geology, Vol. 72, No. 2, p 233-242, March-April 1977. 4 fig, 3 tab, 16 ref.

Descriptors: *Pollutant identification, *Helium, *Radioisotopes, *Uranium radioisotopes, *Exploration, Tracers, Geology, Tritium, Lakes, Sampling, Data collections, Mass spectrometry, Laboratory tests, Correlation analysis, Mineralogy, Isotope studies, *Canada.
Identifiers: *Uranium prospecting, *Labrador, *Neon, *Dissolved helium.

Measurements of dissolved helium, 3He/4He, and neon were made in 60 water samples collected from 56 lakes and ponds in the Kaipokok region in Labrador. Tritium was measured in 8 water samples. The aim of the survey was to search for excess 4He from decay of uranium and its daughter products. Excess 4He varied from about 0% to 65% relative to the equilibrium solubility concentration at the temperature of the sample. Delta (3He), the helium isotope ratio anomaly relative to atmospheric helium, varied from +11% to -25%. Although the effect of tritium decay in the water prior to sampling must be considered, there is a good correlation between the lakes which have delta (3He) -2% and lakes with excess radiogenic 4He greater than 4%. The helium results when plotted on a map of the area show a remarkable fit with the locations of known uranium mineralization. (Sims-ISWS)

RAPID DETERMINATION OF TOTAL ORGANIC CARBON AND ITS APPLICATION TO WATER RESEARCH, (IN JAPANESE),
Osaka City Inst. of Public Health and Environmental Sciences, (Japan).
T. Yoshikura, I. Fukunaga, K. Oda, S. Kawai, and G. Uno.
Bulletin of the Japanese Society of Scientific Fisheries Vol. 42(12), p. 1423-1429, 1976. 6 fig., 2 tab., 8 ref.

Descriptors: *Biochemical oxygen demand, *Chemical oxygen demand, *Carbon, Aquatic bacteria, Bioindicators, *Organic wastes, *Water pollution, Water chemistry, Chemical analysis, Water quality, *Methodology, *Pollutant identification, Analytical techniques.
Identifiers: *Total organic carbon, *Kjeldhal nitrogen measurements.

The quality of water polluted with organic compounds is usually expressed in terms of COD and BOD. Recently, a rapid combustion method for measuring total organic carbon (TOC) content of water was developed. Therefore, the determination TOC in the river water polluted with organic compounds was attempted and compared with other pollution parameters: BOD, COD, NH4-N, and bacterial counts with the following results. The measurement of TOC was not significantly influenced by the presence of toxic substances, biodegradability, chemical structure, molecular weight of the organic substances of their susceptibility to chemical oxidants. TOC correlated well with BOD, COD, NH4-N, Kjeldhal-N, and bacterial counts. It was concluded from these results that TOC measurement would provide rapid and accurate analysis of the extent of organic pollution in water. (Katz)

GUIDELINES ESTABLISHING TEST PROCEDURES FOR THE ANALYSIS OF POLLUTANTS,
Environmental Protection Agency, Washington, D.C.
Federal Register, Vol. 41, No. 232, p. 52780-86, December 1, 1976.

Descriptors: *Pollutant identification, *Permits, *Testing procedures, *Water analysis, *Monitoring, Water pollution control, Legal aspects, Administrative agencies, Legislation, Regulation, State governments, Local governments, Federal government, Measurement, Evaluation, Quality control, Sampling, Data collections, Water pollution sources.
Identifiers: FWPCA Amendments of 1972, Administrative regulations, Test parameters.

Amendments to the Guidelines Establishing Test Procedures for the Analysis of Pollutants were proposed pursuant to section 304(g) of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972. Such test procedures are to be used by permit applicants demonstrate that effluent discharges meet applicable pollutant discharge limitations and by the states and other enforcement activities in routine or random monitoring of effluents to verify compliance with pollution control measures. Comments to the proposed amendments were received from various federal, state and local agencies, as well as regulated major dischargers, analytical instrument manufactures and service laboratories. Based upon a review of the comments, various changes to the proposed amendments were made. Among the principal changes were: (1) a clarification of certain test parameters, (2) an addition of 44 new parameters, and (3) a deletion of certain measurement techniques. Despite certain objections from various manufactures, applications for approval of alternate test procedures will continue to be made only by National Pollution Discharge Elimination System (NPDES) permit holders with approval of such applications to be made on a case-by-case basis by the Regional Administrator. THE DIFFERENTIAL USE OF CHIRONOMIDAE AND CERATOPOGONIDAE (DIPTERA) IN THE MONITORING OF VARIOUS AQUATIC WASTES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Entomology.
E. C. Turner, Jr., and Walter I. Knausenberger.
Available from the National Technical Information Service, Springfield VA 22161 as PB-266 713, Price codes: A03 in paper copy, A01 in microfiche. Completion report, (1977). 46 p, 7 fig, 33 ref. OWRT A-042-VA(1).

Descriptors: *Diptera, *Midges, *Littoral, Mosquitos, *Virginia, Larvae, *Monitoring, *Bioindicators, Toxicity, Sewage effluents, Heavy metals, Sampling, *Pollutant identification.
Identifiers: Multiple-plate samplers, *Mosquito larvae, Tanytarsini, Toxicity tests, Negative phototaxis, Rapid biological monitoring, Culicoides, Aedes algypti.

Based on larval and adult determinations, 73 chironomid and 26 ceratopogonid taxa were recognized in a two-year survey of four polluted watercourses in southwestern Virginia. Comparative analysis of the midge community in two streams indicated strongly that larval midges can be used profitably to monitor water quality when the effluent is mixed heavy metal and domestic sewage. The chironomid tribe Tanytarsini and the ceratopogonid Culicoides were particularly sensitive. Community diversity d, equitability 'e,' and several methods of quantitative comparison among stations were validly applicable to the community of mides alone. A littoral sampling technique was compared with modified multiple-plate artificial substrates for the species each method collected. The littoral samples yielded significantly higher coefficients of variation, lower densities and fewer taxa than the multiple-plate substrates, but the investigation of the littoral fauna is an expedient method of assessing pollutional impact on smaller streams. An objectively quantifiable toxicity test involving the negative phototactic behavior of Aedes aegypti (Diptera:Culicidae) larvae was developed. It measured the progressive decrease in locomotory ability, i.e., enfeeblement, of the larvae in solutions of copper and zinc. Objective evidence of toxicity was obtained in one to six hours, significantly sooner than any other means of assessing toxicity in mosquito larvae.

ATOMIC ABSORPTION MEASUREMENTS OF LEAD, CADMIUM, COPPER, IRON, AND ZINC IN SESTON OF THE BALTIC SEA,
Biologische Anstalt Helgoland (West Germany).
H.-P. Weigel.
Helgolander Wissenschaftliche Meeresuntersuchungen, Vol 28, p 206-216, 1976. 3 fig, 3 tab, 26 ref.

Descriptors: *Heavy metals, *Zinc, *Cadmium, *Lead, *Copper, *Iron, *Path of pollutants, *Absorption, *Seston, *Aquatic microorganisms, Metals, Analytical techniques, On-site data collections. Spectroscopy, Chemical analysis, Water quality, *Pollutant identification.
Identifiers: *Baltic Sea, *Bioaccumulation, *Atomic absorption analysis.

Seston samples collected from 23 stations between Finnish Bay and Kiel Bight were analyzed for lead, cadmium, copper, iron and zinc by flameless atomic absorption spectrometry. The mean values for lead and cadmium were 123 and 5.8 ppm, respectively; for zinc, 733 ppm, for copper, 61 ppm, and for iron, 3535 ppm. In contrast to trace-metal analyses of off-shore seston, the concentrations for lead and cadmium in Baltic Sea seston are very high. These results agree with analyses for dissolved metals. The concentrations of zinc, copper and iron in the particulate matter from the Baltic Sea, apart from some local influences, agree well with values published from the concentrations in off-shore seston. The distribution and variation of individual values are discussed. (Katz)

OCCURRENCE AND DETERMINATION OF A HERBICIDE BENTHIOCARB IN RIVERS AND AGRICULTURAL DRAINAGES,
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
M. Suzuki, Y. Yamato, and T. Akiyama.
Water Research, Vol 11, No 3, p 275-279, 1977. 4 fig, 5 tab, 8 ref.

Descriptors: *Herbicides, *Weed control, *Agricultural chemicals, *Pollutant identification, Analytical techniques, Aquatic weed control, Computers, Analysis, Chemical analysis, Gas chromatography, Water analysis, Mass spectrometry, Rice, Instrumentation, Agricultural runoff, Foreign countries, Foreign research.
Identifiers: *Japan, *Benthiocarb, *Agricultural drainages, *Benthiocarb determination, Benthiocarb residues, Photo-chemical reactions.

The occurrence and determination of a herbicide, benthiocarb, 4-chloro-benzyl N,N-diethylthiolcarbamate in rivers and agricultural drainages were investigated. Benthiocarb residues were detected in water samples when it had been applied to rice paddies, after rice seedling transplantation, in concentrations of between 10.00 and 0.11 micrograms/l. The residues entered into rivers and agricultural drainages as a result of overflows from rice paddies. However, benthiocarb residues could not be found in water samples after the termination of its application to rice paddies, suggesting that the applied benthiocarb might be degraded by microbial and physicochemical actions such as photochemical reactions occurring on the soil surface. Benthiocarb residue levels were higher in longer rivers than in agricultural drainage. The contribution of rainfall to the benthiocarb concentrations was shown. Benthiocarb in water was extracted with n-hexane and identified by a gas chromatography using a flame photometric detector (sulphur filter 394 nm) and a combined gas chromatography-mass spectrometry-computer system. The minimum detectable amount of benthiocarb in water sample by gas chromatography was 0.56 ng, and about 100 ng of benthiocarb could be identified by a gas chromatography-mass spectrometry-computer system. THE ANALYSIS OF AMMONIA IN POLLUTED SEA WATER,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
B. L. Hampson.
Water Research, Vol 11, No 3, p 305-308, 1977. 3 fig, 1 tab, 13 ref.

Descriptors: *Ammonia, *Chemical analysis, *Pollutant identification, *Sea water, *Ammonium compounds, *Analytical techniques, Nitrogen compounds, Nitrogen, Water pollution sources, Water quality, Nitrates, Nitrites, Amino acids, Fish, Ultraviolet radiation, Colorimetry, Water analysis, Chemistry, Water pollution, Aquatic environment.
Identifiers: *Ammonium analysis, *Ammonium content, Indophenol blue reaction, Ammonium determination.

Measurement of ammonia in polluted seawater or freshwater is important, especially in fish rearing. However, existing methods for the determination of ammonia are subject to serious suppression interference by many substances, including all types of amines, nitrite, and amino acids, which may participate in the chain of reactions employed diverting it. Some methods suffer from breakdown of amino acids to ammonia. Hydrogen sulphide, often present in anoxic waters, also interferes and must be removed. The reported method overcomes the mentioned difficulties by internal standard calibration and by specific u.v. photo-activation of the required ammonia yields indophenol blue reaction at low temperature. American Water Works Association Journal, Vol 69, No 4, p 219-222, April 1977. 3 fig, 3 tab, 26 ref.

Descriptors: *Water pollution sources, *Rural areas, *Potable water, *South Carolina, Pollutants, *Pollutant identification, Path of pollutants, Water pollution sources, Wells, Water wells, Plumbing, Septic tanks, Inorganic compounds, Metals, Heavy metals, Turbidity, Sampling, On-site investigations, Laboratory tests.
Identifiers: Chesterfield County(SC).

A total of 217 potable water samples, from rural communities and farm families of Chesterfield County, South Carolina, was drawn randomly to evaluate inorganic contents and to determine whether any sources polluting the water could be identified. The findings of this survey showed that quite a few people were using substandard quality waters. Many of the open wells were infested with macroorganisms. Metallic contamination was quite common, and the levels of arsenic, iron, lead, mercury, and manganese, in some cases, were far above the mandatory limits. Low, but generally acceptable, concentrationss of nitrate, phosphate, chloride, fluoride, cadmium, copper, zinc, and sodium were found. Statistical evidence suggests that seepage from the septic tank was at least partially responsible for contamination of shallow water supply sources. The lead and cadmium appeared to come from the corrosion of the antiquated plumbing in the old houses. (Sims-ISWS)

REAERATION-COEFFICIENT MEASUREMENTS OF 10 SMALL STREAMS IN WISCONSIN USING RADIOACTIVE TRACERS--WITH A SECTION ON THE ENERGY-DISSIPATION MODEL.
Geological Survey, Madison, Wis. Water Resources Div.
R. S. Grant.
Available from the National Technical Information Service, Springfield, VA as PB-265 296/As, Price codes: A04 in Paper copy, A01 in microfiche. Water-Resources Investigations 76-96, October 1976. 50 p, 29 fig, 13 tab, 8 ref.

Descriptors: *Reaeration, *Streams, *Water pollution, *Tracers, *Radioactivity techniques, Methodology, Dissolved oxygen, Streamflow, Flow rates, Water temperature, Water pollution control, Forecasting, *Wisconsin, *Pollutant identification.

Reaeration-rate coefficients were measured for 10 small streams in Wisconsin using the radioactive-tracer method. The coefficients ranged from 2.06 to 55.2 per day (base e at 25 degrees Celsius). Stream discharges ranged from 0.3 to 37.0 cubic feet per second, most discharges being less than 10 cubic feet per second. Data also were collected for evaluation of the energy-dissipation model. The escape coefficient of 0.090 per foot at 25 degrees Celsius may be used for small streams similar to those studied. (Woodward-USGS).

AN INVESTIGATION OF COLLOIDAL ORGANIC PARTICLES ISOLATED FROM DIFFERENT POPULATIONS OF BIVALVES,
W. T. Lammers.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1540-1545, 1975. 4 fig., 1 tab., 13 ref.

Descriptors: *Analytical techniques, *Mollusks, *Colloids, *Tripton, Viruses, *North Carolina, Freshwater, Saline water, Density, Organic matter, *Salt marshes.
Identifiers: *Nucleic acids.

The low number of particles per unit volume make it difficult to obtain a sufficient number of organic coloids in natural water for analysis of virus and virus-like particles. This investigation attempted to determine whether detectable numbers of organic colloids are accumulated by bivalves, to characterize the particles, and to compare qualitative and quantitative changes in organic colloids from fresh and salt water. The colloids were extracted from bivalves collected from fresh water and saline marsh sites at different levels of pollution in North Carolina. The fresh water bivalves were Anodonta cataracta and Elliptio lanceolata; the lowest salinity bivalve was Polymesoda caroliniana; the mid-marsh animal was Modiolus demissus, and the outer marsh bivalve was Crassostrea virginica. Nucleic acid determinations were made of each sample before density gradient centrifugation and of selected particle bands afterwards by using the acridine orange fluorescent technique. The stained slides were viewed with a UV microscope using dark field and filtered to pass wavelengths between 460 and 530 nm. The results were quantified by measuring fluorescence and are expressed in microamps of fluorescence in a table. The virus-like particles fall into a group well separated from other known particles by density, sedimentation coefficient, and the presence of nucleic acid. Consequently relatively small colloids and virus-like particles. (Auen-Wisconsin).
W77-07498

SIMILARITIES AND DIFFERENCES IN THE CHEMICAL COMPOSITION OF WATERS FROM WEST, CENTRAL, AND EAST AFRICA,
S. A. Visser, and J. P. Villeneuve.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1416-1425, 1975. 4 tab., 51 ref.

Descriptors: Chemical properties, *Lakes, *Rivers, *Africa, Specific conductivity, *Statistical methods, Hydrogen ion concentration, Cations, Anions, Sodium, Potassium, Ammonia, Iron, Aluminum, Chlorides, Fluorides, Calcium, Magnesium, Manganese, Chlorine, Nitrates, Nitrites, Silica, Sulfates, Phosphates, Data collections, *Pollutant identification.
Identifiers: West Africa, East Africa, Central Africa, *Ranking methodologies.

Comparisons are made of data on specific conductivity, hydrogen ion concentration, cations and anions of 22 lakes and rivers in West Africa, 9 Central African lakes and rivers, and 21 East African lakes and rivers. The data is based on 520 samples collected from over 150 sites, and from earlier studies. The number of times, expressed on a percentage basis, that one of the 108 parameters had a 99% significant correlation with any other parameter, is tabulated for each region. Because of the large number of highly significant correlations those with the highest listed numerical value indicate water quality of a specific area, and can serve in the selection of useful chemical or physical indicators of water quality in the respective area. The chemical measurements, in ppm, are given for sodium, potassium, ammonia, calcium, magnesium manganese, iron, aluminum, chlorine, fluoride, nitrate, nitrite, silica, sulfate, and phosphates. (Auen-Wisconsin)
W77-07510

CALCULATION OF CALCIUM CARBONATE-CARBON DIOXIDE EQUILIBRIUM IN WATER AND MIXTURES OF WATER,
A. Lindberg, and C. Borno.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1511-1517, 1975. 5 fig., 1 tab., 14 ref.

Descriptors: *Computer programs, *Calcium carbonate, *Carbon dioxide, *Equilibrium, Measurement, Methodology, Equations, Analytical techniques, *Pollutant identification.

A preliminary computer program is outlined which is used for approximate calculations of calcium carbonate-carbon dioxide equilibrium relations in natural waters and mixtures of waters. The program also permits the calculation of equilibrium alternations when the pH value of the water is changed by the addition of acid or alkali or when the water is heated in a heat exchanger, etc. The program is in the process of development thus its details are incomplete. The development work is carried out on an HP calculator 9100 B with an extended memory 9101 A. A flow chart and equations illustrate the calculation principle. The data required are the pH value, specific conductance, temperature and the concentrations of bicarbonate, bicarbonate anions and calcium, calcium ions in the water. (Auen-Wisconsin)

LIMITATIONS OF SINGLE WATER SAMPLES IN REPRESENTING MEAN WATER QUALITY 1. THOMPSON RIVER AT SHAW SPRING, BRITISH COLUMBIA,
Department of the Environment, Ottawa (Ontario). Water Quality Branch.
E. Oguss, and W. E. Erlebach.
Technical Bulletin No. 95, 1976, 22 p., 3 fig., 1 tab, 6 ref., 2 append.

Descriptors: *Water sampling, *Sampling, Average, Limiting factors, Spatial distribution, Monitoring, Water analysis, *Pollutant identification, *Canada, Water quality, Phosphorus, Nitrates, Nitrites, Iron, Fluoride, Lead, Zinc, Silica, Hydrogen ion concentration.
Identifiers: Errors, *Thompson River(BC), Shaw Spring, *British Columbia, Single water sampling, Spences Bridge Station, Nicola River.

This study was undertaken to determine the degree to which infrequent single grab samples are representative of the monthly or quarterly mean water quality of the Thompson River in the vicinity of the station at Spences Bridge. The study was designed to determine the magnitude of spatial and temporal variability in the concentrations of the following parameters: total phosphorus, nitrate plus nitrite, iron, fluoride, lead, zinc, silica and pH. These parameters were selected because they had shown marked variation in previous quarterly sampling. The results illustrate the uncertainities associated with single grab samples as indicators of quarterly mean concentrations. For example, if a single sample has a total phosphorus concentration of 0.054 mg/1, one can conclude with 95 percent confidence that the true instantaneous mean value is between 0.040 mg/1 and 0.068 mg/1 and that the true quarterly mean value is between 0.0 mg/1 and 0.127 mg/1. Furthermore, the need for caution in inferring the presence of a trend on the basis of single samples taken quarterly is apparent. The use of quarterly sampling data as a means of flagging water quality impairment or measuring trends must include a consideration of both alpha and beta errors. Errors associated with getting a high single sample when the mean concentration is in fact low (alpha error or false positive) and errors associated with getting a low single sample when the mean concentration is in fact high (beta error or false negative) could lead to erroneous conclusions. Improvements in analytical technique and sample handling cannot increase the precision with which a single sample measurement represents mean instantaneous, temporal or spatial concentrationss. Descriptors: *Heavy metals, Iron, Copper, Cadmium, Lead, Chromium, Manganese, *Spectrophotometry, Analytical techniques, Zinc, *Pollutant identification, Lakes.
Identifiers: *Lake Constance(Switzerland), *Atomic absorption spectrometry, *Greifensee(Switzerland), Pelagic zone(Lakes).

Monthly measurements were made over a 1 yr period to determine the heavy metals Fe, Mn, Cd, Cr, Cu, Pb and Zn in the vertical profiles of Lake Constance (Obersee and Untersee) and Greifensee, by means of atomic absorption spectrometry. Fe and Mn exhibited the usual cyclical fluctuations depending on redox conditions in the hypolimnion. For Cd, Cr, Cu, Pb and Zn no concentration patterns were noted that would show their dependency on seasonal and vertical stratifications.--Copyright 1977, Biological Abstracts, Inc.

A COMPARISON OF SPECTROPHOTOMETRIC METHODS FOR THE DETERMINATION OF PHYTOPLANKTON PIGMENTS, (IN FRENCH),
Biological Station, Besse-en-Chandesse (France).
G. Millerioux.
Ann Stn Biol Besse-En-Chandesse 9, p 59-78, 1974.

Descriptors: *Spectrophotometry, *Phytoplankton, *Pollutant identification, Pigments, *Plant pigments, Sampling, Analytical techniques, Lakes, Methodology.
Identifiers: Lake d'Aydat(France).

The size of the sample to be filtered is a function of the density of the phytoplankton and in Lake d'Aydat (France) a sample of between 1-2 l was needed. Best results were obtained when the magnesium carbonate concentration was adjusted to a constant figure. Whatman glass fiber filters are recommended as giving the best results. Acetone (90%) is the best solvent. It is recommended that samples be treated as quickly as possible after taking; samples left more than a few days do not give consistent results.--Copyright 1977, Biological Abstracts, Inc.

BACTERIOLOGICAL AND COLIMETRIC EXAMINATION OF THE WATER SUPPLIED TO THE SLAUGHTERHOUSES SITUATED NEAR SALVADOR, BAHIA, BRAZIL, (IN PORTUGESE),
Bahia Univ., Salvador (Brazil). School of Veterinary Medicine.
E. N. Teixeira, and C. A. Cordeiro.
Bol Inst Biol Bahia 14(1), p 129-133, 1975.

Descriptors: *Aerobic bacteria, *Coliforms, Sampling, Water quality standards, South America, Water pollution, *Bacteriology, *Pollutant identification.
Identifiers: *Colimetric examinations, Slaughterhouses(Wastes), *Salvador(Brazil).

A survey was done to determine the number of viable aerobic bacteria and coliform density from water used in 5 slaughterhouses near Salvador, Bahia, Brazil. Only 11 of 250 samples analyed were within bacterimetric and colimetric standards adopted in Brazil. The average bacterimetry was 3105.45 plus or minus 250.05 and the average colimetry was 1766.65 for 1 ml and 100 ml, respectively.--Copyright 1977, Biological Abstracts, Inc.

STUDY OF BACTERIAL CONTAMINATION IN THE PORT MAHON HARBOR: EFFECT OF ECOLOGICAL CONDITIONS OF THE HARBOR, (IN SPANISH),
Instituto Espanol de Oceanografia, Palma de Mallorca (Spain). Coastal Lab.
B. Payeras Cifre.
Bol Inst Esp Oceanogr 203-204, p 1-24, 1975.

Descriptors: Bacteria, Water pollution, Ecology, Coliforms E. coli, Harbors, Streptococci, Phytoplankton, Dissolved oxygen, Sampling, Pollutant identification.
Identifiers: Heterotrophic(Activity), Port Mahon Harbor(Spain).

Analysis of water samples taken in April showed that Escherichia coli, Streptococcus faecalis and coliform contamination from urban wastes was highest at stations near the interior of the Port Mahon harbor (Spain). Dissolved O2 was highest at the interior mainly because of the presence of abundant phytoplankton in the springtime. Fecal contamination indices were established for the different sampling stations and the relation between fecal contaminations and heterotrophic activity were discussed. The construction of an underwater pipeline to deposit residual waters into deeper waters and improve ecologic conditions was proposed.--Copyright 1977, Biological Abstracts, Inc.

5B. Sources Of Pollution

INTERACTIONS OF CUPRIC ION WITH HUMIC ACID,
Missouri Univ. Columbia. Dept. of Chemistry.
J. B. Green.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 338, Price codes: A11 in paper copy, A01 in microfiche. M.A. Thesis, (1975). 225 p, 16 fig, 25 tab, 76 ref. OWRT B-115-MO(1), 14-34-0001-6095.

Descriptors: *Humic acids, Coal, Copper, Ions, *Leaching, Heavy metals, Neutralization, Coal mines, Chelates, Acids, Waste water treatment.
Identifiers: *Coal humic acids, *Cupric ion.

The properties of coal humic acids were examined with the objective of determining their suitability for removing some of the major pollutants associated with the mining and use of coal. The preparation and characterization of coal humic acids is described. Their acid-base and precipitation behavior were determined. Rates and equilibria for leaching of copper from insoluble copper salts by coal humicacids were measured. The formation constants of soluble copper humate chelates were measured. Binding of copper by insoluble coal humic acids in acidic media was investigated. Even at pH values as low as 2, copper is bound to insoluble coal humic acid in water.

THE EFFECT OF THE USE OF PESTICIDES AND FERTILIZERS IN THE WATER PROTECTION ZONE WITH SOURCES OF ARTIFICIAL REPLENISHMENT OF UNDERGROUND WATER RESERVES, (IN RUSSIAN),
Kiev Research Inst. of General Communal Hygiene (USSR).
G. M. Pakhov, R. V. Petrov, V. V. Tsapko, and L. N. Vanyurikhina.
Gig Sanit 3, p 101-102, 1976.

Descriptors: Water pollution sources, *Insecticides, *Fertilizers, Agricultural runoff, *Path of pollutants, DDT, *Pesticide residues, Soil analysis.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *USSR(Severskii Donets river valley), Atrazine, Mataphor, Granosan.

Tests were conducted in the water protection zone of the Severskii Donet river valley (USSR) to determine the possible pollution by insecticides and fertilizers of run off waters from farmlands entering underground streams feeding several intakes. Soil probes indicated that metaphos, DDT, granosan and atrazine remained in the upper layer of the soil and did not penetrate down to the water table. Hexachlorocyclohexane was found in surface and river waters of the intakes indicating penetration was possibly due to physical and chemical composition of the soil, amount of rainfall, geological relief, height of the water table or hydraulic connection of the Upper Cretaceous water-bearing horizon with the polluted waters of the Severskii Donets and its tributaries. Comparative data over a 10-yr period showed in increase (300-400%) in dry residues, chlorides (500%), sulfates (700-800%) and acidity (150%) in the intakes due to use of mineral fertilizers.--Copyright 1977, Biological Abstracts, Inc.

NITRATE IN GROUND WATER AND ITS RELATION TO FERTILIZATION, (IN GERMAN),
Mainz Univ. (West Germany). Hygiene Institut.
J. Borneff, and B. Adade.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 157(4), p 337-355, 1973.

Descriptors: *Nitrates, *Groundwater, *Fertilization, Potable water, Water treatment, *Waste water treatment, Water wells, Water pollution, Public health.
Identifiers: *Nitrosamines, MetHb.

A high content of NO3- in drinking water is particularly hazardous to infants because of the formation of metHb. If sufficient amounts of nitrosamines are formed and become active in the digestive tract, there is a risk of cancer to all age groups. Various prophylactic measures are required. The admission of increasing amounts of NO3- into ground water must be avoided. Techniques to decrease the amount of NO3- in drinking water and appropriate instructions on domestic food preparations must be applied. For 2 yr at 14 day intervals checks were made of 3 wells in the Mainz, West Germany, basin and the upper layers of the soil in the immediate catchment areas. The highest amount of NO3- in soil was found in the vicinity of 2 of the wells situated in a wine growing area and corresponded to the fertilization period (June and July). A minimum amount was recorded in winter. The wells carried the highest amount of NO3- 6 mo. later. Amounts of NO3- in unfertilized soil of the same area followed similar principles, i.e., untreated soil also contributed NO3- to the ground water. The NO3- fluctuation in the 3rd well situated in a fruit- and vegetable-growing area was less evident, but concentrations were somewhat higher, even though the fertilization was not more intense than that in the wine growing area. The extent of vegetative cover and the porosity of the soil are decisive factors for the fertilization-dependent NO3- concentration in ground water. The leaching of naturally formed NO3- in the soil is also of considerable importance. A rigorous restriction of the use of mineral fertilizer alone cannot be successful in controlling NO3- leakage into ground water. Prophylactic measures must be extended to cover the avoidance of overfertilization, optimal cultivation of the soil, correct of sites and good construction techniques of wells. If these measures do not lower the NO3- content of drinking water to the recommended WHO standards, the water must be treated (e.g., by means of ion exchangers biological denitrification), and where this is impossible, measures must be taken domestically (e.g., special water for infant food, etc.). NO3- standards regarding the formation of nitrosamines are not yet established.--Copyright 1974, Biological Abstracts, Inc.

THE RATE OF MICROBIAL DEGRADATION OF OIL IN A BEACH GRAVEL COLUMN,
University Coll. of North Wales, Bangor. Marine Science Labs.
C. F. Gibbs, and S. J. Davis.
Microbial Ecology, vol. 3, p. 55-64, 1976. 6 fig., 1 tab., 12 ref.

Descriptors: *Microbial degradation, *Oil, *Biodegradation, Oil pollution, Laboratory tests, Percolator, Nutrient, Requirements, Water temperature, Laboratory equipment, Microorganisms, Methodology.
Identifiers: Crude oil, Continuous flow respirometer, Nutrient supplements, Oxidation rates.

An automatic, continuous flow respirometer was used to follow the bio-oxidation of a crude oil in a column of fairly coarse beach material. A number of water percolation rates were employed, with and without inorganic nutrient supplementation (nitrate and phosphate). Initially, nutrient supplementation was required to allow significant oxidation rates, but a capacity for biodegradation in the absence of continued supplementation developed slowly. The increase in oxidation rate with nutrient supplementation was in the proportion of 0.23 mg oxygen per micromole nitrate. This proportionality was similar to previous results (using different systems), as was the effect of temperature. The mean of two Q10 values was 2.7. (Katz)

NITROGEN CONTAMINATION SOURCES IN SHALLOW GROUND WATER, LAS VEGAS AREA, NEVADA,
Nevada Univ. System, Reno. Water Resources Center.
J. W. Hess, and R. O. Patt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 328, Price codes: A04 in paper copy, A01 in microfiche. Technical Report Series HW-32, April 1977. 60 p, 9 fig, 8 tab, 43 ref, 2 append. OWRT B-085-NEV(1). 14-31-0001-6097.

Descriptors: *Groundwater, *Nitrates, Nitrogen, Organic soils, Water quality, Groundwater mining, Mathematical models, Chemical analysis, Soil moisture, Resistivity, *Nevada, Water pollution sources.
Identifiers: *Las Vegas Valley(Nev), *Shallow groundwater.

The problem of high nitrate concentrations in shallow ground water in the Gilcrease Ranch area of Las Vegas Valley, Nevada first became apparent in 1972 when Clark County District Health Department officials reported nitrate concentrations of up to 450mg/l in domestic wells of the area. Presently high nitrate concentrations affect at least 40 homes in a 17 km2 area. Possible sources for these high nitrate levels include nitrogen organic and/or evaporite materials. High nitrate concentrations in ground water in the area are encountered in first water at 26 to 28m depth and extend to a depth of 44m. Contamination of the better quality lower aquifer zones has apparently not yet occurred. Based on geochemical, hydrologic and volumetric evidence: (1) ammonium sulfate fertilizer used on the Gilcrease Ranch probably is not a significant source of nitrate, (2) septic systems and animal corrals leachates are not prime sources of nitrate to most wells and (3) natural nitrate producing sources are the most likely source of nitrate pollution in the study area. Homes with nitrate concentrations in well waters exceeding 45 mg/l should use uncontaminated water from other sources for drinking and culinary pruposes until either a new, properly constructed well is drilled or other water service is provided. All new wells in the area should be drilled to a depth sufficient to provide water from the lower good quality aquifers and should be sealed for at least the first 60m. (See also W76-09762)

A. Mariotti, and R. Letolle.
Journal of Hydrology, Vol. 33, No. 1/2, p 157-172, March 1977. 6 fig, 2 tab, 16 ref.

Descriptors: *Water pollution sources, *Nitrates, *Watersheds(Basins), *Agricultural runoff, Agricultural watersheds, Foreign countries, Foreign research, On-site investigations, Tracers, *Path of pollutants, Nitrogen, Runoff, Farm wastes, Fertilizers, Groundwater, Surface waters, Agriculture, *Isotopic studies.
Identifiers: *France(Melarchez Basin), *Nitrogen-isotope studies.

The isotope ratio N15/N14 of nitrates were studied on a small basin near Paris, in an intensively cultivated area. The measurements were made at the basin outlet. This study allowed the distinction to be made between three potential nitrogen inputs: (1) nitrates from the local nitrogen cycle; (2) nitrates from nitrification of animal wastes; and (3) nitrates from artificial fertilizers. The isotope balance indicated that the preponderant source for nitrates was from artificial fertilizers. (Humphreys-ISWS)

LEACHING CHARACTERISTICS OF POLLUTED DREDGINGS,
Hayward Baker Co., Odenton, Md.
J. S. Jin, R. J. Krizek, and G. L. Roderick.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 103, No. EE2, Proceedings Paper 12848, p 197-215, April 1977. 2 fig, 5 tab, 11 ref. EPA 15070-GCK, R-800948.

Descriptors: Leaching, *Dredging, Water pollution, *Permeability, *Water pollution sources, Additives, Channel improvement, Soil amendments, Desilting, Leachate, Soil water, Groundwater, Subsurface drainage, Properties, Infiltration, Chemical analysis, Pollutants, Sedimentation, Waste disposal, Wastes, Landfills, Trace elements, Bottom sediments.
Identifiers: *Leaching characteristics, *Dredges, *Disposal sites, *Spoil, *Great Lakes harbors, Chemical constituents, Chemical additives.

This study was directed toward evaluating the pollution potential of leachates from seven different dredged materials and the effect of various additives on improving leachate quality, as well as sedimentation characteristics and shear strength. Based on the results of sequential series of sedimentation tests and sedimentation-leaching tests with and without additives, no significant changes in leachate quality were observed; increases in the specific ion concentrations and increases in the dissolved solids of the leachates were directly attributable to the additives used. In most cases there were increases in the solids due to flocculation, and lime was found to be effective in stabilizing the soil structure, increasing the permeability of the sediment and hastening the rate of leachate production. In an effort to assess the long-term pollution potential of such leachates with and without addition of lime, a series of repeated leaching tests were performed. The leachates from the dredged materials tested do not appear to cause any serious pollution problem. (Henley-ISWS)

STOCHASTIC PROPERTIES OF DAILY TEMPERATURE IN RIVERS,
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
C. C. S. Song, and C-Y. Chien.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 103, No. EE2, Proceedings Paper 12858, p 217-231, April 1977. 6 fig, 5 tab, 9 ref, 1 append. NSF ENG 74-02036.

Descriptors: *Water temperature, *Rivers, *Regression analysis, Air temperature, Correlation analysis, *Stochastic processes, Temperature, Thermal pollution, Freezing, Probability, Model studies, Mathematical models, Statistical methods, Statistics.
Identifiers: Stochastic models, Probability theory.

Some stochastic properties of the daily range of water temperature variations in rivers, mostly located in the central part of the United States, were analyzed using data published by the U.S. Geological Survey. It was found that the water temperature variation follows quite closely the patterns of air temperature variation when the river is not subjected to freezing. Freezing tends to inhibit the water temperature variation, and the degree of daily temperature variation diminishes as the daily mean temperature approaches 0 C. As a result, the daily range of water temperature variation of a freezing river is highly correlated with daily mean water temperature. Some aspects of auto-regression and cross-regression models were reviewed and applied. An air-water temperature response coefficient was found to correlate well with a dimensionless number representing the ratio of the characteristic period of air temperature variation and the characteristic time scale of heat transfer in a river. (Sims-ISWS)
W77-07159

CONVECTIVE-DISPERSION IN PERENNIAL STREAMS,
Sargent and Lundy, Chicago, Ill.
A. Prakash.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 103, No. EE2, Proceedings Paper 12891, p 321-340, April 1977. 11 fig, 4 tab, 25 ref, 1 append.

Descriptors: *Convection, *Dispersion, *Water pollution sources, *Streams, Rivers, Radioactive waste disposal, Model studies, Mathematical models, Pollution, Streamflow, Channels, Mixing, Effluents, Analytical techniques, *Path of pollutants.
Identifiers: Method of images, Nonpoint sources of pollution.

Mathematical models were developed to predict the spatial distribution of concentration of radioactive effluents discharged into a perennial stream. The models include continuous, instantaneous, and finite time release of effluents from point, line, plane, and parallelepiped sources. Analytical solutions were presented for both steady-and nonsteady-state transports of effluents. The effect of finite channel dimensions was taken care of by the method of images. The sensitivity of the mixing process to the variations in the coefficients of transverse and in the vertical dispersion was illustrated by numerical examples. The practical application of each solution was demonstrated by solving specific field problems. (Sims-ISWS)

NONPOINT SOURCE EFFECTS ON WATER QUALITY,
Florida Technological Univ., Orlando.
M. P. Wanielista, Y. A. Yousef, and W. M. McLellon.
Journal Water Pollution Control Federation, Vol. 49, No. 3, p 441-451, March 1977. 5 fig, 10 tab, 24 ref.

Descriptors: *Water quality standards, *Water pollution sources, Pollutants, *Florida, Urban runoff, Agricultural runoff, Land use, Precipitation(Atmospheric), Wastes, Chemicals, Heavy metals, Pesticides, Fertilizers, Instrumentation, Data collections, Lakes, Streams, Watersheds(Basins), Water pollution, *Standards, *Path of pollutants.
Identifiers: *Nonpoint sources of pollution, Mass loading, Loading rates, Mass standards.

Results of a project to define the nature and extent of nonpoint source water quality responses were reported. Included were some details of a procedure to construct instrumentation that can automatically collect water samples in a way that reflects field conditions, water quality response curves related to point and nonpoint sources, and development of loading rates from nonpoint sources for urban and non-urban basins. A pollutant mass standard was proposed where appropriate, in addition to concentration standards. The work is useful as an aid to establish field measuring programs to determine the characteristics and extent of nonpoint and point source pollution. Results for two basins in central Florida were presented. A comarison of these results considered with other data indicated the necessity of site-specific studies. (Sims-ISWS)

Journal of Geophysical Research, Vol. 82, No. 6, p 977-978, February 20, 1977. 5 fig, 7 ref. NASA NGL 24-005-263, EPA R005175-02.

Descriptors: *Sediment transport, *Winds, *Lake Superior, *Model studies, *Great Lakes, Mathematical models, Circulation, Water circulation, Suspended solid, Lakes, Satellites(Artificial), Remote sensing, Turbidity, Pollutants, *Path of pollutants, Water pollution, Limnology.
Identifiers: LANDSAT, Taconite tailings.

Transports for Lake Superior were obtained by using a depth-integrated model applied to a 6 x 6 km grid. The results were used to explain the movement of red clay plumes in extreme western Lake Superior. For northeasterly winds, the calculated transports and LANDSAT data on turbidity show that the plumes originating along the Wisconsin shore move toward Minnesota Point and are then taken out along the axis of the arm of the lake because of a return path produced by currents along the Minnesota and Wisconsin shores converging at Minnesota Point. The results from the model also account for the migration of taconite tailings along the Minnesota shore from Silver Bay to the Duluth water intake. (Sims-ISWS)

ENTEROVIRUS AND BACTERIOPHAGE INACTIVATION IN SUBSURFACE WATERS AND TRANSLOCATION IN SOIL,
New Mexico State Univ., University Park. Dept. of Biology.
J. G. Yeager, and R. T. O'Brien.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 708, Price codes: A04 in paper copy, A01 in microfiche.
New Mexico Water Resources Research Institute, Las Cruces, Report No. 083, Partial Completion Report, January 1977, 40 p, 2 fig., 5 tab, 45 ref. OWRT A-052-NMEX(4). 14-34-0001-7066.

Descriptors: Microorganisms, Water pollution, *Viruses, *Bacteriophage, Investigations, *New Mexico, Subsurface waters, Surface waters, Septic tanks, *Translocation, Environmental sanitation, Human pathology, Public health, Soils, *Path of pollutants, Groundwater.
Identifiers: Inactivation, Rio Grande River(N Mex), Soil adsorption-elution, *Poliovirus 1, *Coxsackievirus B-1, *Enterovirus.

Inactivation of poliovirus 1, coxsackievirus B-1 and bacteriophages was studied in surface and subsurface waters and in septic tank liquor. In situ experiments were conducted in Rio Grande River water and in shallow ground water using dialysis membrane chambers with sidewalls. Laboratory inactivation studies were performed using deep Groundwater and septic tank liquor. Soil adsorption-elution characteristics of the viruses and bacteriophages were studied using the surface and subsurface waters as eluents. Results showed that the viruses and bacteriophages were inactivated at different rates in the waters tested. The rate of inactivation varied with virus and bacteriophage type and with water type. Extended survival of poliovirus 1 and coxsackievirus B-1 was demonstrated in shallow groundwater and septic tank liquor when compared to survival in deep groundwater. Inactivation of bacteriophages was generally faster than the viruses, and statistical comparison of inactivation rates showed that none of the bacteriophages studied would serve as suitable general indicators of enteric virus inactivation in the waters tested. Soil adsorption-elution studies showed that virus adsorption characteristics varied with virus, water, and soil type. The elution of the enteric viruses from soils was more efficient with septic tank liquor and deep groundwater. The results suggest that a health hazard could exist if pathogenic, enteric viruses were introduced into surface and groundwaters which are destined for domestic or other uses. The results also show that it is impossible to make valid generalizations regarding virus soil adsorption characteristics based on studies using only one virus, soil, or water type. GEOLOGISTS CLAIM HEALTH CAN BE TRACED TO ROCKS,
News in Engineering, Ohio State University, Columbus, Vol. 49, No. 1, p 10, 24, January, 1977.

Descriptors: *Human diseases, *Rock properties, *Diseases, *Environmental effects, *Soil chemical properties, *Weathering, Hardness(Water), Magnesium, Trace elements, Zinc, Fluorides, Public health.
Identifiers: Cancer, Bone disease, Selenium.

Statistics show that throughout the world, lifespan and disease patterns differ significantly between various geographical areas. New evidence suggests that some of this variance may be due to the rocks and soils of given areas, according to faculty members of the Ohio State University Geology Department. Correlations between level of iodine and goiter, fluoride and tooth decay, and high zinc concentrations and bone disease are among the most obvious to date. There are also statistical sugestions that human death rate is higher in areas with a deficiency of weatherable materials in the soil, and that cardiovascular disease is more prevalent in areas with soft water. Various types of cancer may also have geographical influences. These latter correlations remain very inconclusive, however, and much more research with attention to intervening variables is necessary before causal relationships can be inferred.(Eberle-NWWA)

LONG ISLAND BEACH POLLUTION: JUNE 1976,
National Oceanic and Atmospheric Administration, Boulder, Colo. Marine Ecosystems Analysis Program.
MESA Special Report, February 1977. 85 p, 24 fig, 11 tab, 38 ref, 2 append.

Descriptors: *Water pollution sources, *Flotsam, Pollutants, *Pollutant identification, Beaches, Winds, Wastes, Path of pollutants, New York.
Identifiers: *New York Bight, *Long Island, Floatable wastes.

Information is given on the nature and possible sources of floating trash and pollutants that were washed up in large quantities on most of Long Island's beaches during June 1976. The general orientation is defined and the roles played by the Federal, State and local agencies during the beach pollution event are described. The waste materials identified on the beaches are described; they include tar and grease balls, sewage-related items, garbage, trash, and charred wood. Historical surface wind data and the wind conditions during June 1976 were analyzed, surface drifter studies were examined and the U. S. Coast Guard and the Brookhaven National Laboratory surface transport models were applied to the events of June 1976. It was concluded that persistent southerly wind-driven transport was responsible for the stranding of the floatables. Southerly surface winds with about 8.0-kn velocities are not unusual for June over the Bight. The Hudson/Raritan estuarine outflow is a major source of floatables to the waters of the New York Bight. It also suggested that sewage sludge dumping has been a minor contributor to the floatables found on the beaches. It is understood that effective corrective measures cannot take place until quantitative documentation of the sources of floatables has been accomplished. (NOAA)

EFFECTS OF MAN'S ACTIVITIES ON GROUNDWATER QUALITY,
Kiel Univ. (West Germany). Geologisch-Palaeontologisches Institut und Museum.
G. Matthess.
Hydrological Sciences Bulletin, Vol 21, No 4, p 617-628, December 1976. 97 ref.

Descriptors: *Groundwater, *Water pollution sources, *Pollutants, Infiltration, Groundwater movement, Path of pollutants, Water quality, Water pollution, Geochemistry, Biochemistry, Fertilizers, Agricultural chemicals, Solid wastes, Leaching, Pesticides, Salts, Geology, Pollution.

The changes in groundwater quality that result from man's activities were reveiwed. This paper considered the various geochemical reactions, the biochemical processes, and the physical processes that take place as well as the sources of pollution. Suggestion were made for future research, and practical guidance was given for avoidance of pollution of groundwater or for minimizing its effects. (Sims-ISWS)

ANTHROPOGENICALLY REDUCED GROUNDWATERS,
Coblenz Federal Inst. of Hydrology (West Germany).
F. Schwille.
Hydrological Sciences Bulletin, Vol 21, No 4, p 629-645, December 1976. 9 fig, 40 ref.

Descriptors: *Groundwater, *Dissolved oxygen, *Water pollution sources, *Reduction(Chemical), Oxygen, Geochemistry, Water pollution, Microbial degradation, Biodegradation, Biochemistry, Groundwater movement, Waste disposal, Path of pollutants, Water quality, Oxidation, Canals, Infiltration.

Groundwaters which have lost their original oxygen content as a consequence of reducing i.e., oxygen-consuming microbial processes, are a com-

mon phenomenon in nature. But man, too, can change oxygenocontaining waters in a variety of ways into oxygen-free groundwaters. The different ways of 'groundwater reduction' by man's activities were illustrated by way of selected examples. (Sims-ISWS)

PHOSPHORUS AND CARBON DISTRIBUTIONS IN A POLLUTED COASTAL ENVIRONMENT,
Lancaster Univ., Bailrigg (England). Dept. of Environmental Sciences.
S. R. Aston, and C. N. Hewitt.
Estuarine and Coastal Marine Science, Vol 5, No 2, p 243-254, March 1977. 4 fig, 3 tab, 19 ref.

Descriptors: *Phosphorus, *Carbon, *Distribution, *Coasts, *Pollution identification, Tidal waters, Sewage effluents, Intertidal areas, Particle size, Sediment distribution, Sampling, *Path of pollutants.
Identifiers: *England(Walton Backwaters), Particulates.

Phosphorus and organic carbon distributions were used to examine the effect of pollution from sewage effluents on a semi-enclosed tidal area. The phosphorus and organic carbon accumulating in the sediments of the area were related to the influx of particulate matter during tidal cycles, and some of the environmental factors determining the influence of marine effluent disposal on a coastal zone were assessed. STUDY ON THE HERBICIDAL PROPERTIES OF BENTHIOCARB; FACTORS AFFECTING HERBICIDAL ACTIVITY AND ITS BEHAVIOR IN SOIL, (IN JAPANESE),
Utsunomiya Univ. (Japan). Coll. of Agriculture.
N. Ichizen.
Bull Coll Agric Utsunomiya Univ 9(3), p 109-125, 1976.

Descriptors: *Herbicides, *Carbamate pesticides, *Grasses, Humus, Percolation, Water temperature, Soils, Growth stages, Water pollution, Path of pollutants, Soil types, Depth.
Identifiers: Echinochloa-crus-galli-var-oryzicola, Eleocharis-acicularis, Monochoria-vaginalis, *Benthicarb.

The susceptibility of barnyard grass (Echinochloa crus-galli P. Beauv. var. oryzicola Ohwi), monochoria (Monochoria vaginalis Presl.) slender spikerush (Eleocharis acicularis Roem. et Schult.) at several growth states to Benthiocarb (S-(4-chlorobenzyl)N,N-diethyl thiolcarbamate) and the influence of soil type, temperature, water depth and water percolation on the herbicidal effectiveness of Benthiocarb against barnyard grass were determined under submerged conditions. The younger growth stages of barnyard grass, monochoria and slender spikerush were more susceptible than older growth stages. Higher herbicidal effectiveness of Benthiocarb against barnyard grass was observed in the following order: less humus-content soil > higher humus-content, soil, less water percolation > higher water percolation, higher temperature > lower temperature. The behavior of Benthiocarb in water when treated under submerged conditions as well as movement and inactivation in soil were determined using barnyard grass. Although Benthiocarb is decomposed slightly by sunlight under submerged conditions, most of it moved gradually into the soil. Benthiocarb moved downward from surface soil by leaching. The degree of movement in soil is affected by soil type and water leakage but not by temperature. The persistence of Benthiocarb in soil was nearly equal to that of CNP (p-nitrophenyl 2,4,6-trichlorophenyllether). When soil treated by Benthiocarb and thereafter inactivated was retreated with Benthiocarb, persistence was shortened. When Benthiocarb was applied to sterile and non-sterile soil, inactivation occurred sooner in non-sterile soil. Persistence in soil was affected by soil type, amount of water percolation and temperature. Decomposition products derived from Benthiocarb in soil (S-(4-chlorobenzyl)N-ethyl thiolcarbamate, p-chlorobenzoic acid) did not affect the growth of various crops at a rate of 100 g/10 ares (the standard dosage of Benthiocarb is - 200-300 g/10 ares).--Copyright 1977, Biological Abstracts, Inc.

UPWELLING IN A MODEL OF AN INTERMONTANE LAKE,
P. F. Hamblin.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 88-96, 1975. 5 fig., 5 ref.

Descriptors: *Thermocline, *Upwelling, *Model studies, *Mixing, Limnology, Hydraulic models, Wind velocity, Coriolis force, Seiches, Lake breezes, Lakes, *Canada.
Identifiers: *Babine Lake(British Columbia), *Intermontane lakes.

A two-layer linearized analytical model is presented to illustrate the response of an intermontane lake to a suddenly-imposed divergent wind field. Because of the importance of the biological processes occurring in the lake, attention is focussed primarily on the upwelling of the thermocline. Upwelling in such a model occurs not at the boundaries but in the center of the diverging wind, and over a broad central region, whereas the consequent downwelling is confined to the nearshore areas and hence is stronger. The thermocline does not have a single peak but is binodal. These features have been identified in a summer episode of upwelling in Babine Lake (British Columbia). As a consequence of the earth's rotation, the thermocline topography is rotated to the right of the wind stress in a large intermontane lake. The analytical model described is based on a two-layer inviscid equation of motion where the depth laws in the upper layer and the lower layer are elliptic in plan and parabolic in cross section. A discussion of the results of the model's application includes graphical descriptions of the displacement of the thermocline of the model lake from the initial state over four time periods, the celocity field in the upper layer as a funtion of non-dimensional time, and the same function for the lower layer. (Harris-Wisconsin)

A STUDY OF ENVIRONMENT SANITATION ON THE WELLS IN JUNGNEUNG-DONG AREA, SEOUL, (IN KOREAN),
Korea Univ., Seoul. Coll. of Medicine.
H. Kim, Y. J. Park, K. J. Shin, Y. H. Kim, and K. G. Kim.
Korean Cent J Med 29(1), p 51-56, 1975.

Descriptors: *Water wells, Public health, Asia, Water pollution, Water supply, *Human diseases, Potable water, *Pollutant identification, *Coliforms, *Environmental sanitation.
Identifiers: *Jungneung-Dong(Korea).

Clean water supply is an important factor in the prevention of water borne diseases in Korea and other developing countries. In Seoul, about 10% of inhabitants use untreated well water as the drinking water source. A sanitary survey was carried out on 16 pump wells, 15 lidless wells and 10 springs in the Jungneung-dong area at the foot of Mt. Puk-Ak. Potability was investigated. Average values of the water tested were pH=6.6, KMn04 consumption = 3.36 ppm, hardness of well water = 192.7 and hardness of spring water = 10.1 ppm, respectively. Quantitative analysis for ammonia-N revealed 75.6%, coliform group 73.17% and Cl demand 05.-1.0 ppm in 50% of samples. There was a significant relationship between the ammonia-N positive for coliform group bacilli and ammonia-N.--Copyright 1977, Biological Abstracts, Inc.

USE OF QUANTITATIVE CORRELATIONS BETWEEN MICROORGANISMS FOR RIVER POLLUTION EVALUATION, (IN RUSSIAN),
Ministerstvo Melioratsii i Vodnogo Khozyaistva, Vilnius (USSR).
Z. P. Ambrazene.
Zh Obshch Biol 37 (3); p. 416-426, 1976.

Descriptors: *Microorganisms, Water pollution, Rivers, *Correlation analysis, *Regoession analysis, *Organic matter, *Classification.
Identifiers: Lithuanian-SSR, USSR, Saprobic zones.

Correlation and regression analyses of the data from field studies of water from 33 rivers in the Lithuanian SSR, USSR, revealed close relationships between individual physiological groups of microorganisms participating in the decomposition of organic matter (correlation coefficient r = 0.5-0.9). There were also close correlations between physiological groups of microorganisms and the chemical and hydrobiological indices of the organic matter concentration in water (r = 0.4-0.8). A linear relationship was found between the microbial count and the organic matter concentration. An evaluation system for river pollution using 9 microbiological indices was devised. A classifica-

LIBRARY U. OF I. URBANA-CHAMPAIGN

tion of water pollution in 4 grades (corresponding to 4 saprobic zones) is proposed based on quantitative relationships between individual groups of microorganisms. The proposed classification facilitates assessment of the sanitary-epidemiological condition of a water body and the degree of its pollution with organic substances. --Copyright 1977, Biological Abstracts, Inc.

SOURCES OF NITROGEN AS A WATER POLLUTANT: INDUSTRIAL WASTE WATER,
Institute for Water and Air Pollution Research, Stockholm (Sweden).
L. Landner.
Report IVL B 311, June 1976. 15 p. 8 tab., 16 ref.

Descriptors: *Nitrogen, *Industrial wastes, *Estimating, *Water pollution sources, Foreign countries, United States, California, Pulp wastes, Sulfite liquors, Industries, Metallurgy, Food processing industry, Chemical industry, Mineral industry, Fertilizers.
Identifiers: *Industrial nitrogen sources, *Sweden, Finland, Fertilizer industry.

The few estimates of nation-wide industrial nitrogen discharge sources described in the literature, particularly for Sweden, Finland, the United States, and California, are reviewed and discussed. Sources considered are pulp and paper mills; the fertilizer industry, with emphasis on their nitrogen outputs in Sweden. Detailed measurements indicate that the annual nitrogen discharges in Sweden from the pulp and paper mill industry are 4000 tons; the fertilizer industry 800 tons; the chemical industry 1700 tons; mining, iron and steel industries 2400 tons, totaling 10,400 tons annually from these industrial sources. Estimates for the chemical industry, the textile and leather industry, and the food processing industry are believed to be low, because those industrial effluents discharged to municipal sewage treatment plants are not accounted for. It is estimated that all nitrogen sources, including background, forest and agricultural runoff, and municipal and industrial wastes contribute 132,000 tons a year to Swedish waters. (Auen-Wisconsin)

RELATION BETWEEN THE AMOUNTS OF FERTILIZATION AND LIVESTOCK WASTE ON FIELDS AND THE POLLUTION OF STREAMS FLOWING INTO LAKE KASUMIGAURA: 1. ON THE RELATION BETWEEN THE AMOUNT OF FERTILIZER APPLICATION AND THE SPECIFIC POLLUTION LOADS OF NITROGEN AND PHOSPHORUS IN MAIN STREAMS FLOWING INTO LAKE NISHIURA, (IN JAPANESE),
Ibaraki Univ., Mito (Japan). Faculty of Agriculture.
S. Moriizumi, O. Kazuji, and A. Kikkawa.
Sci Rep Fac Afr-c Ibaraki Univ. 23, p 89-100, 1975.

Descriptors: *Nitrogen, *Phosphorus, *Fertilization, Fertilizers, *Water pollution sources, Agriculture, Wheat, Barley, *Farm wastes, Streams.
Identifiers: *Lake Kasumigaura basin(Japan), Lake Nishiura(Japan).

The character of agriculture in the basin of 14 streams flowing into Lake Kasumigaura and the correlation between fertilizer use per unit area of basin and the specific pollutional load of streams were investigated. The planted area of rice in the Nishiura lake basin is the largest of all crops and occupies 49.1% of total planted areas. In the upland field, the planted areas of wheat and barley are the largest of all crops, and those of wheat and barley in Ichinose stream and Kajinashi stream basin are larger than rice. The amount of fertilizer applied to paddy fields in the Nishiura lake basin contains 55.0% N and 39.0% P. Fertilizer use per basin area of 100 km2 for 1 yr in paddy crops was maximum in the Shintone stream basin and minimim in the Sanno stream basin. Its rate in upland field crops was maximum in the Ichinose stream basin. A negative correlation was found between fertilizer use per unit area of basin for rice crops and the specific pollutional load of streams. Specific pollutional load is low in the streams around which fertilizer use per unit area of basin is high. Pollutional load from paddy field apparently was less than total loads from other sources. The same results were obtained for upland field crops. (See also W77-07569)--Copyright 1977, Biological Abstracts, Inc.
W77-07568

RELATION BETWEEN THE AMOUNTS OF FERTILIZER AND LIVESTOCK WASTE ON FIELDS AND THE POLLUTION OF STREAMS FLOWING INTO LAKE KASUMIGAURA: II. ON THE RELATION BETWEEN LIVESTOCK WASTE PER UNIT AREA OF BASIN AND THE SPECIFIC LOAD OF POLLUTANTS IN MAIN STREAMS FLOWING INTO NISHIURA LAKE BASIN, (IN JAPANESE),
Ibaraki Univ. Mito (Japan). Faculty of Agriculture.
A. Kikkawa, K. Osaki, S. Moriizumi, and T. Yoshida.
Sci Rep Fac Agric Ibaraki Univ 23, p 101-106, 1975.

Descriptors: *Fertilizers, Fertilization, Water pollution sources, *Farm wastes, Cattle, *Nitrogen, *Phosphorus, Wheat, Streams.
Identifiers: Lake Kasumigaura basin(Japan), Lake Nishiura basin(Japan).

Livestock farming in the Kasumigaura lake basin and the relation between livestock head numbers per unit area basin and the specific pollutional load of streams were investigated. Cattle (30,000 head) and swine (2000,000 head) were kept in the Kasumigaura lake basin. In each stream the total head numbers of livestock were maximum in Sakura stream basin and minimum in Sanno stream basin. Livestock waste volume per unit area of basin in tabulated. The value was very large in Ichinose and Hishiki streams basin. A negative correlation was found between livestock waste volume per unit area of basin and the specific load of streams. Livestock waste effect on the specific load of streams was less than other water pollution sources. (See also W77-07568)--Copyright 1977, Biological Abstracts, Inc.
W77-07569

THE CHANGES IN INORGANIC NITROGEN CONCENTRATION OF DRINKING WATER FROM WELLS OVER A TWO YEAR PERIOD IN ANI-MACHI, IBARAKI PREFECTURE, (IN JAPANESE),
Ibaraki Univ., Mito (Japan). Faculty of Agriculture.
K. Nagai, M. Muraoka, and M. Oida.
Sci Rep Fac Agric Ibaraki Univ 23, p 59-64, 1975.

Descriptors: *Potable water, *Nitrogen, Water wells, Water pollution sources, *Nitrates, Nitrites, Hydrogen ion concentration, Ammonium, Water supply, Pollutant identification.
Identifiers: *Ammonium nitrogen, Ani-Machi(Japan), Ibaraki prefecture(Japan).

Nitrate, nitrite, ammomium N and pH values of water drawn from 18 wells were determined about every 2 mo. for 2 yr. from June 1973 to Sept. 1975. The pH values of each sample were almost constant; 16 of the samples were about 6.0 to 6.4 and the other 2 were about 6.5 to 7.0. Nitrate concentrationas high (about 35 to 55 ppmN) in 3 adjoining wells; that of 2 adjoining changed little for 2 yr and that of the rest 35 ppm N) was fairly varied showing considerable decrease in warm seasons. Samples (14) were 10 to > 20 ppm N (5 of them about 20 to 40); only 1 was 5 ppm N. Half of the samples have constant concentrations and the other half showed reductions in Sept. or Oct. Ammonium and Nitrite were hardly ever found.--Copyright 1977, Biological Abstracts, Inc.
W77-07570

AN INVESTIGATION ON THE DISPOSAL OF PIG EXCRETA IN KASUMIGAURA AREA, (IN JAPANESE),
Ibaraki Univ., Mito (Japan). Faculty of Agriculture.
S. Ishizaki, and H. Yahagi.
Sci Rep Fac Agric Ibaraki Univ 23, p 7-12, 1975.

Descriptors: *Farm wastes, Water pollution sources, Waste disposal, Lakes, Waste treatment.
Identifiers: *Japan(Kasumigaura area), *Pig excreta.

The excreta of pigs kept in Kasumigaura area, Japan, is a cause of water pollution in Kasumigaura lake. Transport, storage and treatment are discussed. Excreta are used mostly in farm field but are partly thrown away or permeate underground. Most pig farms have no connection with water pollution, and there is little possibility of pollution in pig farming in upland fields or those situated far from streams.--Copyright 1977, Biological Abstracts, Inc.

THE DISTRIBUTION OF RESIDUAL QUANTITIES OF DDT IN THE ORGANS AND TISSUES OF FISH OF THE KIEV RESERVOIR, (IN RUSSIAN),
Kiev Inst. of Nutritional Hygiene (USSR).
L. R. Polishchuk, and I. N. Matvienko.
Vopr Pitan 1, p 82-83, 1976.

Descriptors: *Pesticide residues, *DDT, Reservoirs, *DDD, *DDE, Fish, Water pollution, Public health, Perch, Pike.
Identifiers: Bream, Roach, Ukrainian-SSR, Zander, *Kiev Reservoir(USSR).

Studies with fish caught in the Kiev Reservoir (Ukrainian SSR, USSR) in the spring and winter periods of 1973-1974 indicated that the content of DDT residues and its metabolites DDE and DDD was greatest in the visceral fat, somewhat less in the gonads and liver, and usually undetected in the muscle. The quantity of the residues was also af-

fected by the weight, and consequently the age of the fish. The DDT content was significantly higher in the predatory fish (pike, zander, perch) than in the nonpredatory ones (roach, beam). (The danger of contaminated food products for humans is mentioned.)--Copyright 1977, Biological Abstracts, Inc.

DEPOSITION OF MINERAL NITROGEN BY RAIN IN THE LAMTO SAVANNA, (IN FRENCH),
Ecole Normale Superieure, Paris (France). Laboratoire de Zoologie.
P. Villecourt.
Rev Ecol Biol Sol 12(4), p 667-680, 1975.

Descriptors: *Nitrogen, Rain, Water pollution sources, Mineralogy, Africa, *Rainfall, *Burning.
Identifiers: *Brush fires, *Ivory-Coast(Lamto Savanna), Pluviometers.

The rainfall on the Lamto Savanna (Ivory Coast) during 1972 and 1973 was collected in pluviometers. They were analyzed colorimetrically for nitric N using the Griess reaction and NH3-N using the Nessler reaction. Monthly and annual averages related to rainfall, the contents and concentrations are presented. Annual deposition of nitric N was about 2.3 kg/ha in 1972. Rainfall was 1300 mm with an average concentration of 0.18 ppm. In 1973, deposition was 1.3 kg/ha, rainfall 1250 mm, and the average concentration was 0.11 ppm. Total NH3-N determined analytically, was 6.5 kg/ha per yr; but this value is considered high. The most probable contribution should be estimated at 3 kg/ha per yr. In these depositions, it is possible to discern the result of leaching of mineral N present in the atmosphere by rain. At the beginning of the rainy season brush fires and heavy showers provide about 70% of the annual deposition of mineral N.--Copyright 1977, Biological Abstracts, Inc.

IN VITRO EFFECT OF ORGANIC NITROGEN AND POTASSIUM ADDITIONS ON NITROGEN MINERALIZATION AND ON EXCHANGES BETWEEN THE MUD AND WATER OF A POND, (IN FRENCH),
Lyon-1 Univ., Villeurbanne (France). Departement de Biologie Vegetale; and Lyon-1 Univ., Villeurbanne (France). Laboratoire de Biologie Animaux et d'Ecologie.
H. Beaupied.
Rev Ecol Biol Soil 12(4), p 657-666, 1975.

Descriptors: *Nitrogen, *Potassium, *Mineralogy, Muds, Ponds, Dissolved solids, *Calcium, Ureas.
Identifiers: Ammonical nitrogen.

The process of exchanges of dissolved elements between the mud and water of a pond and the mineralization of organic N, were studied in tanks in vitro. In the test lots, a migration of K and Ca from mud to water was observed. The only indication of N mineralization was an accumulation of ammonical N in mud as in water. Introduction of urea into the water resulted in a distinct increase in the ratio of K to water. Large quantities of ammoniacal N resulting from heavy mineralization may have freed K from the mud. Ca evolution was modified in comparison with the test lots. K as K2So4 added to the water was rapidly absorbed into sediment. Ca migration from mud to water was slowed down. Ammonic N accumulation was lessened. Copyright 1977, Biological Abstracts, Inc.

CAGE CULTURE OF CHANNEL CATFISH IN A HEATED EFFLUENT FROM A POWER PLANT, THOMAS HILL RESERVOIR,
Missouri Univ.-Columbia. School of Forestry, Fisheries and Wildlife.
T. H. Chen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 327, Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Thesis, May 1976. 90 p, 7 fig, 13 tab, 59 ref, append. OWRT B-039-MO(7), 14-31-0001-3296.

Descriptors: *Thermal pollution, Reservoirs, *Fish farming, *Channel catfish, Heated water, Missouri, *Growth rates, Water temperature, Water pollution effects, Electric powerplants.
Identifiers: *Thomas Hill Reservoir(Mo), *Cage culture(Catfish), Lethal temperature.

Channel catfish were cultured in floating cages in an 88-acre arm of water that received a thermal effluent. Fish were subjected to an average temperature of 33 C in August and 6.1 C in January. Corresponding temperatures in the Control Arm, where fish were also cultured, were 28.9 C in July and 2.8 C in January. The optimum temperature for growth (30 C) was determined experimentally. A growth increment of 236% was obtained for 200 fish at 32.7 C, no mortality was noticed. Fish maintained in the heated water for 2 years showed a mean gain of 872 g (range 861-2, 285 g), survival was 95%. Fish were cultured over winter and showed a significant difference in growth between the two Arms, mortality was 1.5%. There appeared to be no correlation between growth and mortality and stocking densities. The economic feasibility of the cage culture of catfish is discussed. (Witt-Missouri)

ASPECTS OF RESERVOIR-POWER STATION INTERACTIONS: SOME EFFECTS OF HEAT ON PHYSICO-CHEMISTRY, AUFWUCHS ECOLOGY AND PLANKTON METABOLISM,
Missouri Univ.-Columbia. School of Forestry, Fisheries and Wildlife.
G. K. O'Bryan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 326, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Thesis, May 1976. 163 p, 13 fig, 39 tab, 130 ref. OWRT B-039-MO(6), 14-31-0001-3296.

Descriptors: *Thermal pollution, Reservoirs, Limnology, *Periphyton, *Phytoplankton, Primary productivity, *Metabolism, Heated water, Ecology, Physicochemical properties, *Missouri, Water pollution effects, Electric powerplants.
Identifiers: *Thomas Hill Reservoir(Mo).

An investigation of 26 physico-chemical parameters, plankton metabolism, and the accrual, composition and metabolism of Aufwuchs was conducted on a reservoir that received a thermal effluent. The only observed effects attributable to the thermal effluent (other than a slight temperature increase) were a slight increase in turbidity, percent saturation of oxygen and reduced ice cover. The heated effluent had no consistent effect on plankton community metabolism, or on the accrual of Aufwuchs. The Aufwuchs study indicates that short-term studies to characterize the tropic nature of waters, or for pollution surveys, are of questionable value because of variability within the community. THE FORMATION OF A LOCAL POPULATION OF BREAM ABRAMIS BRAMA ORIENTALIS, IN THE HEATED WATER ZONE OF KONAKOVO POWER STATION,
Vserossiiskii Nauchno-Issledovatelskii Institut Prudovogo Rybnogo Khozyaistva, Konakovo (USSR). Upper Volga Div.

LIBRARY U. OF I. URBANA-CHAMPAIGN

G. B. Sappo.
Journal of Ichthyology, Vol. 16(1), 1976, p. 35-45, 9 tab., 1 fig., 31 ref.

Descriptors: Freshwater fish, *Water temperature, *Fish genetics, *Fish physiology, *Fish populations, Fish types, *Thermal power, *Thermal pollution, Thermal power plants, Thermal water, *Warm-water fish, *Water pollution effects, Growth.
Identifiers: Volga River, Bream, Abramis brama, *Morphological changes, *Local population, Ivankovo Reservoir(USSR), *Warm water discharge, *Konakovo Power Station(USSR), Pharyngeal teeth, *Condition factor, Age composition.

Ecological and morphological changes are revealed in the bream, Abramis brama orientalis from various regions. The formation of a local population in the warm water zone of Ivan'kovo reservoirs is discussed. Changes in the structure of the pharyngeal teeth of bream from the zone strongly affected by the warm water discharged from Konakovo power station are recorded. Morphological and ecological features distinguishing bream from the control section allow the assumption that a separate population of this species is forming in the warm water zone. The abundance of this population amounted in 1972 to 1.3 million specimens, aged from 1 to 13 years. (Katz)

PHENALEN-1-ONE: OCCURRENCE IN A FUEL OIL AND TOXICITY TO MICROALGAE,
Texas Univ., Port Aransas. Marine Science Inst.
K. Winters, J. C. Batterton, and C. VanBaalen.
Environmental Science and Technology, Vol. 11(3), 1977, p. 270-272, 2 tab., 2 fig., 13 ref.

Descriptors: Oil, *Oil pollution, *Toxicity, *Algae, *Phytoplankton, *Toxicity, Bioassay, Laboratory tests, *Methodology, Water pollution effects, Spectrophotometry, Biochemistry, *Analytical techniques, Algicides, Cyanophyta, Diatoms, Chlorophyta.
Identifiers: *Microalgae, *Phenalen-1-one, No. 2 fuel oil, *Water soluble fractions, *Wavelength dependency, *Algal culture.

Phenalen-1-one (perinaphthenone) was isolated and characterized from the water soluble fraction of a No. 2 fuel oil. Phenalen-1-one had two very different effects on the growth of microalgae. With blue-green algae there was an abrupt toxicity, independent of wavelength, at 5 ppm. With two green algae toxicity was strongly wavelength dependent. In white light (Daylight fluorescent) 250 ppb was lethal; with this same lamp screened by a sharp-cut yellow filter (530 nm) growth rate was not affected until the concentration reached 10 ppm. The growth inhibition of a diatom by phenalen-1-one was also wavelength dependent, but the concentration required was some twenty fold that for green algae. (Katz)
W77-07106

SOME EFFECTS OF CHANNELIZATION ON THE FISHES AND INVERTEBRATES OF RUSH CREEK, MODOC COUNTY, CALIFORNIA,
California Univ., Davis, Div. of Wildlife and Fisheries Biology.
P. B. Moyle.
California Fish and Game, Vol. 62(3), p. 179-186, 1976. 4 tab., 11 ref.

Descriptors: *Channeling, *Biological communities, *Trout, Flood control, Running water, Dominant organisms, Freshwater fish, *Suckers, Invertebrates, *Biomass, Size, Growth rates, Electrofishing, On-site data collections, Statistics, *California, *Sculpins.
Identifiers: *Species composition, Modoc sucker, Catostomus microps, *Endemic species, Pit sculpin, Cottus pitensis, Rush Creek(Calif).

Channelized and unchannelized sections of the lower 7 km (4.3 miles) of Rush Creek, Modoc County, California were compared to determine the impact of channelization on fish populations, especially those of trout (Salmo gairdneri and S. trutta) and the rare endemic Modoc sucker (Catóstomus microps), and invertebrate populations. Fish were captured with a backpack electrofisher, which provided a representative sample by numbers of the species present, although large fish were more vulnerable to capture than small fish. Channelized sections contained fewer and smaller trout, as well as a lower biomass, than the unchannelized sections. Modoc sucker numbers and biomass were also lower in the channelized sections. Only Pit sculpin (Cottus pitensis) were consistently more numerous in the channelized sections. Overall, total fish biomass in the channelized sections was less than one-third of that in the unchannelized sections. The biomass of invertebrates in the channelized sections was found to be less than one-third of that in the unchannelized sections. The invertebrate species composition of the two areas was also different. (Katz)
W77-07109

THE EFFECT OF TEMPERATURE AND THERMAL DISTRIBUTION ON GLYCOLYSIS IN TWO ROCKFISH SPECIES (SEBASTES),
Occidental Coll., Los Angeles, Calif. Dept. of Biology.
J. Helly, Jr.
Marine Biology, Vol. 37, p. 89-95, 1976. 2 fig., 6 tab., 15 ref.

Descriptors: *Marine fish, *Fish physiology, *Metabolism, *Water temperature, Juvenile fish, Animal metabolism, Fluctuations, *Biochemistry, Chemical analysis, Laboratory tests, On-site data collection, SCUBA diving.
Identifiers: Sebastes mystinus, Sebastes serranoides, Blue rockfish, Olive rockfish, *Glucose metabolism, *Embden-Meyerhof glucose metabolism pathway, *Hexose monophosphate shunt, Tissue samples, *Thermal distribution, *Rockfish.

Studies on the effects of temperature on the activities of Embden-Meyerhof (EM) glycolysis and the hexose monophosphate shunt (HMP) in fishes have dealt mainly with exotic and/or acclimated fishes. This study reports the effects of short-term reductions in temperature on EM and HMP activity in two closely related species of temperature fishes (Sebastes spp.) and its possible relation to the thermal distribution of the species. Thermal distribution data were collected by SCUBA for S. mystinus and S. serranoides in King Harbor, Redondo Beach, California. Activities of the pathways were determined in liver-tissue studies, using glucose-14C and liquid scintillation techniques following the method of Hochachka (1968) with modifications. The data were analyzed by distribution-free methods. Tissue studies indicated HMP activity in both species at lowered temperature (5 degrees C), but only in S. serranoides at 15 degrees C. Results indicate that S. mystinus is capable of instantaneous temperature compensation, possibly related to its tendency to occupy cold waters. (Katz)

RESPONSES TO ODORS BY FINGERLING CUTTHROAT TROUT FROM YELLOWSTONE LAKE,
Western Illinois Univ., Macomb. Dept. of Biological Sciences.
L. A. Jahn.
The Progressive Fish-Culturist, Vol 38(4), p 207-210, 1976. 1 fig, 2 tab, 14 ref.

Descriptors: *Cutthroat trout, *Fish migrations, *Odor, Trout, Juvenile fish, Laboratory tests, *Fish physiology, Training, Statistics, *Fish behavior, *Wyoming.
Identifiers: Osmic, Anosmic, Homing ability, *Yellowstone Lake(Wyo).

Normal, osmic, and anosmic fingerling cutthroat trout were tested for response to an odorous solution of aqueous extract of fingerling cutthroat trout. No statistically significant differences were observed. Some trout were trained, with a reward and punishment system, to respond to an odorous solution of tuna extract. The food-reward trained fish responded strongly after 48 trials but ceased to respond when rendered anosmic. The results of the punishment experiment were inconclusive. (Katz)
W77-07111

RESPONSES TO CRUDE OIL CONTAMINATION BY CRICOTOPUS (CRICOTOPUS) BICINCTUS AND C. (C.) MACKENZIENSIS (DIPTERA: CHIRONOMIDAE) IN THE FORT SIMPSON AREA, NORTHWEST TERRITORIES,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
D. M. Rosenberg, A. P. Wiens, and O. A. Saether.
Journal of the Fisheries Research Board of Canada, Vol 34, p 254-261, 1977. 2 fig, 3 tab, 16 ref.

Descriptors: *Oil pollution, *Diptera, *Artificial substrates, *Larvae, Oil, Water pollution effects, *Benthic fauna, Bioassay, On-site investigations, Algae, Biomass, Biological communities, Dominant organisms, Life cycles, *Canada.
Identifiers: Norman Wells crude oil, *Cricotopus bicinctus, *Cricotopus mackenziensis, Northwest territories.

Cricotopus (Cricotopus) bicinctus (Meigen) and C. (C.) mackenziensis Oliver, two common species of Chironomidae in the Fort Simpson area, N.W.T., were examined for changes resulting from experimental field exposure to Norman Wells crude oil. Larvae of both species were always present in higher numbers on oiled than unoiled artificial substrates but numbers of C. bicinctus increased more quickly than C. mackenziensis in response to the oil. C. mackenziensis larvae occurred in higher numbers than C. bicinctus larvae on unoiled artificial substrates. C. bicinctus tended to dominate C. mackenziensis on oiled artificial substrates. Size of larvae, as measured by head capsule width, was unaffected by increased food supply during periods of maximum algal biomass on oiled artificial substrates. Larvae on oiled artificial substrates apparently produced part of another generation when compared to larvae on unoiled artificial substrates. (Katz)
W77-07113

EFFECT OF MERCURY ON THE SURVIVAL, RESPIRATION, AND GROWTH OF POSTLARVAL WHITE SHRIMP, PENAEUS SETIFERUS,
Texas A and M Univ., College Station. Dept. of Biology.
F. A. Green, Jr., J. W. Anderson, S. R. Petrocelli, B. J. Presley, and R. Sims.
Marine Biology, Vol 37, p 75-81, 1976. 7 tab, 22 ref.

Descriptors: *Mercury, *Toxicity, *Shrimp, Heavy metals, Water pollution effects, Path of pollutants, *Mortality, Juvenile growth stage, Size, Respiration, *Growth rate, *Bioassay, Laboratory tests, *Respiration.
Identifiers: LC50, *Acute toxicity, Chronic exposure, Molting rate, *White shrimp, Penaeus setiferus.

The results of toxicity experiments have shown that a level of 17 ppb ionic mercury is acutely toxic (96-h LC50) to postlarval white shrimp (Penaeus setiferus). In addition, the size of the shrimp, within the range tested (7 to 35 mm) did not significantly alter the toxicity values of mercury to this species. Fifty-seven days pre-exposure to low levels of mercury (0.5 and 1.0 ppb) had no effect on the acute toxicity (96-h LC50) of mercury to the shrimp. The effect of chronic exposure to low

levels of mercury on the respiratory rate, growth, and molting rate of postlarval P. setiferus was studied, and the results showed that 60 days exposure to 0.5 and 1.0 ppb mercury did not significantly affect any of these parameters for the post larvae. (Katz)

KINETICS OF LAMPRICIDE (TFM, 3-TRIFLUOROMETHYL-4-NITROPHENOL) RESIDUES IN MODEL STREAM COMMUNITIES,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
A. W. Maki, and H. E. Johnson.
Journal of the Fisheries Research Board of Canada, Vol 34, p 276-281, 1977. 3 fig, 1 tab, 5 ref.

Descriptors: *Lampreys, *Larvicides, *Pesticide kinetics, Aquatic animals, *Absorption, *Pesticide residues, Water pollution effects, *Path of pollutants, Carbon radioisotopes, Laboratory tests, Aquatic plants, *Kinetics.
Identifiers: *Bioconcentration, Excretion, Rate of uptake, *TFM, 3-trifluoromethyl-4-nitrophenol.

The bioconcentration and elimination rates of lamprey larvicide, 14C-TFM (3-trifluoromethyl-4-nitrophenol), were determined for 20 plant and animal species during experimental lamprey control treatments in six indoor model streams. A two-component curve consisting of a rapid initial uptake rate during the first 2 h followed by a reduced linear rate for the remainder of the 24-h exposure best describes the uptake curve for all species examined. The bioconcentration factors (BCF) ranged from 1.1 to 95.5 for animal components and from 0.7 to 12.2 for the plant species. Macroinvertebrate species with soft, relatively permeable integuments accumulate significantly higher residue concentrations (mean BCF=45.0) than those species with hard chitinized or calcareous exoskeletons (mean BCF=11.9). Rates of uptake during the linear phase range from 0.36 micrograms per gram per hour for the crayfish Orconectes propinquus to 17.9 micrograms per gram per hour for the caddisfly larvae Brachycentrus americanus. Rates of loss of TFM accumulations correlate with water current and substrate associations. The mean half-life of TFM is 17.8 h for riffle species and 105.9 h for pool-dwelling species. Half-life figures vary from 7.2 h for the crayfish to 5295 h for annelid worms. The longer half-lives observed for several pool species suggest continued accumulation of 14C-labeled residues from the organic matter from the pool bottoms. (Katz)

ROLE OF MUSSELS MYTILUS EDULIS IN REMOVAL OF PETROLEUM PRODUCTS FROM SEAWATER (UNDER EXPERIMENTAL CONDITIONS),
Polyarnyi Nauchno-Issledovatelskii i Proektnyi Institut Morskogo Rybnogo Khozyaistva i Okeanografii, Murmansk (USSR).
Y. V. Voyko, and Y. M. Petrov.
Hydrobiological Journal, vol. 11(2), p. 19-24, 1975. 3 fig., 3 tab., 10 ref.

Descriptors: *Oil pollution, *Mussels, *Biodegradation, Oil, *Water pollution effects, Toxicity, Path of pollutants, Laboratory tests, Bioassay, Fluorescence, Oxidation, Methodology.
Identifiers: Bioaccumulation, Bunker fuel oil, Lubricating oil.

The dynamics of behavior of petroleum products in seawater shortly after addition were investigated. The purification of the water by the filter feeder Mytilus edulis was measured. (1) Mussels contribute to removal of petroleum oils from seawater because of their capacity to filter water and excrete pseudofeces with occluded particles of the oil. In this way oil is transferred from the water to the sediments. (2) In tanks with mussels, the water was purified twice as fast as in the control. At water temperature of 3 to 10 degrees C, the oil concentration in the water apparently decreased because of partial oxidation and rise of the oil drops to the surface. (3) The green fluorescence spot on the chromatogram, which appeared 3 weeks after the start of the experiment, was probably an indication that the oxidation of the oil had started. (4) After 3 weeks only 7% of the initial amount of the petroleum oil remained in the tanks with mussels. Of this amount, about 1.4% was deposited by the aquatic organisms on the bottom of the tanks, about 5.6% remained in the surface film, and about 0.2% was still dissolved. (Katz)

THE UTILIZATION OF DISSOLVED FREE AMINO ACIDS BY ESTUARINE MICROORGANISMS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Biology.
C. C. Crawford, J. E. Hobbie, and K. L. Webb.
Ecology. 55(3), p 551-563, 1974.

Descriptors: Bacteria, Algae, Amino acids, Estuaries, Microorganisms, *Carbon, North Carolina, Organic compounds, Chromatography, Pollutant identification, Primary productivity, Water pollution effects, Absorption.
Identifiers: *Pamlico River estuary(NC).

The importance of bacteria in the cycling of C in the Pamlico River, North Carolina, estuary was studied by measuring the rates of intake of organic compounds. Methods allowed analysis with the Michaelis-Menten kinetics equations and both the rates of uptake of dissolved free amino acids (DFAA) and glucose as well as the percentage of C subsequently respired as CO2 were determined. In addition, the concentrations of the amino acids in the water were determined using ion exchange chromatography. Other tests included measurements of primary productivity and of the effects of the other amino acids in the water upon the uptake of 1 amino acid. There was considerable variation in the heterotrophic activity over time and distance probably caused by patchiness in distribution of plankton and dissolved compounds in the water. Although there is some competition between amino acids being taken up, the effect upon kinetics measurements is probably negligible. Mutual inhibition was found between the similar amino acid pairs glutamic acid and aspartic acid, threonine and serine, glycine and alanine and leucine and alanine. Highest V max values were found during the summer months and early fall and ranged from a high of 69.42 micro g C/l.h for alanine in Aug. to less than 0.20 micro g C/l-h for most of the substrates tested in the colder months. The V max values for glucose uptake (0.06-9.64 micro g C/l-h) indicate that this estuarine system is one of the most microbially-active environments tested. The orders of abundance and concentrations of individual amino acids were similar to those reported for other bodies of water. When the natural concentration of a substrate is known the actual velocity of uptake (vn) or flux for that substrate may be found. Flux rates were only 1%-10% of the V max values in the coldest months; the highest values were found in the warmest months. At each experimental concentration of amino acid, a certain amount was taken up, and a percentage of this amount was oxidized to CO2. This percentage was constant for a particular amino acid in spite of varying experimental times, substrate concentrations and temperatures. Failure to correct uptake data for this respiratory loss introduces significant underestimation. The production of particulate material was calculated by correcting total uptake figures for each amino acid by its characteristic respiration percentage.--Copyright 1974, Biological Abstracts, Inc.

COMPARISON OF ARTIFICIAL AND NATURAL SEA WATER AS CULTURE MEDIA FOR JUVENILE LOBSTERS,
California Univ., Davis. Inst. of Marine Resources.
M. L. Gallagher, and W. D. Brown.
Aquaculture, vol. 9, p. 87-90, 1976. 1 fig., 2 tab.

Descriptors: *Lobsters, *Aquiculture, *Water quality, *Growth rates, *Commercial shellfish, *Juvenile growth stage, Laboratory tests, Water temperatures, Statistics, Environmental effects, Weight, Length, Methodology, Sea water.
Identifiers: Artificial seawater, Natural seawater.

Fourth-stage and fifth-stage lobsters were placed in artificial or natural sea water and fed live adult brine shrimp for 90 days. Water quality parameters and temperature were monitored. Carapace length and body weight measurements were made at the end of the experimental periods. In trial one, growth was significantly better ($P<0.05$) in artificial sea water. In trial two, growth in artificial sea water was greater than in natural sea water, although the difference in growth was not significant. It was concluded that artificial sea water is satisfactory medium for culturing juvenile lobsters, and in some cases may result in better growth. (Katz)

OCCURRENCE OF TOXIC BIVALVES IN ASSOCIATION WITH THE BLOOM OF GONYAULAX SP. IN OWASE BAY,
Tokyo Univ. (Japan). Lab. of Marine Biochemistry.
Y. Hashimoto, T. Noguchi, and R. Adachi.
Bulletin of the Japanese Society of Scientific Fisheries, vol. 42(6), p. 671-676, 1976. 3 fig., 1 tab., 14 ref.

Descriptors: *Chromatography, *Toxins, *Dinoflagellates, *Commercial shellfish, Biochemistry, Public health, Red tide, Water pollution sources, Mussels, Clams, Laboratory tests, Bioassay, Chemical analysis, Marine algae, Marine microorganisms, Bays.
Identifiers: *Gonyaulax catenella, Saxitoxin, Tetrodotoxin, *Owase Bay(Japan).

The bloom of a toxic dinoflagellate, tentatively identified as Gonyaulax catenella, occurred in Hikimoto-ura, Owase Bay, on January 26, 1975 for two weeks making bivalves moderately toxic although there were no cases of poisoning. The symptoms induced in mice by intraperitoneal injection of the extracts from the dinoflagellate, mussel and short-necked clam, were very similar to those induced by saxitoxin or tetrodotoxin. The toxic principles in short-necked clams were fractionated and partially purified by using Amberlite IRC-50, activated charcoal and Sephadex G-15. Four toxic components were obtained of which two major components clearly differed from saxitoxin in chromatographic behavior. (Katz)

SEASONAL CHANGES OF INVERTEBRATE POPULATIONS IN THE POLLUTED RIVER MEDLOCK,
Salford Univ. (England). Dept. of Biology.
S. Frost, M. T. L. Chiu, and M. P. Thomas.
Environmental Pollution, Vol 11, p 223-242, 1976. 14 fig, 2 tab, 11 ref.

Descriptors: *Water pollution effects, *Biological communities, *Seasonal, Industrial effluents, Sewage effluents, Flow control, Water treatment, *Water management(Applied), Water chemistry, Recreation, On-site data collections, Sampling, Protozoa, Benthic animals, Salmon, Invertebrates.
Identifiers: Invertebrate population, *River Medlock(Eng).

The biological and chemical condition of the river is indicated by seasonal changes in invertebrate populations in relation to certain prevailing environmental factors. Used as a salmon fishery and road in the early days, the river Medlock became an industrial sewer in the nineteenth/twentieth centuries. Controlled flow and increased effluent control now ensures that environmental changes within the river will encourage biological and chemical recovery. Techniques are outlined which could be used in a monitoring program to detect conditions suitable for increasing the value of the water in relation to country park and associated developments along the banks of the river valley. W77-07121

USE OF QUICKLIME TO INCREASE OYSTER SEED PRODUCTION,
National Marine Fisheries Service, Highland, N.J. Sandy Hook Lab.
C. L. MacKenzie, Jr.
Aquaculture, Vol 10, p 45-51, 1977. 2 fig, 7 ref.

Descriptors: *Oysters, *Aquiculture, *Commercial shellfish, *Pesticides, *Shellfish farming, *Artificial substrates, *Calcium compounds, Juvenile growth stage, Benthos, Predation, On-site investigations, Laboratory tests.
Identifiers: *Calcium oxide, *Oyster spat, *Fouling, Quicklime, Starfish, Asterias forbesi, Oyster drills, Urosalpinx cinerea, Eupleura caudata, Oyster setting frequency.

A single application of quicklime (calcium oxide), spread at a rate of 6.75 metric tons/ha, was used to prepare dormant oyster setting beds for spat production. of 2000 ha in Long Island Sound, Connecticut, 1200 ha had sufficient shells to cover at least 75% of the bottom. However, these shells had a continuous fouling organism layer that would prevent significant oyster setting. Many beds had predator populations of sea stars (Asterias forbesi) and oyster drills (Urosalpinx cinerea and Eupleura caudata). Quicklime cleans the shells by killing fouling organisms, and also controls sea stars and embryonic oyster drills. When the supply of clean shells for annual spreading on the setting beds is limited, use of the quicklime method prepares greater quantities of shells for possible oyster set. (Katz)
W77-07122

SHELL DEFORMITY AMONG SCALLOPS (ARGOPECTEN IRRADIANS LAMARK) CULTURED IN A RECIRCULATING SEAWATER SYSTEM,
Delaware Univ., Lewes. Marine Studies Complex.
C. E. Epifanio.
Aquaculture, Vol 9, p 81-85, 1976. 3 fig, 9 ref.

Descriptors: *Mollusks, *Aquiculture, *Commercial shellfish, *Shellfish farming, *Nutrition requirements, *Marine algae, *Growth rates, Laboratory tests, Diets, Animal physiology, Productivity, *Pathology.
Identifiers: *Bay scallop, *Argopecten irradians, Recirculating seawater system, Shell deformity.

Bay scallops, Argopecten irradians, were held in a recirculating seawater system for 25 weeks and fed a diet consisting of four species of cultured algae. The rate of growth of the shellfish was less than reported for scallops from natural areas, and a gross shell deformity was noted among most of the scallops after 18 weeks of culture. The deformity may have been related to an indequate diet. (Katz)

A NATURAL POLLUTION EXPERIMENT: THE EFFECTS OF A SEWAGE STRIKE ON THE FAUNA OF THE THAMES ESTUARY,
King's Coll., London (England). Dept. of Zoology.
R. Sedgwick, and D. R. Arthur.
Environmental Pollution, Vol 11, p 137-160, 1976. 10 fig, 17 ref.

Descriptors: *Sewage effluents, *Water pollution effects, *Estuarine environment, Water pollution, Sewage treatment, Activated sludge, Mortality, Biological communities, Water quality, Water chemistry, Oxygen sag, On-site data collection, Weather.
Identifiers: *Thames estuary(Eng).

Arising from the withdrawal of labor by a national union, this case history of acute pollution in the Thames estuary in 1970 illustrates the complexity of interacting parameters, and of recovery from the polluted state. It deals with the chemical changes in the estuary, the effects of weather conditions on the hydrological pattern, concomitant with other physical parameters, and on the quantitative distribution of the estuarine fauna in relation to these variables. The effects of the polluting load on the fauna are then assessed by comparing the changes between it and previous years and with that immediately succeeding it. (Katz)

SURVIVAL AND REPRODUCTION OF GAMMARUS SPP. (AMPHIPODA) FOLLOWING SHORT-TERM EXPOSURE TO ELEVATED TEMPERATURES,
New York Univ. Medical Center, N.Y. Inst. of Environmental Medicine.
T. C. Ginn, W. T. Waller, and G. J. Lauer.
Chesapeake Science, Vol 17(1), p 8-14, 1976. 1 fig, 8 tab, 8 ref.

Descriptors: *Amphipods, *Water temperature, *Mortality, Fish food organisms, Thermal pollution, Lethal limits, Water pollution effects, Bioassay, Cooling water, Laboratory tests, Reproduction.
Identifiers: Gammarus, *Latent mortality.

Gammarus spp. (G. daiberi and G. tigrinus) experienced no increased latent mortalities for periods up to 10 days after being exposed to an 8.3 C delta T above an ambient temperature of 25.5 C for periods up to 60 minutes. An 11.1 C delta T above an ambient temperature of 26.5 C resulted in significant reductions in survival in groups of Gammarus spp. exposed for 30 and 60 minutes. No significant mortalities were observed, however, following a 5-minute exposure to the 11.1 C delta T. At an ambient temperature of 11.7 C, gammarus spp. exposed to 16.7 C delta T's for periods up to 180 minutes displayed no increased mortalities 10 days after exposure. A sustained 17-day exposure of Gammarus spp. to a 15.6 C delta T at ambient temperatures of 11.2 to 7.1 C resulted in no increased mortalities and stimulated reproductive behavior. Subsequent reproductive activities were not affected by up to 60-minute exposures of mature Gammarus spp. to an 8.3 C delta T at an ambient temperature of 26.0 C. The same exposure also did not affect the release of young by ovigerous female Gammarus spp. An 11.0 C delta T for 30 minutes resulted, however, in almost no release of young from ovigerous females. DYNAMICS OF STORAGE OF ORGANOCHLORINE POLLUTANTS IN HERRING GULLS,
Wisconsin Univ., Madison. Dept. of Wildlife Ecology.
D. W. Anderson, and J. J. Hickey.
Environmental Pollution, Vol 10, pp 183-200, 1976. 3 fig, 5 tab, 74 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Gulls, Pesticides, Water pollution effects, Path of pollutants, *DDE, *DDT, *Polychlorinated biphenyls, Food chains, Juvenile growth stage, Seasonal, Fluctuations, Laboratory tests.
Identifiers: *Herring gulls, *Bioconcentration, Larus argentatus, Body-burden.

Several organochlorine pollutants were studied over the period of one annual cycle in caged juvenile and wild-collected adult herring gulls (Larus argentatus) from Lake Michigan. Fish, mostly alewives (Alosa pseudoharengus), comprised the major year-round food items in the wild; alewives were also fed to the caged juveniles. Fish residues averaged around 3 mg/kg of p,p'-DDE, 2 mg/kg p,p'DDT + p,p'-TDE, and 2 mg/kg apparent PCBs. Juvenile body-burdens of DDE and PCBs showed a continual buildup after fledging, then a temporary dynamic equilibrium, related only in part to annual lipid deposition. Maximum body-burdens were reached in both juveniles and adults when winter fat deposits were declining prior to the breeding season-followed by a return to dynamic equilibrium. Residues of DDT and TDE followed closely the annual pattern of lipid deposition in both juveniles and adults. Total body-burdens in both age classes were similar after the buildups to equilibrium in juveniles in their eighth month after fledging. Seasonal variations of residues of DDE and PCBs were characterized by two phases in adults and three in juveniles, which gradually assumed the adult cyclic pattern. The maximum body-burdens attained by caged juveniles fed a diet of Lake Michigan alewives were 290 mg/kg DDE, 19 mg/kg DDT + TDE, and 200 mg/kg apparent PCBs. Residues in wild adults at the same time were 300, 4, and 200 mg/kg of the same residues. Apparent PCBs and DDE were highly accumulative, although DDE levels resulted from dietary DDE, as well as conversion from DDT. (Katz)

SURVIVAL OF MAYFLY LARVAE UNDER MINE ACID CONDITIONS,
Ohio Univ., Athens. Dept. of Zoology and Microbiology.
S. Napier, Jr., and W. D. Hummon.
Internationale Revue Gesamten Hydrobiologie, Vol 61(5), p 677-682, 1976. 1 fig, 2 tab, 15 ref.

Descriptors: *Mine acids, *Biological communities, *Mayflies, *Food chains, Mine drainage, Water pollution, Water pollution effects, Toxicity, Mortality, Dragonflies, Predation, Larvae, Hydrogen ion concentration, Feeding rates, Fish food organisms, On-site data collection, Laboratory tests.
Identifiers: Riffle communities.

Mayfly larvae were abundant and diverse in riffle zones of three control streams in southeastern Ohio. But none were found in such zones of three streams having current or past histories of mine acid pollution, despite vegetative recovery of reclaimed land bordering two of the streams. Laboratory studies showed stepwise increases in non-predatory mortality of mayfly larvae with increased mine acidity. Dragonfly larvae predation on mayfly larvae was constant at pH 8.1-4.1, but decreased at pH 3.1 despite tolerance of dragonfly larvae to low pH conditions. Extensive acid mine pollution thus may threaten aquatic biota through removal of food sources or reduced feeding rates as well as through direct mortality. (Katz)
W77-07128

THE DYNAMICS OF METALS IN THE AMERICAN OYSTER, CRASSOSTREA VIRGINICA. II. ENVIRONMENTAL EFFECTS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Environmental Medicine.
J. M. Frazier.
Chesapeake Science, Vol 17, No 3, p 188-197, 1976. 6 fig, 3 tab, 29 ref.

Descriptors: *Metals, *Heavy metals, *Commercial shellfish, *Oysters, *Path of pollutants, *Absorption, *Growth rates, *Manganese, *Iron, *Zinc, *Copper, *Cadmium, Water pollution effects, Seasonal, Fluctuations, *Chesapeake Bay, On-site investigations, Bioassay, Biochemistry, Water chemistry.
Identifiers: *Bioaccumulation, Shell thinning.

The dynamics of Mn, Fe, Zn, Cu and Cd in the shell and soft tissues of the American oyster, Crassostrea virginica, were observed in oysters exposed in situ to a metal-contaminated environment from September, 1972 until August, 1973. Zn and Cu accumulated in soft tissues of exposed oysters reaching levels of 4100 micrograms Zn/gm and 450 micrograms Cu/gm compared to 1700 micrograms Zn/gm and 60 micrograms Cu/gm for controls (dry weight basis). The relative enhancement of metals in oyster soft tissues exposed to the contaminated environment over controls reflected the pattern of metal contamination in sediments. Although growth of the oysters, as measured by soft tissue dry weight and shell dimensions, was identical, shells of exposed oysters were significantly thinner than controls (16%). Trace metal incorporation into shell was affected with Mn deposition suppressed and Fe, Zn and Cu slightly increased. Uptake of metals by oyster soft tissues was seasonally dependent with rapid uptake occurring in the summer and fall but delayed uptake occurring in the early spring. (See also W76-01938) (Katz)
W77-07129

EFFECTS OF INCREASED WATER TEMPERATURE ON DAPHNIA PULEX,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
D. R. Craddock.
Fishery Bulletin, Vol 74(2), p 403-408, 1976. 1 fig, 5 tab, 11 ref.

Descriptors: *Daphnia, *Water temperatures, *Lethal limits, *Reproduction, Zooplankton, *Thermal pollution, Cooling waters, Water pollution effects, Laboratory tests, Columbia River, Powerplants, Bioassay.
Identifiers: Daphnia pulex, Acclimation.

Techniques were developed to study the effects of increased water temperature on certain zooplankters; specific studies were conducted on Daphnia pulex, an abundant and important zooplankter of the lower Columbia River. Study methods simulated prolonged exposure to constant high temperatures in thermal discharges and short exposures to increased temperatures in condensers of cooling systems. Effects were evaluated on the basis of survival and reproduction for periods ranging from 34 to 90 days. The time to death of 50% of the D. pulex, both mature and young, was less than 24 h at temperatures above 27 degrees C. Temperatures of 27 degrees C and below required an exposure of at least 192 h to cause 50% mortality. The young females were more tolerant of temperature increases than older females. The greatest reproduction by older females was at the control temperature (15 degrees C), whereas reproduction by the young females was low at lower temperatures. No reproduction occurred above 27 degrees C. Two groups of D. pulex (one from the Seattle, Wash., area and the other from the Columbia River) studied at increased temperatures for prolonged periods revealed similar patterns of survival and reproduction, but the Columbia River group appeared less tolerant of increased temperatures. A short exposure (15 min) to increased temperatures up to 30 degrees C had little effect on survival and reproduction. It was concluded that temperatures should not exceed 26 or 27 degrees C for prolonged periods or 30 degrees C for more than 15 min to protect D. pulex populations. (Katz)
W77-07130

PRESENT AND HISTORICAL SPAWNING GROUNDS AND NURSERIES OF AMERICAN SHAD, ALOSA SAPIDISSIMA, IN THE DELAWARE RIVER,
Texas A and M Univ., College Station. Dept. of Wildlife and Fisheries Sciences.
M. E. Chittenden, Jr.
Fishery Bulletin, Vol 74(2), p 343-352, 1976. 1 fig, 2 tab, 42 ref.

Descriptors: *Commercial fish, *Spawning, *Water pollution effects, Anadromous fish, Fish management, Fish barriers, Dams, Fish ladders, Water pollution, Fish migration, Sampling, Fish behavior, *Delaware River.
Identifiers: American shad, Alosa sapidissima, Spawning grounds.

Spawning occurs from late May into July but mainly in a 3-wk period from late May to mid-late June and ends progressively later proceeding upstream. Light intensity seemed to regulate when spawning began each day. Fish selected shallow riffle areas in preference to pool habitat for spawning. Except for the most grossly polluted tidal water, spawning and nursery areas now extend throughout fresh water of the main Delaware and into the East and West branches. The most important spawning grounds and nurseries are now located from Port Jervis, N.Y., to Hancock, N.Y., and extend into the lower East Branch; this has probably been the case since 1910-1920. There has been a fundamental upstream shift in the chief spawning grounds and nurseries since the decline of the Delaware River shad runs, because these historically extended downstream from about Delaware Water Gap, Pa., and included tidal water. Reasons for this shift suggest intrastream homing. Only a small proportion of the historical nursery now contributes to production. Nursery and spawning areas now contribute to production of adults in proportion to their distance from Philadelphia, Pa. The extent of the spawning and nursery area since about 1910-20 has probably expanded and contracted around a core area in the upper Delaware near Hancock. Future prospects of Delaware River shad depend upon water quality in the tidal area and the proposed Tocks Island dam. Extirpation of the remnant runs is a distinct possibility. (Katz)
W77-07131

THE EVALUATION OF TOXIC EFFECTS OF CHEMICALS IN FRESH WATER BY USING FROG EMBRYOS AND LARVAE,
California Univ., Irvine. Dept. of Anatomy; and California Univ., Irvine. Dept. of Developmental and Cell Biology.
G. Greenhouse.
Environmental Pollution, Vol 11, p 303-315, 1976. 1 fig, 7 tab, 21 ref.

Descriptors: *Testing procedures, *Frogs, *Chemical wastes, Bioassay, *Methodology, Embryonic growth stage, Larvae, Water pollution effects, Toxicity, Mortality, Laboratory tests, Laboratory animals, Bioindicators.
Identifiers: Leopard frog, Rana pipiens, South African clawed toad, Xenopus laevis, Amines.

The objective was to establish a pollutant test system using embryos and larvae of frogs. Two species of frog served as test animals: Rana pipiens, the leopard frog; and Xenopus laevis, the South African clawed toad. The system was directed at assaying the effects of environmental pollutants resulting from US Air Force Operations on viability and development of the test species. Efforts focused on determination of lethal and teratogenic levels of compounds specified by the Air Force. Work performed using the above test system to screen two groups of compounds is described. Group one consisted of three amines, N-phenyl-oc-naphthylamine, octyl-phenyl-oc-naphthylamine and p,p'dioctyldiphenylamine. Only N-phenyl-oc-naphthylamine was found to have toxic effects on developing frogs. Group two consisted of hydrazine, methylhydrazine, and dimethylhydrazine. All of these latter compounds were toxic to developing frogs. (Katz)

EFFECTS OF PASSAGE THROUGH POWER PLANT COOLING SYSTEMS ON ESTUARINE COPEPODS,
Maryland Univ., Solomons. Chesapeake Biological Lab.
D. R. Heinle.
Environmental Pollution, Vol 11, p 39-57, 1976. 3 fig, 11 tab, 20 ref.

Descriptors: *Water temperature, *Chlorination, *Mortality, *Copepods, Electric powerplants, Pumping, Turbines, Water pollution effects, Toxicity, Estuarine environment, On-site data collection, Sampling, Statistics, Chesapeake Bay, Chlorine, Methodology, *Thermal pollution.
Identifiers: Vital staining techniques.

Vital staining techniques were used to measure mortalities of copepods pumped through three electric power plants located at low-salinity estuarine sites. Elevated temperatures and pumping caused little mortality, while the use of chlorine as a biocide caused extensive mortalities. The three species of copepods sampled seemed to have different sensitivities to the perturbations examined. (Katz)
W77-07134

VARIATIONS IN THE LEAD, ZINC AND CALCIUM CONTENT OF DENDROBAENA RUBIDA (OLIGOCHAETA) IN A BASE METAL MINING AREA,
University Coll. of Wales, Aberystwyth. Dept. of Zoology.
M. P. Ireland, and R. J. Wooton.
Environmental Pollution, vol. 10, p. 201-208, 1976. 3 fig., 2 tab., 15 ref.

Descriptors: *Oligochaetes, *Soil contamination, *Lead, *Zinc, Calcium, *Mining, Seasonal, Fluctuations, Absorption, On-site data collection, Biochemistry, Benthos.
Identifiers: *Bioconcentration, *Bioaccumulation.

A study was made of the concentrations of lead, zinc and calcium in Dendrobaena rubida (Savigny)

LIBRARY U. OF I. URBANA-CHAMPAIGN

taken at different times of the year and at three different sites. Lead levels in earthworms reflected the levels in the soils and the highest concentrations occurred in the winter months. Zinc appeared to be unrelated to soil levels at the site where the level of zinc in the soil was high. At the sites with lower levels of zinc in the soil the lowest concentration of zinc in earthworms was found in November. Earthworm calcium values were inversely proportional to the soil levels but monthly variations were inconsistent. There was a good correlation in earthworms between lead and calcium at the sites with high levels of lead in the soil. The concentration of metal in D. rubida is discussed in relation to seasonal changes, regulation and lead/calcium antagonism. (Katz)
W77-07135

EFFECTS OF BENZENE (A TOXIC COMPONENT OF PETROLEUM) ON SPAWNING PACIFIC HERRING, CLUPEA HARENGUS PALLASI,
National Marine Fisheries Service, Tiburon, Calif. Tiburon Lab.
J. W. Struhsaker.
Fishery Bulletin, vol. 75(1), p. 43-50, 1977. 1 fig., 4 tab., 14 ref.

Descriptors: *Herring, *Fish reproduction, *Oil pollution, Spawning, *Oil wastes, Water pollution effects, Toxicity, Mortality, Fish management, Carbon radioisotope, Laboratory tests, Fish physiology, Statistics, Marine fish.
Identifiers: Clupea harengus pallasi, Benxene, Pacific herring.

When female Pacific herring were exposed to low (parts per billion) levels of benzene for 48 h just prior to their spawning, a significant reduction occurred in survival of ovarian eggs and resultant embryos and larvae through yolk absorption. The reduction in survival of ovarian eggs was approximately 10-25%, for embryos from fertilization to hatching, 26%, and for embryos and larvae through yolk absorption, 43%. Exposure to benzene also induced premature spawning and resulted in aberrant swimming behavior and disequilibrium in adults of both sexes. The maximum accumulation of 14C-labeled benzene and/or metabolites in ovarian eggs (14 times initial concentration in water in 24-48 h; 1.4 microliters per gram from 0.1 microliters per liter) was greater than in later egg and larval stages as measured in other experiments. Conservatively estimating the total reduction in survival in these experiments to be approximately 50% through yolk absorption, it is surmized that the effect of exposing spawning herring to only one toxic component of petroleum could have a significant effect on the population. The fish in these experiments were exposed to relatively high parts per billion levels, but they were exposed for a relatively short period (48 h); it is probable that in the estuary, if chronically exposed over a longer period of time to low parts per billion levels of aromatic compounds, the populations could be seriously affected. When the spawning female herring is compared with other life history stages, we find that the spawning stage is clearly the most sensitive of those tested. If fishes prove generally to be most sensitive to petroleum components during their spawning seasons, fishery management decisions should take this factor into consideration in protecting the resources. (Katz)

OBSERVATIONS ON A PEAT BOG'S ABILITY TO WITHSTAND INCREASING PUBLIC PRESSURE,
University of Wales Inst. of Science and Technology, Cardiff.
F. M. Slater, and A. D. Q. Agnew.
Biological Conservation, vol. 11, p. 21-27, 1977. 2 fig., 1 tab., 18 ref.

Descriptors: *Bogs, *Peat, *Damages, Wetlands, Management, Trafficability, Recreation, Use rates, Burning, On-site investigations, Plant populations.
Identifiers: *Trampling, Rhvnchospora alba, Wales, *Peat bogs.

By following the progress of two sets of footprints on Cors Fochno, a raised peat bog on the west coast of Wales, data were obtained to show that over 60% of the annual damage to the site occurs in a few weeks around Easter and is caused by only 40% of the annual number of visitors. The total yearly displacement caused by the trampling of 1890 visitors on the bog's surface is some 4228 cu m, each constituent print of which takes between 20 and 30 months to disappear. It is suggested that Rhynchospora alba is a plant responsive to trampling and that its increased growth might, at least in part, encourage the spread of fires on to the bog. (Katz)
W77-07139

RED TIDE IN THE UPWELLING REGION OF BAJA CALIFORNIA,
Bigelow Lab. for Ocean Sciences, West Boothbay Harbor, Maine.
D. Blasco.
Limnology and Oceanography, Vol. 22, No. 2, p 255-263, March 1977. 5 fig, 3 tab, NSF GX-33502, GB-18568.

Descriptors: *Red tide, *Dinoflagellates, *Upwelling, Chlorophyll, Carbon, Salinity, Temperature, Water temperature, Phytoplankton, Copepods, Aquatic life, Coasts, Currents(Water), Oceans, Oceanography, Marine biology, *Mexico, Pacific Ocean.
Identifiers: *Baja California.

Predominant organisms in a red water dinoflagellate bloom during the seasonal onset of coastal upwelling off Baja California were Gonyaulax polyedra, Ceratium furca, and Gymnodinium sp. The major part of the chlorophyll and the 14C assimilation in the area were related to the G. polyedra population. The maximum concentration of these organisms was associated with low salinity water of the surface California Current. The dinoflagellates remained in the area during the 20-day cruise, although the vertical stability coefficient was low, with no steep temperature gradient. The high concentrations of small copepods suggest them as major grazers of G. polyedra. (Sims-ISWS)

THE ECOLOGICAL CHEMICAL AND HISTOPATHOLOGICAL EVALUATION OF AN OIL SPILL SITE, PART I: ECOLOGICAL STUDIES,
Maine State Dept. of Marine Resources, Augusta.
R. L. Dow, and J. W. Hurst, Jr.
Marine Pollution Bulletin, Vol. 16(11), 1975, p. 164-166, 6 ref.

Descriptors: *Maine, *Oil pollution, *Oil spills, *Mortalities, Fishkills, *Clams, Mollusks, Water pollution effects, *Commercial shellfish, Marine animals, Marine fisheries, *Aquiculture, *Toxicity, On-site investigation, Sediments, Surveys, Ecology, Estuaries.
Identifiers: *Long Cove(Maine), *Ecological studies, *Soft clam, Mya arenaria, *Commercial clam beds, Biological surveys.

An oil spill into Long Cove, Searsport, Maine, began on 16 March and lasted until at least 30 June 1971. It resulted in immediate and continuing soft clam mortalities which, based on before and after biological surveys, had by August 1974 exceeded 85% of the estimated 50 million market-size clams occupying the area. (See W77-07179 and W77-07180) (Katz)
W77-07178

THE ECOLOGICAL, CHEMICAL AND HISTOPATHOLOGICAL EVALUATION OF AN OIL SPILL SITE, PART II. CHEMICAL STUDIES,
Bowdoin Coll., Brunswick, Maine. Dept. of Chemistry.
D. W. Mayo, C. G. Cogger, and D. J. Donovan.
Marine Pollution Bulletin, Vol. 6(11), 1975, p. 166-171. 2 tab., 3 fig., 2 ref.

Descriptors: *Oil spill, *Oil pollution, Methodology, *Gas chromatography, *Analytical techniques, *Sediments, *Maine, Path of pollutants, *Clams, Animal pathology, Molluscs.
Identifiers: *Soft clams, Mya arenaria, *Gonad tumors, *Petroleum hydrocarbons, Hydrocarbon concentration, Long Cove, Maine, *Number 2 fuel oil, *JP5 jet fuel.

The oil from the March 1971 spill in Long Cove, Searsport, Maine, was identified with the aid of adjacent tank farm samples to be No. 2 fuel oil mixed with JP5 jet fuel. Sediment samples obtained from animal collection sites were analyzed by gas chromatographic procedures and were found to contain significant quantities of petroleum hydrocarbons. (See W77-07178 and W77-07180) (Katz)
W77-07179

THE ECOLOGICAL, CHEMICAL AND HISTOPATHOLOGICAL EVALUATION OF AN OIL SPILL SITE, PART III: HISTOPATHOLOGICAL STUDIES,
National Water Quality Lab., West Kingston, R. I.
M. Barry, and P. P. Yevich.
Marine Pollution Bulletin, Vol. 6(11), 1975, 171-173, 1 tab., 5 fig., 2 ref.

Descriptors: *Maine, *Oil spill, *Water pollution effects, *Toxicity, *Mortality, Animal diseases, *Animal pathology, *Oil pollution, *Clams, Commercial shellfish, Path of pollutants, Toxicity, Laboratory tests.
Identifiers: *Histopathology, *Gonadal tumours, Malignant neoplasms, Soft clams, Mya arenaria, Microscopic examination.

In July 1971 when approximately 25% of the clams in Long Cove, Searsport, Maine, had been killed by the March 1971 oil spill, collections of surviving clams for histological examination were made. These studies were continued through 1974 and revealed a high incidence of gonadal tumours in clams contaminated by the oil. The area of highest oil impact correlated with the highest per cent of tumours. The tumours were found to be malignant neoplasms. (See W77-07178 and W77-07179) (Katz)
W77-07180

FUNDAMENTAL STUDIES ON THE INFLUENCE OF OIL POLLUTION UPON MARINE ORGANISMS I. LETHAL CONCENTRATIONS OF OIL-SPILL EMULSIFIERS FOR SOME MARINE PHYTOPLANKTON, (IN JAPANESE),
Tokyo Univ. (Japan). Dept. of Fisheries.
H. Tokuda, and S. Arasaki.
Bulletin of the Japanese Society of Scientific Fisheries Vol. 43(1), p. 97-102, 1977. 5 tab., 8 ref.

Descriptors: *Oil pollution, *Oil spills, *Emulsifiers, *Surfactants, Water pollution effects, Path of pollutants, *Toxicity, Mortality,

*Marine algae, *Phytoplankton, Bioassay, Biochemistry, Laboratory tests, Growth rates, Bioindicators, *Lethal limit.
Identifiers: *Skeletonema costatum, *Nitzschia closterium, *Chlamydomonas sp., Anti-alga spectrum.

The lethal concentrations of 84 commercially produced oil-spill emulsifiers for marine phytoplankton were determined by culture experiments. The samples of oil-spill emulsifiers were collected in August of 1971 (54 domestic and foreign products), 1973 (12 domestic products, 1974 (14 domestic products) and 1975 (4 foreign products). Among 3 species of phytoplankton used as test oganisms, Skeletonema costatum was the most sensitive, Nitzschia closterium moderately sensitive, and Chlamydononas sp. the least sensitive to the toxicity of oil-spill emulsifiers. The toxicity of oil-spill emulsifiers was reduced year after year due to the improvements in their components. The most recently produced oil-spill emulsifiers did not inhibit the growth of Skeletonema costatum at a concentration of 100 ppm; moreover, some of them allowed the growth of this alga even at a concentration of 10,000 ppm. (See also W77-07182) (Katz)
W77-07181

FUNDAMENTAL STUDIES ON THE INFLUENCE OF OIL POLLUTION UPON MARINE ORGANISMS-II. LETHAL CONCENTRATIONS OF OIL-SPILL EMULSIFIER COMPONENTS FOR MARINE PHYTOPLANKTON, (IN JAPANESE),
Tokyo Univ. (Japan). Dept. of Fisheries.
H. Tokuda.
Bulletin of the Japanese Society of Scientific Fisheries Vol. 43(1), p. 103-106, 1977. 3 tab., 7 ref.

Descriptors: *Oil pollution, *Oil spills, *Emulsifiers, *Surfactants, Water pollution effects, Path of pollutants, Toxicity, Mortality, *Marine algae, *Phytoplankton, *Bioassay, Biochemistry, Laboratory tests.
Identifiers: *Aromatic content, Ester type surfactants, Hydrophobic groups.

The lethal concentrations of solvents (9 samples) non-ionic surfactants (16 samples) used as oil-spill emulsifiers were determined fo two species of marine phytoplankton by culture experiments. Of the test organisms used, Skeletonema costatum was ten times more sensitive than Nitzschia closterium to most of the samples. The toxicity of petroleum solvents was dependent on their aromatic content. The surfactants with hydrophobic groups such as alkyl phenol and secondary alcohol were highly toxic. The ester type surfactants were less toxic than the ether type ones. Also there is some relation between the toxicity and the HLB of non-ionic surfactants. (See also W77-07181) (Katz)
W77-07182

EGG AND LARVAL SURVIVAL OF WHITE SUCKERS (CATOSTOMUS COMMERSONI) AT LOW PH,
Cornell Univ., Ithaca. N.Y. Dept. of Natural Resources.
J. R. Trojnar.
Journal of the Fisheries Research Board of Canada, Vol. 34, p 262-266, 1977. 1 tab., 17 ref.

Descriptors: *Suckers, *Fish eggs, Conductivity, *Hydrogen ion concentration, *Embryonic growth stage, Juvenile fish, Fish physiology, *Acidic water, Mode of Action, *Water pollution effects, *Toxicity, Mortality, Laboratory tests, Bioassay, New York.
Identifiers: *White suckers, Catostomus commersoni, Prolarvae, Acid rains, Abnormalities, Acid lakes, Adirondack mountains.

White sucker (Catostomus commersoni) eggs were incubated in water of high (250 umhos/cm) and low (20 umhos/cm) conductivity with nominal pH ranging from 4.2 to 8.0. At pH 4.5 and below in water of low conductivity no eggs survived to hatching. In high conductivity water at pH 4.5, a few prolarvae hatched but were deformed and soon died. At pH 5.0 and above the total hatch was the same at either conductivity level. However, at pH 5.0 there were body deformities and abnormalities in the vascular system and none of the prolarvae survived to the swim-up stage. At both conductivity levels there was a reduction in swim-up at pH 5.3 compared with the control, but none at pH 5.8. Low pH had a delaying influence on the absorption of the yolk sac. (Katz)
W77-07184

THE DISTRIBUTION AND ECOLOGY OF COMMON MARINE AND ESTUARINE GASTROPODS IN THE DELAWARE BAY AREA,
Delaware Univ., Lewes. Marine Studies Complex.
W. Leathem, and D. Maurer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 302, Price code: A02 in paper copy. The Nautilus, Vol. 89, No. 3, p. 73-79, 1975. 47 ref.

Descriptors: *Gastropods, *Mollusks, *Invertebrates, Distribution Patterns, Aquatic life, Aquatic animals, Estuaries, Systematics, *Benthos, *Classification, Benthic fauna, Ecological distribution, *Delaware Bay, Bays.

A number of taxonomic surveys were conducted in the Delaware Bay area, primarily focusing on the benthic ecology. a synthesis is presented of results from surveys on the distribution and ecology of gastropods in the Delaware Bay region. There were 46 common species of marine and estuarine gastropods, the majority being euryhaline marine species. A few of the species had scattered occurrences in either the true estuarine or stenohaline marine ranges. (Katz)

PREFERRED, AVOIDED, AND LETHAL TEMPERATURES OF FISH DURING RISING TEMPERATURE CONDITIONS,
Virginia Polytechnic Inst. and State Univ. Blacksburg. Dept. of Biology.
D. S. Cherry, K. L. Dickson, Jr., and J. R. Stauffer.
Journal of the Fisheries Research Board of Canada, Vol. 34, p. 239-246, 1977. 1 fig., 3 tab., 23 ref.

Descriptors: *Water temperatures, *Salmonids, *Thermal pollution, *Water pollution effects, Freshwater fish, Perches, Shiners, Sunfishes, Laboratory tests, Statistics, Lethal limit, *Fish behavior, *Fish physiology, *Thermal stress, Thermal water.
Identifiers: Acclimation, *Preferred temperatures, *Avoidance response.

Selected temperatures increased for 15 fish species in a laboratory gradient when acclimated to 3 degree C increments from 12 to 27 degrees C. Temperature preferences exceeded acclimation temperatures between 12 to 27 degrees C for all except the telescope shiner (Notropis telescopus), yellow perch (Perca flavescens), rainbow trout (Salmo gairdneri), brown trout (Salmo trutta), and brook trout (Salvelinus fontinalis). At 30, 33, or 36 degrees C acclimation, preferred temperatures were less than the acclimation temperature. The highest temperature preferences occurred at acclimations of 27, 30, or 33 degrees C. Final temperature preferences were usually greater than 29 degrees C for most centrarchids, above 24 degrees C for most cyprinids, and less than 19 degrees C for salmonids. Avoidance temperatures increased as acclimation temperature increased. Upper avoidances tested at high acclimation temperatures (30-36 degrees C) either equalled or exceeded the 7-day upper lethal temperature limit of the species by 1-2 degrees C, while avoidances were below this upper lethal limit when tested at the acclimation temperature closest to the species' final temperature preference. (Katz)

LABORATORY APPARATUS FOR PROVIDING DIEL TEMPERATURE REGIMES FOR AQUATIC ANIMALS,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
W. A. Wurtsbaugh, and G. E. Davis.
The Progressive Fish-Culturist, Vol. 38, No. 4, p. 198-199, 1976. 1 fig., 3 ref.

Descriptors: *Laboratory equipment, *Water temperature, *Fluctuations, *Diurnal, Laboratory tests, Heated water, Temperature control, Aquaria, Trout, Methodology, Thermal pollution.
Identifiers: *Diel temperature fluctuations.

An easy to use, moderate cost apparatus for the study of effects of diel temperature fluctuations on aquatic organisms was constructed with plywood headboxes, immersion heaters, solenoid valves, timers and insulated aquaria. Warm and cool water flows overlap to avoid abrupt temperature changes. (Katz)
W77-07188

HEINZ BODY HEMOLYTIC ANEMIA IN COHO SALMON (ONCORHYNCHUS KISUTCH) EXPOSED TO CHLORINATED WASTEWATER,
Municipality of Metropolitan Seattle, Wash. Water Quality Lab.
J. A. Buckley.
Journal of the Fisheries Research Board of Canada, Vol. 34, 1977, p. 215-224, 3 tab., 11 fig., 46 ref.

Descriptors: *Bioassay, *Chlorine, *Chlorination, *Sewage, Domestic wastes, *Salmon, Fish diseases, Fish physiology, *Pathology, *Effluents, Methodology, Water quality, *Water pollution effects.
Identifiers: *Hematology, *Fish blood cells, *Heinz body hemolytic anemia, *Coho salmon, *Chlorinated wastewater, Total residual chlorine, Erythrocytes, Pathological erythrocytes, Hemoglobin, *Hematologic changes.

Fingerling coho salmon (Oncorhynchus kisutch) were exposed for 12 wk to various concentrations of treated wastewater containing total residual chlorine (TRCl2) with riverwater diluent under continuous flow conditions. Levels of TRCl1 averaging 0.003-0.05 mg/l resulted in mild to pronounced symptoms of hemolytic anemia, including an increase in numbers of circulating immature erythrocytes, pathological changes in erythrocytes, and a reduction in packed cell volume and hemoglobin levels. In addition, Heinz bodies were formed at the 0.012 and 0.05 mg/l TRCl1 levels. The hematologic changes were attributed to the oxidative nature of TRCl. (Katz)

ACUTE TOXICITY OF ZINC, CADMIUM, AND CHROMIUM TO THE MARINE FISHES, YELLOW-EYE MULLET (ALDRICHETTA FORSTERI C. AND V.) AND SMALL MOUTHED HARDYHEAD (ATHERINASOMA MICROSTOMA WHITLEY),
Victoria Ministry for Conservation, Melbourne (Australia). Marine Pollution Studies Group.
D. S. Negilski.
Australian Journal of Marine and Freshwater Research, Vol. 27 (1976), p. 137-149, 3 tab., 31 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Metals, *Toxicity, Mortality, *Bioassay, Laboratory tests, *Marine fish, *Zinc, *Cadmium, *Chromium, *Juvenile fish, Estuarine fish, Fish, Water pollution effects, Industrial wastes, *Water temperature, *Australia.
Identifiers: LC50, Yellow-eye mullet, Smallmouth hardyhead, *Zinc chloride, *Cadmium chloride, *Incipient lethal level, Static bioassay, Continuous flow bioassay.

In static tests with juvenile mullet, the acute incipient lethal level for zinc was 9 mg/l, the 168-h LC50 value for cadmium was 16 mg/l, and the 96-h LC50 values for tri- and hexavalent chromium were 53 and 24 mg/l respectively; in similar tests with pre-adult hardyhead, the acute incipient lethal level for zinc was 33 mg/l and the 168-h LC50 value for cadmium was 21 mg/l. In continuous-flow tests with mullet the acute incipient lethal level for zinc was 12 mg/l, but incipient lethal levels were not attained for cadmium or chromium; however, the 120-h LC50 value for cadmium and the 96-h LC50 value for hexavalent chromium were 14 and 31 mg/l respectively. In similar tests with hardyhead, incipient lethal levels for zinc and chromium were 37 and 36 mg/l respectively. An acute incipient lethal level for cadmium was not attained, but the 168-h LC50 value was 15 mg/l. Generally, mullet and hardyhead were more sensitive to the acute effects of cadmium, chromium and zinc than other marine and estuarine fishes for which toxicological information is available. Increased temperature also appeared to increase the sensitivity of mullet to the lethal effects of zinc. (Katz)

EVALUATION OF TOXICITY TO THE EARLY ONTOGENY OF FISHES OF SUBSTANCES DISCHARGED INTO A BODY OF WATER,
Moscow State Univ. (USSR). Lab. of Water Toxicology.
O. P. Danil'chenko, and N. S. Stroganov.
Journal of Ichthyology, Vol. 15(2), p. 311-319, 1975. 4 fig., 6 tab., 11 ref.

Descriptors: *Chemicals, Chemical wastes, *Water pollution effects, Water quality, *Toxicity, Mortality, Freshwater fish, Juvenile fish, Fry, Fish eggs, Embryonic growth states, *Fish physiology, Laboratory tests, *Bioassay, Biochemistry, *Zinc, *Lead, Metals.
Identifiers: Antiseptics, Development, *Salicylanilide, *Tetraethyl lead chloride, *Sodium pentachlorophenol.

The effect of a number of antiseptics on the embryonic and early post-embryonic development of the following freshwater teleost fishes is investigated: the pike Esox lucius, the perch Perca fluviatilis, the ruffe Acerina cernua, the roach Rutilus rutilus, the minnow Phoxinus phoxinus, the gudgeon Gobio gobio, the leach Misgurnus fossilis and the spiny loach Cobitis taenia. The degree of toxicity of the substances is assessed from their influence on the early development of these fishes. (Katz)

INSTREAM FLOW REGIMENS FOR FISH, WILDLIFE, RECREATION AND RELATED ENVIRONMENTAL RESOURCES,
Fish and Wildlife Service, Billings, Mont.
D. L. Tennant.
Fisheries, vol. 1, no. 4, p. 6-10, 1976. 6 fig., 2 tab., 5 ref.

Descriptors: *Methodology, Aquatic life, Flow, *Average flow, *Streamflow, Bioassay, Biomass, Water quality, Fisheries, Testing, *Stream fisheries, Environmental effects, *Water management(Applied), *Water allocation(Policy), Water distribution(Applied).
Identifiers: *Instream flow regimens.

A quick, easy methodology was described for determining flows to protect the aquatic resources in both warm water and cold water streams, based on their average flow. Detailed field studies were conducted on 11 streams in 3 states between 1964-1974, testing the 'Montana Method.' This work involved physical, chemical, and biological analysis of 38 different flows at 58 crosssections on 196 stream-miles, affecting both cold and warm water fisheries. The studies revealed that the condition of the aquatic habitat was similar on most of the streams carrying the same portion of the average flow. Ten percent of the average flow was a minimum instantaneous flow recommended to sustain short-term survival habitat for most aquatic life forms. Thirty percent was recommended as a basic flow to sustain good survival conditons for most aquatic life forms and general recreation. 60% provided excellent habitat for most life forms during their primary periods of growth and for the majority of recreational uses. DIPHENAMID REMOVAL FROM WATER AND METABOLISM BY AQUATIC PLANTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Plant Pathology and Physiology.
S. W. Bingham, and R. L. Shaver.
Pesticide Biochemistry and Physiology, vol. 7, p. 8-15, 1977. 9 fig., 23 ref.

Descriptors: *Organic compounds, *Biochemistry, *Algae, *Pesticides, *Metabolism, *Plant physiology, *Aquatic plants, Pondweeds, Water hyacinth, Path of pollutants, Mode of action, Analytical techniques, Water quality.
Identifiers: *Diphenamid, Parrotfeather, White algae, Bioaccumulation, Myriophyllum brasilience, Eichornis crossiper, Ulothrix sp., Oedogonium sp., Glococystis sp., Scenedesmus sp., Potamogeton diversifolius.

Several aquatic plants were effective for removal of N,N-dimethyl-2, 2-diphenyl-acetamide ((14C-) diphenamid) from water and degradation to various metabolites. Parrotfeather (Myriophyllum brasilience L.) and water hyacinth (Eichornis crossiper L.) removed large quantities of diphenamid from water while algae (Ulothrix sp., Oedogonium sp., Glococystis sp., and Scenedesmus sp. mixed culture) and waterthread pondweed (Potamogeton diversifolius Raf.) were less effective in reducing diphenamid concentration in the water. A somewhat stable metabolite in algae, water hyacinth , and parrotfeather was N-methyl-2,2-diphenyl-acetamide. Algae and water hyacinth degraded diphenamid further to unknown products. One of these compounds moved more slowly than N-methyl-2,2-diphenylacetamide on thin-layer chromatography using benzene, n-heptane saturated with water and methanol solvent. While most solvents did not resolve 2,2-diphenylacetic acid from the base, petroleum ether, ethyl ether, and formic acid (50:50:2, v/v/v) was found to move 2,2-diphenylacetic acid further than diphenamid or N-methyl-2,2-diphenylacetamide on thin-layer chromatography. HEAVY METAL POLLUTION IN TRONDHEIMSFJORDEN, NORWAY, AND THE RECORDED EFFECTS ON THE FAUNA AND FLORA,
Kongelige Norske Videnskabers Selskab, Trondheim. Museet.
E. Lande.
Environmental Pollution, vol. 12, p. 187-198, 1976. 1 fig., 3 tab., 17 ref.

Descriptors: *Metals, *Sampling, *Wildlife, *Invertebrates, *Algae, *Birds, *Path of pollutants, Environmental effects, Bioassay, *Cadmium, *Copper, *Iron, *Nickel, *Chromium, *Silver, *Zinc, *Mercury, Analytical techniques, Water pollution sources, Water quality.
Identifiers: *Tissue analysis, *Bioaccumulation.

The extent of heavy metal pollution in Trondheimsfjorden was investigated throughout the period of 1972-73. Samples of invertebrates and seaweeds from the intertidal zone were collected for analysis, and parts of some pelagic and bottom-dwelling fishes were also sampled. Seabirds were collected in the fjord and from adjacent areas. Subsamples from the kidneys, liver, pectoral musculature and eggs (white and yolk) of these birds were analysed. All samples were analysed for cadmium, copper, iron, nickel, chromium, silver, zinc and mercury. Heavy metal pollution was found in two distinct areas of the fjord. The qualitative and quantitative changes in the faunal assemblages of these two areas were described. (Katz)

OFFSHORE OIL AND FISHERY RESOURCES,
New York State Dept. of Environmental Conservation, Delmar. Div. of Marine and Coastal Resources.
A. C. Jensen.
New York Fish and Game Journal, vol. 23, no. 2, p. 138-148, 1976. 1 fig., 2 tab., 27 ref.

Descriptors: *Commercial fishing, *Commercial shellfish, *Shellfish, *Environmental effects, *Oil wastes, Natural resources, *New York, *Oil industry, *Drilling, *Risks, *Fishkill, Marine fisheries, Fisheries, Clams, Oysters, Water pollution effects.
Identifiers: *Offshore oil, Risk potential.

The prospect of petroleum reserves off New York and adjacent states has focused a detailed look at the living marine resources of the area as they might be affected by drilling for the petroleum and by possible oil spills. The volume and value of the harvested portions of the resources and their socio-economic impact are discussed. The information is presented as an aid to the decision-makers who must evaluate the known fishery resources against the unknown petroleum resources. (Katz)
W77-07195

THE RELATIONSHIP BETWEEN CUPRIC ION ACTIVITY AND THE TOXICITY OF COPPER TO PHYTOPLANKTON,
Woods Hole Oceanographic Institution, Mass.
W. Sunda, and R. R. L. Guillard.
Journal of Marine Research, vol. 34, no. 4, p. 511-529, 1976. 2 tab., 8 fig., 25 ref.

Descriptors: *Hydrogen ion concentration, *Diatoms, *Copper, *Growth rate, *Inhibitors, *Chelation, *Algae, *Water chemistry, *Phytoplankton, *Toxicity, *Nutrient requirements, *Ions, Laboratory tests, Primary productivity, Estuaries.
Identifiers: Thalassiosira, Nannochloris.

Culture experiments with the estuarine diatom Thalassiosira pseudonana in highly chelated seawater media demonstrate that growth rate inhibition and copper content of cells are related to cupric ion activity and not to total copper concentration. Cupric ion activity was altered independently of total copper concentration by varying the chelator concentration and the pH. Cellular copper content of 3 to 4 day old cultures followed a hyperbolic relation with cupric ion activity. Copper inhibited growth rate at activities above 3 x 10 to the 11th power M and growth ceased at values above 5 x 10 to the 9th power M. The relation between growth rate inhibition and cupric ion activity was not a simple hyperbolic function. In experiments with the green alga, Nannochloris atomus, growth rate inhibition also was related to cupric ion activity with partial growth rate inhibition occurring in the activity range 4 x 10 to the 11th power to 2 x 10 to the 9th power M. Calculated estimates of cupric ion activity in seawater indicate that natural activi-

ty levels can be inhibitory to these phytoplankton depending on pH and the degree of copper complexation by natural organic ligands. (Katz)

RESPONSES OF THE LICHENS PELTIGERA APHTHOSA AND CETRARIA NIVALIS AND THE ALGA NOSTOC COMMUNE TO SULFUR DIOXIDE, NATURAL GAS, AND CRUDE OIL IN ARCTIC ALASKA,
Louisville Univ., Dept. of Biology.
R. M. Atlas, and E. Schofield.
Astarte, vol. 8, no. 2, p. 53-60, 1976. 7 fig., 1 tab., 17 ref.

Descriptors: *Alaska, *Arctic, *Nitrogen fixation, *Carbon dioxide, *Inhibitors, Sulfur compounds, *Oxygen, *Respiration, *Oil wastes, *Oil, *Algae, *Lichens, Carbon cycle, Photosynthesis, Environmental effects, On-site investigations, Bays.
Identifiers: *Crude oil, *Peltigera, *Cetraria, *Nostoc, Prudhoe Bay(Alas).

The sensitivity of the Arctic populations of the lichens Peltigera aphthosa and Cetraria nivalis and the alga Nostoc commune to three pollutants was determined by measuring rates of nitrogen fixation, carbon dioxide fixation and oxygen consumption. Sulfur dioxide was most inhibitory to carbon dioxide fixation, but did not inhibit oxygen consumption. Prudhoe crude oil severely inhibited both nitrogen and carbon dioxide fixation. Natural gas has a much lesser effect on the test organisms. Lichens appeared to be less sensitive to the pollutants than were the free alga. (Katz)
W77-07197

UPTAKE AND ACCUMULATION OF THE NICKEL ION BY MYTILUS EDULIS,
San Francisco Univ., Calif. Dept. of Biology.
A. R. Friedrich, and F. P. Filice.
Bulletin of Environmental Contamination and Toxicology, vol. 16, no. 6, p. 750-755, 1976. 4 fig., 11 ref.

Descriptors: *Nickel, *Mussels, *Absorption, *Heavy metals, Industrial wastes, Mollusks, Bioindicators, Bioassay, Water pollution effects, *Path of pollutants, Toxicity, Animal physiology.
Identifiers: Bivalves.

Mussels (Mytilus edulis) were exposed to nickel concentrations of 0.018, 0.030, 0.056, and 0.107 mg/l for 1, 2, 3 and 4 weeks. Uptake and accumulation were significant at the two highest concentrations. Another experiment showed significant uptake and accumulation at concentrations of 20, 40 and 80 mg Ni/l after a 96 hour exposure. Byssal threads were secreted only at 20 mg Ni/l. (Katz)
W77-07198

SUBTIDAL AND INTERTIDAL MARINE FOULING ON ARTIFICIAL SUBSTRATA IN NORTHERN PUGET SOUND, WASHINGTON,
Washington Univ., Seattle. Coll. of Fisheries.
C. H. Hanson, and J. Bell.
Fishery Bulletin, Vol. 74, No. 2, p. 387-402, 1976. 5 fig., 1 tab., 25 ref.

Descriptors: *Cooling waters, *Marine animals, *Power plants, Locating, Sites, *Biological communities, Artificial substrates, Invertebrates, Marine algae, On-site investigations, Seasonal, Depth, *Heavy metals, *Washington.
Identifiers: *Marine fouling, Fouling organisms, Copper-nickel alloy, *Puget Sound(Wash).

The design and siting of power plant cooling systems requires detailed information concerning the fouling tendencies of specific organisms on specific construction materials. This study, conducted in the vicinity of Kiket Island, northern Puet Sound, Wash., attempts to provide some of this information. The sessile community characteristics of five materials exposed at three depths and two locations in the subtidal zone, and of one material in the intertidal zone are described. The degree of biofouling was least for copper-nickel alloy and progressively greater for Plexiglas, wood, steel, and concrete. Media decay and biological accumulation was greatest at the near-surface level, decreasing in intensity with increasing depth. The maximum rate of colonization occurred during the late spring (April-June) and early fall (mid-August-October). The present study, an analysis of biofouling, indicates that if the proposed power plant were to be built at Kiket Island, its cooling system intake should be sited in water deeper than 6 m and should have a safe and adequate fouling control scheme. (Katz)
W77-07201

UPTAKE, DISTRIBUTION, AND DEPURATION OF 14C-BENZENE IN NORTHERN ANCHOVY, ENGRAULIS MORDAX, AND STRIPED BASS, MORONE SAXATILIS,
National Marine Fisheries Service, Tiburon, Calif. Tiburon Lab.
S. Korn, N. Hirsch, and J. W. Struhsaker.
Fishery Bulletin, Vol. 74, No. 3, p. 545-552, 1976. 2 fig., 4 tab., 13 ref.

Descriptors: *Marine fish, *Oil pollution, *Path of pollutants, Commercial fish, *Bass, Juvenile fish, Oily water, Water pollution effects, Toxicity, *Absorption, Laboratory tests, Carbon radioisotopes, Fish physiology.
Identifiers: *Benzene, *Northern anchovy, Engraulis mordax, Morone saxatilis, Sub-lethal concentrations, *Bioaccumulation, Tissue samples, Depuration, *Striped bass.

The uptake, distribution, and depuration of water-soluble, monocyclic hydrocarbon contained in petroleum and refined products was studied in two species of marine fish. Mature northern anchovy, Engraulis mordax, and juvenile striped bass, Morone saxatilis, were exposed to sublethal concentrations of 14C-benzene for 48 h. Residues in tissues exhibiting a high lipid content or representing apparent major metabolic sites were measured during the exposure and afterwards when the fish were transferred to clean seawater. Fish exhibited a rapid uptake over a wide range of benzene concentrations in the water column. Accumulation in anchovy was considerably greater than in striped bass. Results indicate that the pathway of hydrocarbons through the liver, gallbladder, intestines, and colon is a major depuration route. Residues were depurated rapidly after cessation of exposure; in striped bass tissues most residues were undetectable by 7 days. (Katz)

ENVIRONMENTAL DEPENDENCE OF MANGANESE AND ZINC IN THE SCALES OF ATLANTIC SALMON, SALMO SALAR (L) AND BROWN TROUT, SALMO TRUTTA (L),
Liverpool Univ. (England). Dept. of Oceanography.
M. I. Abdullah, J. W. Banks, D. L. Miles, and K. T. O'Grady.
Freshwater Biology, Vol. 6, No. 2, p. 161-166, 1976. 3 fig., 2 tab., 11 ref.

Descriptors: *Salmonids, *Atlantic salmon, *Brown trout, *Zinc, *Manganese, *Path of pollutants, Freshwater fish, Smolts, Juvenile fish, Heavy metals, Water pollution effects, Absorption, Water chemistry, Biochemistry.
Identifiers: Fish scales.

Analysis of manganese and zinc concentrations in the scales of salmon and trout from a number of sites showed significant dependence of the levels of these metals in the scales on the levels in the environment. There is some evidence to suggest that in trout scales there is a minimum concentration of zinc above which there is a direct proportion between environmental and scale concentration. It is also possible that the response of trout to environmental zinc differs from that of salmon. (Katz)
W77-07203

APPARENT POTENTIATION OF THE COTTON DEFOLIANT DEF BY METHYL PARATHION IN MOSQUITOFISH,
Mississippi Univ. for Women, Columbus. Dept. of Biology.
D. L. Fabacher, J. D. Davis, and D. A. Fabacher.
Bulletin of Environmental Contamination and Toxicology, Vol. 16, No. 6, p. 716-718, 1976. 1 tab., 3 ref.

Descriptors: *Defoliants, *Insecticides, *Toxicity, *Agricultural chemicals, Water pollution, Water pollution effects, Water pollution sources, Mortality, Laboratory tests, Freshwater fish, Bioassay.
Identifiers: 24 hr. LC50, *Mosquitofish, Gambusia affinis, 48 hr. LC50, *Methyl parathion, Potentiation, Cotton defoliant.

Mosquitofish were treated with 0.5 ppm DEF (a cotton defoliant), 5 ppm methyl parathion (boll weevil insecticide) and a combination of 0.5 ppm DEF and 5 ppm methyl parathion. The observed mortalities were 0%, 8% and 89% respectively. This potentiation or greater-than-additive toxicity effect should be considered when both DEF and methyl parathion are sprayed on the cotton fields. (Katz)

PLANKTONIC INFUSORIA IN TWO LAKES OF THE GORKI OBLAST, (IN RUSSIAN),
Gorkii State Univ. (USSR).
M. A. Petrova, T. P. Smirnova, T. A. Ageeva, and G. V. Khalturina.
Gidrobiol Zh 12(2), p 31-36, 1976.

Descriptors: Lakes, *Biomass, Plankton, *Productivity, *Zooplankton, Water temperature.
Identifiers: *Gorki lakes region(USSR), *Planktonic, Infusoria, USSR.

Data on the number, biomass, generation time and production of plankton infusoria are presented for 2 different lakes in the Gorky Region (Russian SFSR, USSR), Lakes Velikoe and Svjatoe. Differences in species composition and the relative role of infusoria in the zooplankton biomass in both lakes (4.3 and 10.1%, respectively) are given. Biomass and production were similar in the 2 lakes. The propagation rate is high and depends on water temperature.--Copyright 1976, Biological Abstracts, Inc.

WATER QUALITY AND CHEMICAL MODELS,
Harvard Univ., Boston, Mass. Div. of Engineering and Applied Physics.
J. N. Butler.
Environmental Affairs, Vol. 2, No. 2, p. 382-98 (Fall 1972). 1 fig, 1 tab.

Descriptors: *Lakes, *Model studies, *Eutrophication, *Analytical techniques, Theoretical analysis, Aquatic algae, Biochemical oxygen demand, Fishkill, Lake stages, Oxygen requirements, Oxygen, Water quality, Odor-producing algae, Algal toxins, Aquatic life, Cyanophyta, Algal control, Evaluation.
Identifiers: Algal blooms.

A model is any representation of a real system which is easier to manipulate than the real system itself. The more complete and relevant one's mental model of an environmental situation is, the better the decisions will be regarding that situation. A chemical model is one which depends on a detailed understanding of the various factors which may affect a given use for water. The use discussed here is the recreational use of an urban lake. The essential quality parameters are that

LIBRARY U. OF I. URBANA-CHAMPAIGN

swimmers should not contract disease or be poisoned, and that visibility be sufficient to allow rescue of those likely to drown. The most serious problem faced is overfertilization (eutrophication). This can be both an aesthetic nuisance and a cause of fish kill. The key questions are: What important factors cause eutrophication. How many algal blooms be controlld. How may the extent of algal growth be predicted. Approaching these questions from a chemical viewpoint, one is able to propose solutions to correct the problems, yet keep the resource within the purpose intended. It is in this fashion that using a chemical model seems most beneficial. (Moorhouse-Florida)

FATE OF THE ORGANOPHOSPHATE INSECTICIDE PARATHION IN THE FRESHWATER INVERTEBRATES,
Rhode Island Univ., Kingston. Dept. of Pharmacology and Toxicology.
G. P. Carlson, and G. C. Fuller.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-266 711, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1976). 16 p, 2 tab, 43 ref. OWRT A-060-RI(1). 14-34-0001-6041.

Descriptors: *Invertebrates, *Insecticides, *Crayfish, *Snails, *Toxicity, *Pesticide residues, Absorption, Metabolism, Water pollution effects.
Identifiers: *Parathion, Cambarus, Paraoxon, Viviparus malleatus, Metabolites.

The goal was to determine the toxicity and fate of the organophosphate insecticide parathion in the freshwater crayfish Cambarus and snail Viviparus malleatus. The research was designed to measure the toxicity of this pesticide to these species in relation to their ability to take it up, metabolize it to the active metabolite paraoxon and inactive metabolites, principally p-nitrophenol and finally excrete the pesticide and metabolites. The results indicate there seems to be no direct danger to snail due to parathion, but the crayfish is sensitive to parathion at levels so low that they are normally exceeded in ponds adjacent to farms following agricultural spraying with parathion. The direct effect on snails due to parathion spraying is minimal and there appears to be very little accumulation of organophosphate in exposed snail tissues; thus the danger to predator species also appears small. However the consequences of crayfish elimination by organophosphate may be real and need investigation, while accumulation, although being investigated, would not be of importance with toxicity occurring at such a low dose.

ECOLOGICAL STUDIES OF THE BRUSSELS URBAN ECOSYSTEM: CONTRIBUTION 8. FIRST SURVEY OF THE HYDROBIOLOGY OF THE WOLUWE VALLEY IN BRUSSELS, (IN FRENCH),
Brussels Univ. (Belgium). Faculte des Sciences.
J. C. Lamaye.
Bull Soc R Bot Belg 108(2), p 295-314, 1975.

Descriptors: *Ecosystems, *Urbanization, *Eutrophication, *Cyanophyta, *Diatoms, Hydrobiology, Plankton, Ponds, Surveys, Water pollution effects.
Identifiers: *Belgium(Brussels area), *Woluwe River valley(Belgium).

The particular conditions of the Woluwe River, one of the last still flowing through E Brussels (Belgium) were analyzed. A great number of ponds, affected by urban pollution are present in this valley. The chemical conditions and the composition of the planktonic communities were observed during 1 yr in the river and in adjacent ponds. Observations of the annual biocenotic cycle show a progressive eutrophication accompanied by a reduction of the diversity of phytoplankton. Blooming a few species of Cyanophyceae and Diatomeae is characteristic of the hypertrophic ponds.--Copyright 1976, Biological Abstracts, Inc.

STUDY ON RESPIRATORY METABOLISM MODIFICATIONS IN ACARTIA CLAUSI (CRUSTACEA: COPEPODA) POPULATIONS AFTER PASSAGE THROUGH THE COOLING CIRCUIT OF A POWER PLANT,
Centre Universitaire de Luminy, Marseille (France). Laboratoire d'Hydrobiologie Marine; and Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
R. Gaudy.
Marine Biology, vol. 39, p. 179-190, 1977. 2 fig., 6 tab., 27 ref.

Descriptors: *Copepods, *Cooling water, *Respiration, Zooplankton, Power plants, Water temperature, *Thermal pollution, Water pollution, Effects, Animal physiology, Metabolism, Thermal stress.
Identifiers: *Acartia clausi, Respiration-temperature curves.

The respiratory metabolism of the copepod Acartia clausi was studied at different temperatures during an annual cycle. Copepods were collected from intake area, the outlet area, where the heated effluents were discharged with an average of 6C, and a small protected bay directly influenced by the flow of the heated waters. Seasonal variations in respiration intensity were observed, with a spring maximum. Specimens collected from the heated effluents exhibited comparatively reduced metabolism. Q10 varied with temperature and time of year, suggesting seasonal regulation of metabolism. Except in March, where metabolic curves differed markedly according to the origin of the sample (species from the heated effluents displaying a metabolic curve of the summer type), the principal difference in shape of the respiration-temperature curves appeared in the range of 10 to 14C, where reduced respiration was observed in specimens from the heated effluents. When A. clausi from external areas were exposed to artificial thermal stress, they displayed a respiratory metabolism pattern similar to that of specimens sampled from the heated effluents. (Katz)
W77-07305

INFLUENCE OF WETTING TENSION AND IONS UPON SETTLEMENT AND BEGINNING OF METAMORPHOSIS IN BRYOZOAN LARVAE (BOWERBANKIA GRACILIS),
Technische Universitaet, Brunswick (West Germany). Zoologisches Institut.
R. Eiben.
Marine Biology, vol. 37, p. 249-254, 1976. 6 fig., 15 ref.

Descriptors: *Larvae, *Growth stages, Life cycles, *Capillary action, *Surface tension, Surfaces, *Mode of action, *Boundaries(Surfaces), Animal physiology, Interfaces, *Salts, *Zooplankton, Chlorides, Animal physiology, Animal behavior, Water quality, Analytical techniques, Potassium compounds, Magnesium compounds, Cesium.
Identifiers: *Bowerbankia gracilis, *Tissue analysis, Wetting solids.

Settlement and metamorphosis in Bowerbankia gracilis larvae were dependent on the wettability of the substratum. The wettability of a solid was characterized by its specific contact angle, Theta. Larvae settled on solids with angles greater than 17 degrees, but not on surfaces with high wettability properties. The rate of settlement and that of metamorphosis were dependent on the degree of Theta in an all-or-none fashion. Settlement of larvae on high-wetting solids was prevented by high capillary pressure accruing at the point of contact. Metamorphosis was initiated by contractions occurring after adhesion. Application of CsCl or KCl induced such contractions and metamorphosis in free-swimming larvae. MgCl2 prevented the onset of metamorphosis but not adhesion. Two mechanisms were considered for induction of metamorphosis: (1) mechanical stimulation by shearing the cilia at the point of contact, and (2) a chemical stimulation of the cell membrane after application of K+ or Cs+. (Katz)

EFFECTS OF COMBINATION OF TEMPERATURE AND HYDROSTATIC PRESSURE ON ASTERIAS RUBENS,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
H.-G. Neuhoff, and H. Theede.
Kieler Meeresforschungen, Vol 30, No 1, p 32-43, 1975. 4 tab, 5 fig, 30 ref.

Descriptors: *Environmental effects, Animal physiology, *Water temperature, *Hydrostatic pressure, Water pressure, Invertebrates, Enzymes, Zooplankton, Methodology, Laboratory tests, Bioassay, Water pollution effects.
Identifiers: *Asterias, *Starfish.

Small specimens of the starfish Asterias rubens (radius: 5-10 mm) tolerate higher hydrostatic pressures than larger ones (radius: 25-40 mm). Pressure tolerance of this species increases with rising temperature from 5 to 15C. Pressure induced reversible injuries are 'repaired' more quickly at higher temperatures. Irreversible damaged starfishes die more quickly at 15C than at 5C. With decreasing temperature and augmenting hydrostatic pressure the activity of the enzyme Lactate-dehydrogenase of Asterias rubens is increasingly inhibited. (Katz)

INVESTIGATIONS ON THE INFLUENCE OF CRUDE OIL ON SURVIVAL AND OXYGEN CONSUMPTION OF IDOTEA BALTICA AND GAMMARUS SALINUS,
Kiel Univ. (West Germany). Institut fuer Meereskunde.

A. Ponat.
Kieler Meeresforshungen, Vol 31, p 26-31, 1975. 3 fig, 1 tab, 17 ref.

Descriptors: Water pollution effects, *Oil, *Invertebrates, *Crustaceans, *Toxicity, *Respiration, Environmental effects, *Bioassay, *Salinity, Laboratory tests, Oxygen, Oil spills, Water temperature, Animal metabolism.
Identifiers: *Gammarus salinus, *Idotea baltica, *Crude oil, Venezuela crude, Libya crude, Iran crude.

The influence of crude oil from Venezuela, Libya and Iran was observed with respect to Idotea baltica and Gammarus salinus. Prior to the measurements, the animals were spread out on sand and exposed to a 0.1 mm layer of crude oil for four hours. After this period they were transferred back to seawater of 15% salinity at 15C. The mean time of survival for G. salinus varied between one and two days, with the shortest survival in Iran oil and the longest in Venezuelan oil (control value: 31 days). I. baltica showed a greater resistance with a mean survival time of 41 days for Iran oil, 48 days for Venezuelan oil and 51 days for Libya oil (control value: 56 days). At this salinity and temperature, the oxygen consumption of G. salinus was reduced by Iran crude oil to 40% of the normal value and to 70% of the normal value in Idotea. (Katz)

Kieler Meeresforschungen, Vol 30, No 2, p 117-129, 1974. 28 fig, 13 ref.

Descriptors: *Water purification, *Ozone, *Bacteria, *Aquaria, *Pollution abatement, *Oxidation, Water treatment, Oxygen, Methodology, Pesticides, Water quality control, Foaming, Aquiculture, Marine bacteria, Nitrogen compounds, Nitrites, Nitrates.
Identifiers: *Ozonation plants.

The purpose was to determine the effect of a sea water purification system on the concentration of bacteria in the aquarium of the Institut fur Meereskunde. Aquarium water differed from that of the Kiel Fjord, especially in its higher phosphate and nitrate concentrations. Saprophyte counts decreased when water was purified and ozone added. The decrease of bacteria was due to increased surface tension of bubbles producing foam which acted as a collecting agent for pollutants as well as bacteria. The amount of ozone was not enough to cause a germicidal effect. Soluble proteins and pollutants were extracted from the water and poisonous nitrite was converted to nitrate by the plant. Additional experiments indicated that a long period of time was necessary for the germicidal action of a given quantity of ozone in polluted aquarium water. The efficiency of the ozone depended on the oxidizable contents of the organic and inorganic matter. (Katz)

EXPERIMENTAL STUDY OF THE NITROGEN EXCRETION OF BASS (DICENTRARCHUS LABRAX) DURING GROWTH. I. EFFECTS OF TEMPERATURE AND WEIGHT ON THE EXCRETION OF AMMONIA AND UREA,
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
O. Guerin-Ancey.
Aquaculture, Vol 9, p 71-80, 1976. 7 fig, 1 tab, 16 ref.

Descriptors: *Bass, *Juvenile fish, *Water temperature, *Nitrogen compounds, *Ammonia, *Fish physiology, Fry, Weight, Metabolism, *Ureas, Laboratory tests.
Identifiers: Dicentrarchus labrax, Excretion of nitrogen(Bass).

The effects of temperature and body weight on ammonia and urea excretion were examined for fishes acclimated to 12, 14, 16, 18, 20, 22, and 24C. Ammonia and urea excretion rates were very high at the highest temperatures and decreased with decrease in temperature. Between 18 and 24C, ammonia excretion rates were equal while urea excretion rates increased with temperature. The excretion of age groups 0, 1 and 2 was studied; the younger the fishes, the more important were the excretion rates. (Katz)

UPTAKE OF DISSOLVED AMMONIUM AND NITRATE ION BY THE FRY OF COMMON CARP, CRUCIAN CARP AND LOACH FROM SURROUNDING WATER, (IN JAPANESE),
T. Ito.
Bulletin of Freshwater Fisheries Research, Vol 26(1), p 27-33, 1976. 3 fig, 3 tab, 7 ref.

Descriptors: *Ammonia, *Nitrates, *Absorption, Nitrogen compounds, Radioisotopes, Bioassay, Laboratory tests, *Carp, Juvenile fish, Fry, Proteins, Fish physiology, Water pollution effects.
Identifiers: Common carp, Crucian carp, *Loach.

Uptake of ammonium-15N and nitrate-15N from environmental water kept at 23-24.5C was estimated at various concentrations of these substances using carp fry, crucian carp fry and loach fry. 15N was analysed by optical spectrographic method after being converted into nitrogen gas in sealed tube by Dumas' method. All of the fry showed ammonium-15N absorption directly from the water. The rate of 15N-replacement increased exponentially to the concentration of ammonia in the water as well as to the time exposed to labelled ammonia for carp and crucian carp, whereas loach fry absorbed 15N in linear relation and proportially to the concentration in water. 15N was absorbed and no apparent correlation was observed between the rate of replacement and the concentration in water. When the carp fry were returned to water free from labelled ammonia after being exposed for 48 hours, relatively large amounts of 15N were excreted within the first hour, followed by a very slow rate of excretion. More than 50% of absorbed 15N was retained after 48 hours. Appreciable amounts of 15N were found in the fish killed beforehand and exposed likewise to ammonium-15N. The amount, however, was about 1/2 to 1/3 to that of the living carp. (Katz)

PCB CONTENTS IN THE MUSCLE OF MARINE ANIMALS COLLECTED IN THE SEA NEAR HAKODATE (IN JAPANESE),
Hokkaido Univ., Hakodate (Japan). Lab. of Food Hygiene.
M. Takagi, H. Murayama, and S. Soma.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 42(5), p 589-594, 1976. 2 fig, 2 tab, 4 ref.

Descriptors: *Polychlorinated biphenyls, *Path of pollutions, *Absorption, Water pollution, Water pollution effects, Biochemistry, Laboratory tests, On-site data collections, Marine animals, *Chlorinated hydrocarbon pesticides, Pacific Ocean, Public health.
Identifiers: Bioconcentration, Muscle tissue, Fat content.

Concentrations of polychlorinated biphenyls (PCB) were determined in the muscle of 36 species of marine animals collected in the sea near Hakodate in 1973-1975. PCB concentrations in the muscle ranged between 0.01-0.18 ppm, i.e., a maximum value of 0.18 ppm in Tribolodon hakonensis hakonensis, and a minimum value of 0.01 ppm in Osmerus dentex. The muscle PCB contents were high in proportion to the high fat contents in the species of Tribolodon, Sardinops, Trachurus and Pleurogrammus. On the contrary, PCB contents were generally low in proportion to the low fat contents in 26 species of fish. Consequently, the level of PCB concentrations in the muscle of fish in this area was found to be extremely low as compared with that in fish in other polluted areas. (Katz)

PRELIMINARY EXPERIMENT OF COBALT 60 POLLUTION OF A MARINE FOOD CHAIN: RESULTS OF A SINGLE INGESTION,
CEA Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-les Durance (France). Departement de Protectione; CEA Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-les Durance (France). Service de Recherches Toxicologiques et Ecologiques; and CEA Centre d'Etudes Nucleaires de Cadarache, Saint-Paul-les Durance (France). Laboritorie de Radioecologie Continental.
J.-C. Amiard, and C. Amiard-Triquet.
Water, Air and Soil Pollution, Vol 5(2), p 221-229, 1975. 5 tab, 16 ref.

Descriptors: *Cobalt radioisotopes, *Path of pollutants, *Food chains, *Food webs, *Plankton, *Mollusks, *Crabs, Water pollution, Water pollution effects, Radioactivity effects, Public health, Laboratory tests, Bioassay, Biochemistry.

A large accumulation of Cobalt 60 was observed at the level of the primary producer, Navicula sp. (Concentration factors=266-396). After one feeding on contaminated food the primary consumers (Scrobicularia plana, Mollusca, Lamelli-branchia) and secondary consumers (Carcinus maenas, Crustacea) retained a large portion of the cobalt ingested (80-90%). The literature indicates that mammals retain a smaller fraction of the Cobalt 60 ingested than do the marine organisms studied. (Katz)

NUTRIENT TRANSFORMATIONS IN LOUISIANA SALT MARSH SOILS,
Louisiana State Univ., Baton Rouge. Center for Wetlands Resources.
R. D. DeLaune, W. H. Patrick, Jr., and J. M. Brannon.
Sea Grant Publication No LSU-T-76-009, November 1976. Coastal Zone Management Series. 44 p, 19 fig, 4 tab, 59 ref.

Descriptors: *Salt marshes, *Wetlands, *Louisiana, *Nutrients, *Productivity, Soils, Nitrogen, Phosphorus, Coasts, Bays, Seasonal.
Identifiers: Spartina alterniflora, Seasonal variations, Barataria Bay(La), Coastal zone management.

Barataria Bay salt marsh exhibits high productivity. Many chemical and microbiological processes occurring in the marsh directly affect productivity. The soils are more or less permanently saturated or submerged. Seasonal changes in redox potential occur only in the upper 5 cm of the soil profile.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Reduced forms of iron, manganese, nitrogen, and sulfur predominate. The nutrient content of Barataria Bay's organic soils are quite high on a total dry mass basis but can be rather low on a volume basis. Levels of nitrogen are low in the spring when maximum uptake of ammonium by Spartina is occurring. Supplemented nitrogen increased the yield of Spartina by 15%. Not only is productivity increased by added nitrogen, but the content of nitrogen in the plant is also increased. The addition of supplemented phosphorus had no effect on productivity. The phosphorus supply capacity of the soil is high enough to provide an adequate amount for plant growth. (NOAA)

THE EFFECT OF COLLECTOR DISCHARGE WATER FROM RICE FIELDS ON THE ZOOPLANKTON OF SOME KUBAN ESTUARIES, (IN RUSSIAN),
Azovskii Nauchno-Issledovatelskii Institut Rybnogo Khozyaistva, Rostov-na-Donu (USSR).
S. E. Panchenko, and E. S. Proskurina.
Gidrobiol Zh 9(3), p 73-78, 1973.

Descriptors: Water pollution effects, *Biomass, DDT, DDE, *Chlorinated hydrocarbon pesticides, DDD, Estuaries, *Zooplankton, *Pesticide residues, Path of Pollutants, Rice, Irrigation, *Copepods, *Crustaceans.
Identifiers: Alona-rectangula, Brachionus-angularis, Calanipeda-aquae-dulcis, Chydorus-sphaericus, Cyclops-strenuus, Daphnia-pulex, Diaphanosoma-brachyrum, Diaptomus-gracilis, Euchlanis-dilatata, Eucyclops-serrulatus, Eurytemora-velox, Keratella-quadrata, *Kuban(USSR), Moina-rectirostris, Roach, USSR, Zander.

The composition and population of 13 spp. of Rotifera, Copepoda and Cladocera (Brachionus angularis, Euchlanis dilatata, Eurytemora velox, Cyclops strenuus, Chydorus sphaericus, Moina rectirostris, Daphnia pulex, Calanipeda aquae-dulcis, Diaphanosoma brachyrum, Alona rectangula, Diatomus gracilis, Eucyclops serrulatus and Keratella quadrata) were studied from March-Sept. in different estuaries of the Kuban River (USSR) to determine the effects of the discharge from intensively irrigated rice fields in the region. Such pesticides as DDT, DDD, DDE, DDVP 2,2 dichlorovinyl dimethyl phosphate, hexachlorocyclohexane, lindane, propanide and Dipterex were used in the fields in large amounts and polluted soil and waters of the estuaries. A comparison of the seasonal dynamics of 3 estuaries showed that in the Sladkii estuary, which served as the control, there was a summer maximum increase in the zooplankton biomass; the role of C. auaedulcis and the total amount of zooplankton decreased in the Karpievskii estuary in the summer where an inflow of discharge water took place; in the Kurchanskii estuary where there were both an inflow from the rice field with pesticides and an outlet to the sea, the composition of the zooplankton was maintained with the saltwater Calanipeda predominating but the overall zooplankton biomass decreased 4-6 times. The Kuban delta region is one of the main natural procedures of valuable commercial fish such as the zander and the Azov roach; the continued disposal of discharge water into the estuaries will lead to a redistribution of dominant species and a decrease in the food base of these fish in this region.--Copyright 1976, Biological Abstracts, Inc.

A STUDY ON STANDING CROPS IN PHRAGMITES COMMUNIS COMMUNITIES AND THEIR ENVIRONMENTAL FACTORS, (IN KOREAN),
Mokpo Teachers' Coll. (South Korea).
C. S. Kim.
Korean J Bot 18(3), p 129-134, 1975.

Descriptors: *Standing crops, *Humus, *Chlorine, Hydrogen ion concentration, Sea water, Tidal water, Estuaries, Environmental effects.
Identifiers: Korea, *Phragmites-Communis, *Reed communities, *Youngsan River estuary(Korea).

The relationship between biomass of reed communities (P. communis) and several environmental factors as Cl, pH, humus content in soil and depth of seawater was studied. One site had 2 plots: H plot, in the shallows, was not submerged except at full tide or from heavy rainfall; M plot, at medium depth, submerged at every common tide. The other site also had 2 plots: M' plot, at medium depth, submerged about 10 h at each tide, and L plot, in deep seawater submerged at every tide at a bank along the east estuary of the Youngsan River (Korea). The maximum standing crop of the reed community occurred on June 25th: biomass at H, M, M' and L plot were, respectively, 4.65, 3.60, 0.98 and 0.67 kg dry weight/m3. Densities at H, M, M' and L plot were 67, 78, 244 and 333 plants/m2. Net production of the terrestrial parts of the reed community on the outside of the bank were as much as a sixth less than that on the inside, but the density on the outside of the bank was 4 or 5 times higher than that on the inside. The growth of reed plants was inhibited by high Cl, high pH, less humus in soil and submergence in seawater for long periods.--Copyright 1976, Biological Abstracts, Inc.

DYNAMICS OF O2 AND CO2 EXCHANGE, PHOTOSYNTHESIS, AND RESPIRATION IN RIVERS FROM TIME-DELAYED CORRELATIONS WITH IDEAL SUNLIGHT,
Washington Univ., Seattle. Dept. of Chemistry.
J. M. Schurr, and J. Ruchti.
Limnology and Oceanography, Vol 22, No 2, p 208-225, March 1977. 4 fig, 13 tab, 14 ref.

Descriptors: *Oxygen, *Carbon dioxide, *Rivers, *Model studies, Mathematical models, Dissolved oxygen, Photosynthesis, Photosynthetic oxygen, Gases, Transpiration, Light, Solar radiation, Correlation analysis, Analytical techniques, Hydrogen ion concentration.
Identifiers: *Switzerland.

The oxygen exchange constant, photosynthetic rate, and respiration rate for several Swiss rivers were determined, using only the continuous data record of a single oxygen electrode, the measured temperature, and an assumed ideal light intensity curve in conjunction with a simple model rate equation and a novel cross-correlation computational technique. The method can be extended to determine also total carbonate dynamics from continuous pH measurements. For the Aare at Bern in March 1974, the oxygen exchange constant was 0.38/h, the respiration rate was 0.6 mg/liter/h, and the mean photosynthetic rate was 0.28 mg/liter/h. The exchange rate for dissolved (but not hydrated or ionized) CO2 was 0.91 times that for dissolved oxygen, and the ratio of O2 molecules released to CO2 molecules consumed during photosynthesis was about 1.2. FURTHER TRANSITION STATES OF THE BAJA CALIFORNIA UPWELLING ECOSYSTEM,
Brookhaven National Lab., Upton, N.Y. Oceanographic Sciences Div.
J. J. Walsh, T. E. Whitledge, J. C. Kelley, S. A. Huntsman, and R. D. Pillsbury.
Limnology and Oceanography, Vol 22, No 2, p 264-280, March 1977. 11 fig, 3 tab, 37 ref. NSF GB-358804, GX-33502.

Descriptors: *Red tide, *Upwelling, *Phytoplankton, *Crabs, Winds, Circulation, Water circulation, Hydrography, Nutrients, Salinity, Temperature, Water temperature, *Zooplankton, Dinoflagellates, Diatoms, Biomass, Marine biology, Marine plants, Marine microorganisms, Aquatic life, Oceans, Coasts, Oceanography, Pollutant identification.
Identifiers: *Baja California.

Measurements were made of wind, surface circulation, hydrography, nutrients, and phytoplankton and zooplankton rate processes in a time series at 27 N during April 1973. A string of current meters and a towed acoustic body were also used to assess the distribution of subsurface currents and red crabs. The seasonal onset of upwelling had already occurred. Diatoms were initially the dominant primary producers. Two perturbations of the upwelling state were observed in response to relaxation of the winds. A comparison of this study with a preceding one in March 1972 indicated that the rate of upwelling, the nutrient content, and the phytoplankton specific growth rate were about the same in both years. The total productivity and biomass of the phytoplankton were less in 1973, implying that greater grazing stress was associated with a switch from smaller dinoflagellates to larger diatoms. Local temporal variability of upwelling off Baja California is postulated to have led to the replacement of clupeids by the red crab as a facultative herbivore. (Sims-ISWS)

INTERACTION OF TEMPERATURE AND SALINITY ON OXYGEN CONSUMPTION OF THE ESTUARINE CRAB PANOPEUS HERBSTII,
Wake Forest Univ., Winston-Salem, N. C. Dept. of Biology.
R. V. Dimock, Jr., and K. H. Groves.
Marine Biology, Vol 33, 1975, p 301-308, 2 fig, 4 tab, 35 ref.

Descriptors: Environmental effects, Metabolism, *Temperature, *Salinity, *Crabs, *Oxygen, Estuarine environment, Water pollution effects.
Identifiers: Panopeus herbstii, Synergistic effects.

Crabs were acclimated to combinations of 10 and 23 C and 5 and 30% S. Rate of oxygen consumption was measured at 10 and 25 C in salinities of 5, 15, 30, and 40% salinity. Male crabs acclimated to 23 C and 5% S and tested at 25 C had higher rates than females at experimental salinities of 40 and 30% S. No significant differences in oxygen consumption between males and females occurred at other temperature and salinity combinations. An increase in oxygen donsumption upon exposure to low salinity was observed. Adjustments to low temperature following acclimation was also observed but some unpredictable patterns of response were seen. No single hypothesis could be suggested to accout for the temperature and salinity effects on metabolic rate. (Chilton-ORNL)

A CONTRIBUTION TO THE LIFE HISTORY OF THE CUNNER, TAUTOGOLABRUS ADSPERSUS, IN FISHERS ISLAND SOUND, CONNECTICUT,
Lawler, Matusky and Skelly Engineers, Tappan, N. Y.
C. B. Dew.

Chesapeake Science, Vol 17, No 2, June 1976, p 101-113, 8 tab, 3 fig, 34 ref.

Descriptors: Environmental effects, *Life history studies, *Seasonal, Growth rates, Spawning, Sexual maturity, Temperature, Behavior, *Connecticut.
Identifiers: *Cunners, Tautogolabrus adspersus, Fishers Island Sound(Conn).

Length-weight relationships and seasonal changes in condition, age and growth, spawning period, age at maturity and sex ratio, and nocturnal and winter habits of the cunner were studied. No significant differences were observed between length-weight relationships for male and female cunners with gonads and stomach contents removed. A general trend of improving condition from spring through fall was seen. Males grew faster than females with maximum readable age for both sexes being five years. Both male and female cunners matured and spawned when one year old. An overall male to female sex ratio of 2.2:1 was found. Cunners remained active until water temperatures dropped to about 8 C and remained dormant until temperatures rose to 6 or 7 C in the spring. Noctiurnal behavior was characterized by assumption of a tactile resting attitude without a camouflage color pattern and a distinct banding resulting in a camouflage effect when in a relatively unprotected position. (Chilton-ORNL)

SUMMER GROWTH DEPRESSION IN THE STRIPED MULLET, MUGIL CEPHALUS L.,
Texas Univ. at Austin, Port Aransas. Marine Science Inst.
J. J. Cech, Jr., and D. E. Wohlschlag.
Contributions in Marine Science, Vol 19, 1975, p 91-99, 3 tab, 1 fig, 29 ref.

Descriptors: Environmental effects, *Growth rates, Seasonal, Metabolism, Respiration, Food abundance, *Mullets, *Texas, Coasts.

Growth rates of striped mullet along the south Texas coast were studied as part of an investigation of physiological responses to seasonal temperatures throughout the year. Two periods of slow growth were found to occur, one during the colder late autumn and winter months and another during the summer. Food availability should be maximal during the summer months. The summer growth rate depression coincides with observations of pronounced summer depression of active and routine respiratory rate. This implies unknown summertime changes in food assimilation and in biochemical metabolic pathways. (Chilton-ORNL)
W77-07378

RESPONSE OF THE MARINE ANGIOSPERM PHYLLOSPADIX TORREYI TO CERTAIN ENVIRONMENTAL VARIABLES: A PRELIMINARY STUDY,
California Univ., Davis. Dept. of Botany.
F. R. Drysdale, and M. G. Barbour.
Aquatic Botany, Vol. 1, 1975, p 97-106, 1 fig, 4 tab, 19 ref.

Descriptors: Environmental effects, *Growth rates, *Marine plants, Salinity, Light, Temperature, *Growth rates.
Identifiers: Angiosperms, *Phyllospadix torreyi.

Leaf growth rate of Phyllospadix torreyi was studied under both laboratory and field conditions. It is hypothesized that spring growth rate is greater than measured winter growth rate and that the change is triggered by increasing daily incident light energy. In laboratory cultures, optimum growth occurred in sea water concentrations of 29,000 ppm, 100 1m/sq. ft light intensity for 12-h day, at water temperatures of 12-14 C. Although growth declined at lower salinities, lower light intensities, and higher temperatures, the magnitude of decline indicated a broad tolerance range for these three parameters. (Chilton-ORNL)
W77-07379

THE INFLUENCE OF TEMPERATURE ON SCOPE FOR ACTIVITY IN CUTTHROAT TROUT, SALMO CLARKI,
Utah Cooperative Fishery Unit, Logan.
W. P. Dwyer, and R. H. Kramer.
Transactions of the American Fisheries Society, Vol. 104, No. 3, July 1975, p 552-554, 1 fig, 1 tab, 9 ref.

Descriptors: *Environmental effects, *Metabolism, Oxygen, *Temperature, *Cutthroat trout.
Identifiers: Scope for activity(Fish).

Cutthroat trout 13-16 months old and weighing an average of 90 grams were acclimated at 17 C. Metabolic rate estimates were then made at temperatures of 5, 10, 15, 20, and 25 C. Active metabolism was found to be lowest at 5 C and highest at 15 C. Scope for activity ranged from 316 mg 02/kg-h at 5 C to 486 mg 02/kg-h at 24 C. Standard metabolisms were 47, 73, 111, 129 and 117 mg 02/kg-h at 5, 10, 15, 20, and 24 C, respectively. It was concluded that, all factors being equal, the greater the scope for activity, the greater resistance to fatigue and the higher the probability of survival when the limiting factor is physiologically available oxygen. (Chilton-ORNL)
W77-07380

ATTAINMENT OF THE FINAL THERMAL PREFERENDUM IN BROWN BULLHEADS ACCLIMATED TO DIFFERENT TEMPERATURES,
Yale Univ., New Haven, Conn. John B. Pierce Foundation Lab.
L. I. Crawshaw.
Compilations in Biochemistry and Physiology, Vol. 52A, 1975, p 171-173, 2 fig, 1 tab, 9 ref.

Descriptors: Environmental effects, *Temperature, *Behavior, Fish, Thermocline, *Bullheads.
Identifiers: Acclimation, Temperature selection, Brown bullheads, Thermal preferendum.

Brown bullheads were acclimated at 7, 15, 24, and 32 C. After 10-20 days in the temperature acclimation tanks, the fish were placed in a thermal gradient and allowed free selection of the ambient water temperature. Selected temperature was recorded for one to two days. After 10 hours in the gradient, the mean selected temperature of the fish acclimated to 7 and 15 C was 25 C and the temperatures selected by fish acclimated to 24 and 32 C was between 29 and 31 C. Regardless of the acclimation temperature, brown bullheads eventually selected temperatures of 29-31 C, the probable final thermal preferendum for the species. (Chilton-ORNL)

BACTERIOLOGY OF CHESAPEAKE BAY SURFACE WATERS,
Maryland Univ., College Park. Dept. of Microbiology.
T. M. Cook, and C. K. Goldman.
Chesapeake Science, Vol. 17, No. 1, March 1976, p 40-49, 3 fig, 4 tab, 16 ref. NSF-RANN G. I.-29906.

Descriptors: *Bacteriology, *Chesapeake Bay, Seasonal, Temperature, Bacteria, Surface waters, Populations, Water pollution effects, Monitoring, Water temperature.

Selected bacterial counts were monitored at two sites in Chesapeake Bay. During spring warm-up, rising total viable counts peaked at a water temperature of 19 C on May 30. Hydrogen sulfide producers also reached peak levels at 19 C and remained constant during early spring. The fermenter population reached maximum densities on May 5, V. parahaemolyticus remained undetectable until the water temperature reached 21 C. During autumn cooling, the total viable count of the heterotrophic bacterial population fell only slightly but the population changed in composition. A marked decrease was seen in proportion of sme fermentative organisms, hydrogen sulfide producers, and Vibrio parahaemolyticus while no change was seen in coliform densities. (Chilton-ORNL)

THE INFLUENCE OF TEMPERATURE AND TIME OF YEAR ON THE OXYGEN UPTAKE OF THE SEA MUSSEL MYTILUS EDULIS,
Rijksinstituut voor Visserijonderzoek, Texel (Netherlands). Dept. of Shellfish Culture.
C. G. N. de Vooys.
Marine Biology, Vol. 36, 1976, p 25-30, 3 fig, 23 ref.

Descriptors: Environmental effects, *Respiration, *Temperature, Seasonal, *Mussels, Metabolism, *Oxygen.

Cultivated sea mussels collected from cultivation beds in the western part of the Dutch Wadden Sea were studied under conditions as natural as possible. Phytoplankton density and composition used for feeding were similar to that found in coastal waters. A linear increase in oxygen uptake per unit animal weight from about 3 C to a maximum of 20-22 C was found. At higher temperatures oxygen uptake decreased. When spawning and recovery occurred, oxygen uptake was higher than in the autumn at the same water temperatures. A clearly higher oxygen uptake which was noted in summer compared with that in winter was explained by the avoidance of temperature adaptation and acceleration of gametogenesis in this study. (Chilton-ORNL)
W77-07383

THE EFFECT OF SALINITY AND CYCLIC TEMPERATURE ON LARVAL DEVELOPMENT OF THE MUD-CRAB RHITHROPANOPEUS HARRISII (BRACHYURA: XANTHIDAE) REARED IN THE LABORATORY,
Zoologisk Museum, Oslo (Norway).
M. E. Christiansen, and J. D. Costlow, Jr.
Marine Biology, Vol. 32, 1975, p 215-221, 5 fig, 6 tab, 10 ref.

Descriptors: Environmental effects, *Larval growth stage, *Temperature, *Salinity, Laboratory tests, *Crabs.
Identifiers: Mud-crab, Rhithropanopeus harrisii.

Larvae were reared from hatching to first or second stage in temperature-salinity combinations of 5, 20, and 35 % S at 20 to 25 C, 25 to 30 C, and 30 to 35 C, and 25 % S at 20 to 25 C and 30 to 35 C. All salinity-cyclic temperature combinations resulted in survival to the megalops and first stage crabs except 5 % S at 30 to 35 C. 94% survival to the megalops and 90% survival to the first crab stage occurred in 20% S at 20 to 25 C. All other combinations showed a reduction in survival to the first crab stage. Temperature significantly affected the duration of larval stages. Shortest development time was found in 20% S at 30 to 35 C and the longest time in 5% and 35 % S at 20 to 25 C. High percentages of abnormalities occurred in larvae reared in 35% S at all cycles of temperature with the highest percentage occurring at 30 to 35 C. It was concluded that larval development of $. harrisii is strongly influenced by environmental factors and not solely related to genetic differences. (Chilton-ORNL)
W77-07384

INFLUENCE OF LIGHT AND TEMPERATURE ON THE PHOTOSYNTHETIC RATE OF MARINE BENTHIC DIATOMS,
Groningen Rijksuniversiteit (Netherlands). Dept. of Systematic Botany.
F. Colijn, and G. van Buurt.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Marine Biology, Vol. 31, 1975, p 209-214, 4 fig, 20 ref.

Descriptors: Environmental effects, *Photosynthesis, *Light, *Temperature, *Diatoms, Aquatic algae, Benthic flora.
Identifiers: Amphiprora alata.

Investigations which are reported include: (1) light saturation of the photosynthetic rate of suspensions at 6 and 12 C; (2) light saturation of the photosynthetic rate of suspensions of cultured Amphiprora alata cells at 12 C; (3) light saturation of the photosynthetic rate of intact bottom samples at 12 C; (4) relation between temperature and photosynthetic rate of mixed sediment samples. Photosynthetic rate of mixed field populations is saturated by light intensity of 10,000 lux. No photoinhibition was found at higher intensities. Cultures of A. alata exhibited strong photoinhibition at intensities of 10,000 to 60,000 lux. Photosynthetic rate was found to increase approximately 10%/degree C in a range of 4 to 20 C. Epipelic and epipsammic species showed no differences in photosynthetic pattern. (Chilton-ORNL)
W77-07385

LIFE HISTORY PATTERNS IN THE COASTAL SHINER, NOTROPIS PETERSONI, FOWLER,
University of South Florida, Tampa. Dept. of Biology.
B. C. Cowell, and C. H. Resico, Jr.

Descriptors: Environmental effects, *Temperature, *Life history studies, Period of growth, *Shiners, *Florida, *North Carolina, Growth rates.

The coastal shiner in central Florida has a protracted breeding season, rapid growth rate, and probably a one-year life cycle. At the northernmost limit of the species in North Carolina, the breeding season is shorter, growth rates are slower, and the duration of the life cycle is approximately three years. In Florida, spawning occurred in March-September, fecundity ranged from 110-694 mature ova/ female. Young-of-the-year from early spring spawning averaged 33.8 mm in length by late June and reached adult size by October. Later spawned young-of-the-year grew at similar rates and all young-of-the-year reached 59.0 mm by December. (Chilton-ORNL)

BREEDING BIOLOGY OF A NON-DIADROMOUS GALAXIID, GALAXIAS VULGARIS STOKELL, IN A NEW ZEALAND RIVER,
Canterbury Univ., Christchurch (New Zealand). Dept. of Zoology.
P. L. Cadwallader.
Journal of Fish Biology, Vol 8, 1976, p 157-177, 10 tab, 5 fig, 42 ref.

Descriptors: *Reproduction, Environmental effects, Temperature, *Spawning, Fish, Life history studies, Sexual maturity, Eggs, Growth rates, Fecundity.
Identifiers: *New Zealand, Galaxias vulgaris, *Galaxid.

Onset of spawning in Galaxias vulgaris appeared to be temperature-dependent. No females were found to mature in the first year but 95 to 68% of age 0 plus males were mature in consecutive years. Age 0 plus males probably play an important role in adverse conditions by significantly increasing the proportion of ripe males and ensuring fertilization of all eggs. No evidence of pair formation for the purpose of spawning was found, but spawning seemed to be communal to some extent. In mature fish, ovaries represented 23% and testes 11% of somatic weight. Size appeared to determine maturity in males and age appeared to be the determining factor in females. Egg numbers ranged from 284 to 1911 per fish with weight being the best indicator of fecundity. (Chilton-ORNL)

QUALITATIVE AND QUANTITATIVE STUDIES ON THE MEIOFAUNA OF A TROPICAL FRESH WATER STREAM SUBJECT TO TIDAL INFLUENCE, (IN ITALIAN),
Andhra Univ., Waltair (India). Dept. of Zoology.
A. L. N. Sarma, C. G. Swamy, K. V. R. Murthy, and K. V. Rao.
Riv Idrobiol 13(2), p 249-260, 1974.

Descriptors: Ecology, Streams, Tropic, *Bioindicators, *Organic matter, Water pollution, Tides, Brackish water, Estuaries, Aquatic life, *Diptera, *Nematodes, *Oligochaetes.

An ecological study of the meiofauna in a tropical freshwater stream showed that the organic material at certain locations contributes to the enrichment of the environment and animal life. Oligochetes, menatodes and chironomids are abundant in polluted waters and the presence of these forms of life is an indicator of the quality of the environment. The maximum density of living organisms was found at 0-5 cm depth. The numerical density of the fauna compares favorably with that ob frackish waters and of estuary systems. Coarse and sharp sand is inadequate for a prolific development of a faunistic societies. Fine or medium sand, covered with a coating of organic matter, on the other hand, supports a rich growth of life.--Copyright 1977, Biological Abstracts, Inc.

STUDIES ON THE EFFECT OF TEMPERATURE ON THE EGG LAYING OF THREE SPECIES OF CALANOID COPEPODS IN THE LABORATORY (ACARTIA TONSA, TEMORA LONGICORNIS, AND PSEUDOCALANUS ELONGATUS),
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
C. J. Corkett, and F. J. Zillioux.
Bulletin of Plankton Society of Japan, Vol 21, No 2, 1975, p 13-21, 1 fig, 2 tab, 22 ref.

Descriptors: Environmental effects, *Reproduction, *Temperature, *Copepods, Laboratory tests, Eggs, Hatching.
Identifiers: Acartia tonsa, Temora longicornis, Pseudocalanus elongatus.

Of the species studied, Acartia tonsa and Temora longicornis lay single eggs while Pseudocalanus elongatus is a sac-carrying copepod. Temperature was not found to significantly affect the number of eggs in a sac but the sac size (and therefore the number of eggs) appeared to be determined by the size of the female. The average number of eggs produced per female per day by T. longicornis and P. elogatus increased with increasing temperature. It was concluded that sac-carrying copepods are limited in their egg production rate because a new sac cannot be laid until the old one hatches. (Chilton-ORNL)

LIFE HISTORY NOTES FOR A POPULATION OF SLIMY SCULPIN (COTTUS COGNATUS) IN AN ALASKAN ARCTIC STREAM,
Aquatic Environments Ltd., Calgary (Alberta).
P. C. Craig, and J. Wells.
Journal of the Fisheries Research Board of Canada, Vol 33, 1976, p 1639-1642, 2 fig, 2 tab, 12 ref.

Descriptors: *Life history studies, Environmental effects, Temperature, Seasonal, Growth rates, Sexual maturity, Eggs, Spawning, *Sculpins, *Alaska, *Arctic.

Growth, maturity, fecundity, and food habits are described of slimy sculpin in the headwaters of the Chandalar River and the data are compared to accounts of the populations in southern latitudes. Growth was slower in the Chandalar population with the maximum age of 7 year fish seldom exceeding 100 mm in length. Sexual maturity for both sexes was reached at age 3-4 as opposed to age 1-2 for Montreal River populations. The Chandalar fecundity count for females ranging in length from 68-99 mm was 206 eggs with a standard deviation of 66.2. No significant difference was noted in sex ratio. Spawning season was in late May shortly after spring breakup. Chandalar sculpins fed almost exclusively on larvae of stream-dwelling insects. (Chilton-ORNL)
W77-07393

AQUATIC ORGANISM CONTAMINATION BY MERCURY RESIDUES IN THE COATZACOALCOS RIVER ESTUARY, MEXICO,
Universidad Nacional Autonoma de Mexico, Mexico City. Instituto Nacional de Energia Nuclear.
A. P. Baez, R. de Nulman, I. Rosas, and L. C. Galvez.
In: Trace Contaminants of Agriculture, Fisheries and Food in Developing Countries, Internation Atomic Energy Agency, 1976 p 73-79, 5 tab, 8 ref.

Descriptors: *Environmental effects, *Water pollution effects, Industrial wastes, *Mercury, Aquatic animals, Vegetation, Estuaries, *Mexico, Marine animals.
Identifiers: *Coatzoalcos River estuary(Mex).

Mercury residues in the biotic and abiotic elements of the estuary were measured over a two-year period. Highest levels were found in sediments and benthonic organisms. From observations of the Hg levels in the stomach contents, it was concluded that the feeding habits are responsible for the ingestion and accumulation of this metal in the tissues. In vegetation, the highest Hg levels were found in plants growing on the banks of a creek which is the primary receptor of liquid wastes from a chlor-alkali factory. (Chilton-ORNL)
W77-07394

ACCUMULATION AND DISTRIBUTION OF TRACE METALS AND RADIONUCLIDES IN MARINE ORGANISMS (PARTICULARLY TAPES DECUSSATUS L.) IN THE IZMIR BAY AREA, TURKEY,
Aegean Univ., Bornova (Turkey). Marine Biological Lab.; and Aegean Univ., Bornova (Turkey). Dept. of General Zoology.
R. Geldiay, and H. Uysal.
In: Trace Contaminants of Agriculture, Fisheries and Food in Developing Countries, Internation International Atomic Energy Agency, 1976 p 81-85, 2 tab, 1 fig, 9 ref.

Descriptors: *Environmental effects, Absorption, Distribution, *Trace elements, *Radioisotopes, Marine animals, *Metals, Bays, Cadmium, Water pollution effects.
Identifiers: *Tapes decussatus, *Turkey, *Izmir Bay(Turkey).

Concentrations of trace metals in Tapes decussatus were determined in relation to polluted and nonpolluted waters. Cadmium concentrations were higher than the other elements. Concentrations of trace elements were higher in digestive glands, mantle and siphon, gills and palps. Uptake occurred through direct contact with the environment and through the digestive gland. The speed of radioactive uptake increased very slowly after a definite level and the loss occurred slowly after a definite level. (Chilton-ORNL)
W77-07395

DEVELOPMENT OF EGGS AND EMBRYOS OF THE SURF CLAM, SPISULA SOLIDISSIMA, IN SYNTHETIC SEAWATER,
National Marine Fisheries Service, Milford, Conn. Middle Atlantic Coastal Fisheries Center; and National Marine Fisheries Service, Milford, Conn. Milford Lab.
W. D. Cable, and W. S. Landers.
Fishery Bulletin, Vol. 72, No. 1, p 247-249, 8 ref.

Descriptors: Environmental effects, *Growth stages, Embryonic growth stage, *Clams, Salinity, Temperature, Mortality.
Identifiers: Surf clams, Spisula solidissima.

Observations on the development of eggs and embryos were made in salinities of 25 and 30% at 10, 15, and 20 C. Temperatures of 20 C were the optimum for development. This temperature allowed eggs to be reared to the 5-day-old stage with almost 100% survival and no signs of larval abnormality. (Chilton-ORNL)
W77-07396

COMPARATIVE ECOPHYSIOLOGY OF GAMMARIDS (CRUSTACEA: AMPHIPODA) FROM MARINE, BRACKISH AND FRESH-WATER HABITATS, EXPOSED TO THE INFLUENCE OF SALINITY-TEMPERATURE COMBINATIONS. I. EFFECT ON SURVIVAL,
Amsterdam Univ., Netherlands, Dept. of Experimental Biology.
J. Dorgelo.
Hydrobiological Bulletin Netherlands, Vol. 8, No. 1 and 2, 1974, p 90-108, 4 tab, 4 fig, 110 ref.

Descriptors: *Environmental effects, *Temperature, *Salinity, *Crustaceans, Freshwater, Brackish water, Sea water, Mortality.
Identifiers: *Gammarids, Synergistic effects.

Survival of mature males of three gammarids from different salinity regimes, ranging from marine to limnetic conditions, was established to analyze the primary as well as the interaction effect of salinity and temperature. Salt tolerance is neither favored nor inhibited by temperature interaction in the natural salinity ranges of the species. Increasing temperature influenced survival negatively in all species. C. tigrinus was most susceptible in spring to both salinity and temperature. (Chilton-ORNL)

OXYGEN CONSUMPTION, VENTILATORY FREQUENCY AND HEART RATE OF LAMPREYS (LAMPETRA FLUVIATILIS) DURING THEIR SPAWNING RUN,
Bath Univ. (England). School of Biological Sciences.
P. N. Claridge, and I. C. Potter.
Journal of Experimental Biology, Vol. 63, 1975, p 193-206, 8 fig, 28 ref.

Descriptors: Environmental effects, Respiration, Metabolism, *Oxygen requirements, *Lampreys, *Spawning.

Studies were conducted during the light phase of the photoperiod and at times which corresponded to various stages in upstream migration. Although all three parameters increased during the spawning run, significant differences between sexes were noted only in mature individuals. Regression coefficients for the logarithmic relationship between oxygen consumption and body weight of immature animals were 0.912 at 9.5 C and 0.925 at 16 C. Standard rate of oxygen comsumption and amount of oxygen taken up increased during hours of darkness. Oxygen consumption, ventilatory frequency and, to a lesser extent, heart rate, increased significantly at 9.5 C over the 100-20% range of saturation with air. Below 20% saturation with air, animals did not remain attached by their oral disc for prolonged periods and the ventilatory frequency rose to a maximum of 175 beats/min at 12.5%. Death occurred within 5-8 h after exposure to 7.5%. (Chilton-ORNL)
W77-07399

HEMATOLOGY OF JUVENILE STRIPED BASS, MORONE SAXATILIS (WALBAUM), ACCLIMATED TO DIFFERENT ENVIRONMENTAL CONDITIONS,
California State Dept. of Fish and Game, Rancho Cordova. Water Pollution Control Lab.
L. A. Courtois.
Compilations in Biochemistry and Physiology, Vol. 53A, 1976, p 1-3, 1 tab, 16 ref.

Descriptors: Environmental effects, *Temperature, *Salinity, *Stripped bass.
Identifiers: *Hematology, *Dechlorinated water.

Stripped bass were subdivided into four different groups with each being acclimated to temperature-salinity combinations as follows: (A) Warm Fresh water-dechlorinated city water, temperature 17.5 C plus or minus 0.5 C; (B) Cold fresh water-dechlorinated city water, temperature 10.8 C plus or minus 0.3 C; (C) Warm sea water-bay sea water (30ppt), temperature 17.5 C plus or minus 0.5C; (D) Cold sea water-bay sea water (30 ppt), temperature 10.5 C plus or minus 0.5 C. Results indicated salt water acclimated fish had lower blood parameters serum K and higher serum Na levels than fresh water acclimated fish at similar temperatures. Increased temperature appeared to cause reverse effects in fresh- and salt water-acclimated fish. (Chilton-ORNL)
W77-07400

RESPIRATORY RESPONSES OF GILLICHTHYS MIRABILIS TO CHANGES IN TEMPERATURE, DISSOLVED OXYGEN AND SALINITY,
California State Dept. of Fish and Game, Rancho Cordova. Water Pollution Control Lab.
L. A. Courtois.
Compilations in Biochemistry and Physiology, Vol. 53A, 1976, p 7-10, 5 fig, 21 ref.

Descriptors: Environmental effects, *Respiration, Oxygen, *Temperature, *Salinity, Fish, *Dissolved oxygen.
Identifiers: *Gillichthys mirabilis.

G. mirabilis acclimated to temperature of 28.6C displayed an increased rate of respiration compared to fish acclimated to a temperature of 11.0 C. Fish acclimated to intermediate temperatures displayed intermediate respiration rates. Decreasingly available ambient oxygen resulted in a diminished respiration. Changes in salinity did not appear to modify respiratory rates for the species. (Chilton-ORNL)

SEASONAL CHANGES IN HEMATOLOGY OF RAINBOW TROUT, SALMO GAIRDNERI,
Nevada Univ., Las Vegas. Dept. of Biological Sciences.
J. E. Denton, and M. K. Yousef.
Compilations in Biochemistry and Physiology, Vol. 51A, 1975, p 151-153, 1 tab, 15 ref.

Descriptors: Environmental effects, *Seasonal, *Temperature, *Rainbow trout, Water temperature.
Identifiers: *Hematology, Hematocrit, *Hemoglobin, Serum protein, Mean cell volume, Mean cell hemoglobin, Mean cell hemoglobin concentration, Blood cells.

Five to seven trout varying in age from 11 to 14 months were captured each month from March 1972 to January 1973. In spite of the fact that water temperatures remained constant at 11-13 C, seasonal changes were observed in hemoglobin, hematocrit, serum protein, mean cell volume, mean cell hemoglobin, and mean cell hemoglobin concentration. Diet, metabolic adaptations and activity were suggested as probable causes of these changes and it was concluded that water temperature did not appear to be responsible for variations in hematology in rainbow trout. (Chilton-ORNL)

CULTURE STUDIES ON EUCHEUMA NUDUM J. AGARDH, A CARRAGEENAN PRODUCING RED ALGA FROM FLORIDA,
University of South Florida, Tampa. Dept. of Biology.
C. J. Dawes, J. W. LaClaire, and R. E. Moon.
Aquaculture, Vol. 7, 1976, p 1-9, 4 tab, 1 fig, 17 ref. NOAA Office of Sea Grant No. 04-3-158-45.

Descriptors: Environmental effects, *Laboratory tests, Cultures, *Algae, *Light, *Temperature, *Nutrients, Nitrates, *Growth rates, *Florida, *Rodophyta.
Identifiers: Synergistic effects, Carrageenan, Eucheuma nudun J. Agardh.

Optimum growth conditions for Eucheuma nudum J. Agardh were studied in the laboratory. Plant responses to light, temperature and nutrient levels were monitored. The algae was found to develop high photosynthetic rates when exposed to a combination of moderate temperatures (20-24 C) and light levels (300-600 ft-candles) and to nitrate concentrations of 10-100 times those found under natural conditions. It appeared that synergistic effects exist between various levels of light and temperature and that these factors should be considered in combination. Increased nitrate levels significantly influenced photosynthetic response. (Chilton-ORNL)

CARBON DIOXIDE AND OXYGEN-NITROGEN RATIOS AS FACTORS AFFECTING SALMON SURVIVAL IN AIR-SUPER-SATURATED WATER,
Corvallis Environmental Research Lab., Oreg. Western Fish Toxicology Station.
A. V. Nebeker, G. R. Bouck, and D. G. Stevens.
Transactions of the American Fisheries Society, Vol. 105 (1976), p. 425-429, 2 tab., 1 fig., 14 ref.

Descriptors: *Sockeye salmon, Juvenile fish, *Mortality, Bioassay, Laboratory test, *Supersaturation, *Atmospheric gases, *Oxygen, *Nitrogen, Carbon dioxide, *Fish disease, Fish physiology, Methodology.
Identifiers: Juvenile sockeye salmon, *Oxygen-nitrogen ratios, *Gas bubble disease, Percent saturation.

Juvenile sockeye salmon (Oncorhynchus nerka) were exposed to lethal levels of air-supersaturated water (120 percent, 125 percent, 130 percent total gas saturation) containing different oxygen-nitrogen ratios and different carbon dioxide concentrations. Fish mortality was not signigicantly different at different carbon dioxide levels (1.7 to 22.0 mg/liter C02) when tested at the same total gas saturation concentrations. Total gas saturation levels are much more important than the 02/N2 ratios, as fish mortality will not occur unless total gas saturation exceeds 100 percent, regardless of the 02/N2 ratios. There was a significant decrease in mortality when the ratio of oxygen to nitrogen was increased while holding the total percent saturation constant. Much more extensive and severe signs of gas bubble disease developed at high 02/N2 ratios than at low 02/N2 ratios, indicating that oxygen plays a significant part in forming external emphysema and lesions. (Katz)

EXPERIMENTS ON THE RESISTANCE OF FISH TO RAPID INCREASE IN HYDROSTATIC PRESSURE,
Freiburg Univ. (West Germany). Limnologisches Institut.
W. Lampert.
Journal of Fish Biology, Vol. 8, (1976), p. 381-383, 2 tab., 2 ref.

Descriptors: *Hydroelectric power, Hydrostatic pressure, Freshwater fish, *Reservoirs, Methodology, Juvenile fish, Perches, Laboratory tests, Carp, Rainbow trout, *Bioassays, *Fish physiology.
Identifiers: West Germany, *Hydrostatic pressure increase, *Swim bladders, Grayling, Roach.

In a few hydro-electric pumping stations in the southern Black Forest it has been found that fish occurring in the high lying reservoirs could only arrive there from the river below after an upward transport through the pumping system. As there is a height difference of 400 m to overcome, the fish must withstand a sudden pressure change of 40 atm. To test whether this is actually possible various species of fish were subjected suddenly to a pressure of 50 atm which was then reduced to 1 atm over a period of 10 min. No mortality occurred. Although the pressure shock symptoms exhibited by the different species of fish were variable, all appeared to be perfectly normal 2 h after the experiment. (Katz)
W77-07416

SWIM BLADDER GAS PRESSURE OF COD IN RELATION TO HYDROSTATIC PRESSURE,
Institute of Marine Research, Bergen (Norway).
G. Sandnes, and T. Gytre.
Journal du Conseil, Vol. 134(3), October, 1972, p. 527-532, 2 fig., 8 ref.

Descriptors: *Cod, *Marine fish, *Hydrostatic pressure, *Fish physiology, *Fish behavior, Laboratory tests, Methodology, *Gases, Saturation, Laboratory animals.
Identifiers: Gadus morhua(L.), *Swimbladder, *Swimbladder gas pressure, *Negative pressure.

Buoyant fish near the surface did not show any swim bladder pressure different from the surroundings. At depths of 40 cm buoyant fish from the upper 20 cm of the open aquaria showed negative gas pressure from the surroundin. Under experimental conditions fish were able to maintain a negative pressure in the swimbladder gas in relation to the surrounding hydrostatic pressure. (Katz)

MINERALIZING MICROBIAL ACTIVITY IN LAKE FARO,
Messina Univ. (Italy). Instituto di Idrobiologia.
S. Genovese, and V. Bruni.
Boll Pesca Piscic Idrobiol 30(1), p 39-56, 1975.

Descriptors: Lakes, +Microbiology, *Mineralogy, Nutrients, Lake sediments, Brackish water, *Hydrogen sulfide, *Sulfides, Salts, Cycling nutrients.
Identifiers: *Lake Faro(Italy).

Continuing studies have been carried out in Lake Faro (Italy) on microbial mineralizing activity and on nutrient salt content. The results of new physico-chemical and microbiological observations on water and sediment samples are reported. The intense microbial activity in the brackish-wate environment causes a strong trophism. There is also a significant contribution of allochthonous material. The presence of H2S in Lake Faro determines a complex of specific, biochemical activities in the S cycle.--Copyright 1977, Biological Abstracts, Inc.
W77-07418

COLLECTION OF JUVENILE SALMONIDS FROM TURBINE INTAKE GATEWELLS OF MAJOR DAMS IN THE COLUMBIA RIVER SYSTEM,
Bureau of Commercial Fisheries, Seattle, Wash.
W. W. Bentley, and H. L. Raymond.
Transactions of the American Fisheries Society, Vol. 97 (1968), p. 124-126, 1 tab., 2 fig., 1 ref.

Descriptors: *Columbia River, *Dams, Dam sites, *Anadromous fish, Chinook salmon, Juvenile fish, *Fish migration, *Fish behavior, On-site investigations, Fish population, *Turbines, *Mortality.
Identifiers: Ice Harbor Dam, *Snake River, *Juvenile salmonids, *Turbine intake gatewells, Migration timing, Seaward migration.

Turbine intake gatewells at Ice Harbor Dam on the Snake River were evaluated for their utility as collection areas of juvenile salmonids. The investigation took place from 1964 through 1966; results indicated that gatewell collecting is economical and efficient. One 3-man crew, in 1964, did the sampling; depending on water flow, the collections represented 2 to 6% of the total population. The sampling rate in the gatewells will enable a high degree of confidence to be placed on measurements of timing, migration rates, survival, and relative mgnitude of the seaward migrations. (Katz)

THE RESPONSE OF FISH BLOOD CELLS, PARTICULARLY THROMBOCYTES, TO DECOMPRESSION,
Washington Univ., Seattle. Fisheries Research Inst.
E. Casillas, L. S. Smith, and B. G. D'Aoust.
Undersea Biomedical Research, Vol. 3(3), September 1976, p. 273-281, 5 tab., 18 ref.

Descriptors: *Chinook salmon, *Fish physiology, *Fish behavior, Laboratory tests, Laboratory animals, *Hydrostatic pressure, Bioassay, Mortality, *Pressure, Depth, Gases.
Identifiers: *Fish blood cells, *Thrombocytes, *Decompression, Hyperbaric chamber, *Lethal decompression, Non-lethal decompression, *Gas solubility, Blood coagulation, Erythrocytes, Leucocytes.

The effects of decompression on various blood-cell types in chinook salmon (Oncorhynchus tshawytscha) were investigated using a 4-liter hyperbaric chamber. Thrombocytes (platelets) were found to decrease significantly in numbers following lethal and nonlethal decompressions. The response was highly dependent on depth, gas solubility, and rate of decompression, whereby increasing depth or gas solubility caused greater and faster declines of thrombocyte levels. Return of thrombocyte numbers to normal values usually occurred within 48 hours, except after the more severe decompressions where recovery was never fully attained during the sampling period. Erythrocyte levels increased significantly 1 day after a severe decompression, suggesting hemoconcentration. Leucocytes appeared not to respond to decompression; they were not decreased compared to normal levels although they were significantly decreased compared to levels of the chamber controls in the nonpressurized chamber. (Katz)
W77-07420

THE EFFECTS OF HIGH VACUUM ON FISH,
Arkansas Game and Fish Commission, Lonoke.
J. Hogan.

Transactions of the American Fisheries Society, Vol. 70, 1941, p. 469-474.

Descriptors: *Freshwater fish, *Mortality, *Fishkill, Arkansas, Bass, Warm water fish, *Laboratory tests, *Floodways, *Siphons, Fish physiology, Methodology, Bioassays.
Identifiers: *St. Francis River(Ark), *Negative pressure, *High vacuum, *Bluegill sunfish.

A set of three large siphon tubes has been installed on the lower St. Francis River in Arkansas, which pass the normal flow of the river. They operate with a negative pressure equivalent to from 18 to 26 inches of mercury. Experiments with fish held under negative pressure in aquaria for the length of time required to pass through the tubes have been conducted and some species of fish show serious injury. Those that are physostomous are more able to make the sudden change or adjustment in the swim bladder necessary when passing through the tubes, while physoclistous fish are unable to make the sudden adjustment and suffer hemorrhage in the circulatory system and many die. There is need for close cooperation between engineers and fishery administrators in designing and constructing devices that are apt to affect fish life in public waters. (Katz)

DISSOLVED GAS SURVEY, PACIFIC NORTHWEST REGION.
Bureau of Reclamation, Boise, Idaho. Regional Soil and Water Lab.
December, 1973. 26 p, 36 tab. 3 fig.

Descriptors: *Dissolved oxygen, Nitrogen, *Supersaturation, *Columbia River, *Pacific Northwest, U.S., Oregon, Washington, Idaho, On-site investigations, On-site data collection, Methodology, Dams, Dam sites, Water quality, *Water quality standards, Monitoring.
Identifiers: *Nitrogen supersaturation.

The Bureau of Reclamation conducted nitrogen gas surveys of all the Bureau dams in the Pacific Northwest. A mobile laboratory was used. Only four locations were found where the dissolved nitrogen content was above the usual state standards of 110%. Mason dam waters in Eastern Oregon were 120% saturation near the dam. Most of the excess was dissipated within two miles below the dam. Dissolved oxygen varied between 89 and 112 percent saturation. (Katz)

EFFECTS OF PRESSURE ON SURVIVAL OF SIX SPECIES OF FISH,
Maine Dept. of Inland Fisheries and Game, Augusta.
R. E. Foye, and M. Scott.
Transactions of the American Fisheries Society, Vol. 94 (1965), p. 88-91.

Descriptors: *Hydroelectric power, *Perch, *Lake trout, *Atlantic salmon, Laboratory tests, Bioassay, Mortality, *Hydrostatic pressure, *Maine, *Fish physiology, *Fish behavior, Pumping plants.
Identifiers: Kennebec River(Maine), Wyman River(Maine).

A study was made to determine the effects of pressures likely to be encountered in a pumping station in Maine. Experiments were conducted with chain pickerel, yellow perch, fall fish, common shiner, lake trout and Atlantic salmon. Test fish exhibited extreme and erratic violent swimming activity for the first few seconds after exposure to a pressure of 300 psi. Salmon, lake trout and fall fish experienced no mortality during the 7-day period after exposure. Sixty percent of yellow perch died after 7 days. (Katz)

Descriptors: *Columbia River, *Chinook salmon, *Fish migration, *Fish passage, Fish behavior, Rainbow trout, Fish diseases, *Supersaturation, *Spillways, Water temperature, Research and development, Laboratory tests, On-site investigations, Juvenile fish.
Identifiers: *Snake River, *Gas bubble disease, *Columbia River Basin, *Steelhead trout, *Fishway, *Fish ladders, Fish tracking, Traveling screen, Fish transport, Pacific salmon.

The problems to salmon and steelhead trout utilizing the Columbia and Snake Rivers are described. Methods to solve these problems are suggested. Problems include the upstream passage of adult fish at dams; the downstream passage of juvenile fish; the changing environment caused by dams, gas bubble diseases due to supersaturated atmospheric gases. Engineering structures and fish transport facilities that move the juvenile salmon past the dam hazards are described. Research programs and facilities are discussed. (Katz)

SECOND STATUS REPORT ON ANADROMOUS FISH RUNS OF THE COLUMBIA RIVER,
Oregon Fish Commission, Portland.
C. O. Junge, and J. B. Haas.
Pacific Northwest River Basins Commission, Vancouver, Washington, May 1974, 24 p., 2 fig., 3 tab.

Descriptors: *Columbia River, *Chinook salmon, *Salmon, Rainbow trout, *Dams, *Fish migration, *Fish passage, *Shad, Sport fishing, *Hydroelectric power, Water quality, *Supersaturation, Fish diseases, Mortality, Sockeye salmon.
Identifiers: Spring chinook salmon, Fall chinook salmon, Summer steelhead coho salmon.

The status of the various runs of salmon and shad in the Columbia River is reported. The problems affecting the sports and commercial species on the river include fish passage problems, and the impact of power peaking. Progress is being made to compensate for fish and habitat loss. Supersaturation of atmospheric gases (nitrogen) is responsible for significant mortalities. The removal of water for irrigation and industrial use and the determination of water quality affects the fishery. Recommendations are presented. (Katz)

EFFECT OF SILT AND SALINITY ON THE MORTALITY OF MERETRIX LUSORIA (ROEDING), (IN KOREAN),
Pusan National Univ. (Republic of Korea).
S. D. Chang, P. Chin, and B. O. Sung.
Bull Korean Fish Soc 9(1), p 69-73, 1976.

Descriptors: *Silts, *Salinity, *Mortality, Sands, Oxygen, *Clams, Sediments, Clays, Soils, Water pollution.
Identifiers: Meretrix-lusoria.

Mortality of the clam M. lusoria was measured in experimental cultures under different sediment compositions and different salinities. Mortality was significant in silt and clay and low in sand and sand-silt. In groups cultured in silt and clay, young of 2.5 cm shell length were subject to early and high mortality (85% in 41 days). The larger the shell size the later and lower the mortality. Mortalities of groups maintained in silt and clay differed under different salinities. Survival rate in sea water of low salinity was higher than that in the high salinity water. O2 consumption of isolated gill tissue was little different in groups maintained in silt and clay and those in sand (the control-group). Mortality resulted mainly from the deposition of silt and clay, although the survival rate of M. lusoria depended on water temperature, salinity, dissolved O2, body size and other factors.--Copyright 1977, Biological Abstracts, Inc.

GAS BUBBLE DISEASE MORTALITY OF ATLANTIC MENHADEN AT PILGRIM NUCLEAR POWER STATION, APRIL, 1975,
Yankee Atomic Electric Co., Westborough, Mass. Environmental Engineering Dept.
R. A. Marcello, Jr.
Report prepared for Boston Edison Co., Boston, Massachusetts. Publish in: Marine Ecology Studies Related to Operation of Pilgrim Station, Semi-Annual Report 6, Vol. 2(6), 1975, 18 p., 3 fig, 1 tab., 11 ref.

Descriptors: Fishkill, *Mortality, *Thermal power, *Nuclear powerplants, Nuclear energy, Industrial wastes, Water temperature, *Thermal pollution, Fish disease, Supersaturation, Fish behavior, Marine fish, *Atlantic menhaden, On-site investigations.
Identifiers: *Gas bubble disease, Discharge channel, Thermal plume, Pilgrim Nuclear Power Station, Dissolved gases, *Discharge barrier net, Acoustic dispersion.

A mortality of Atlantic menhaden occurred in the discharge channel and thermal plume of the Pilgrim Nuclear Power Station Unit 1. Gas bubble disease was identified as the cause of this mortality. In April 1975, an additional mortality was observed in the discharge channel at Pilgrim Station. The events that transpired during the April 1975 episode are given. Data on dissolved oxygen saturation levels, fish behavior, mortality estimates, fish diversion attempts, were presented. (Katz)

EFFECT OF METHOD OF INTRODUCING WELL WATER ON THE GROWTH, BODY CHEMISTRY AND INCIDENCE OF EYE ABNORMALITIES OF JUVENILE BROWN AND RAINBOW TROUT,
Bureau of Sport Fisheries and Wildlife, Cortland, N. Y.
H. A. Poston, D. L. Livingston, and D. G. Hedrick.
The Progressive Fish Culturist, Vol. 35(4), October 1973, p. 187-190, 7 fig, 2 tab.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Rainbow trout, *Fish diseases, *Fish hatcheries, *Brown trout, Growth rates, Water supply, Wells, Laboratory, *Supersaturation, *Flow rate, *Nitrogen, Mortality, Juvenile fish, Water.
Identifiers: *Eye abnormalities, Popeye, Tissue fat, *Nitrogen supersaturation, *Gas bubble disease.

Rainbow and brown trout fingerlings held in water dispensed through metal, single-aperture flow regulators were larger, showed better food conversion, and had fewer eye abnormalities than those held in water from multiperforated PVC pipe. The brown trout, although larger at the start, grew less, showed more popeye, and contained less tissue fat and more water at the end than rainbow trout. Chronic exposure of fish to nitrogen supersaturation is probably the cause of increased eye abnormalities. When nitrogen supersaturation exists, a system for reducing the level to near saturation is necessary to help minimize development of fish eye abnormalities. (Katz)

TOLERANCE OF SELECTED FISH SPECIES TO ATMOSPHERIC GAS SUPERSATURATION,
Battelle Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.
D. H. Fickeisen, J. C. Montgomery, and M. J. Schneider.
Presented at American Fisheries Society, 103rd Annual Meeting, Orlando, Florida, September 6-12, 1973, BNWL-SA-4794, 13 p., 21 fig., 1 ref.

Descriptors: *Bioassay, Mortality, Laboratory tests, *Atmospheric gas, Supersaturation, *Fish disease, Salmonids, Gas chromatography, Bass, Bullheads, Catfishes, *Rainbow trout, Carp, Suckers, Animal pathology.
Identifiers: *Nitrogen supersaturation, *Gas bubble disease, *Tolerance, *Relative tolerance, Heart embolism, Subepidermal emphysema, Molecular sieve, Gas chromatography, Mountain whitefish, Smallmouth bass, Channel catfish, Black bullhead, Pumpkinseed, Bluegill, Largescale sucker, Northern squawfish.

Several fish species were collected in SE Washington, acclimated to 20C and 100-150% gas supersaturation, and exposed to high gas content waters (100-140% supersaturation) at 20C under standard acute bioassay conditions. The fish were monitored to determine death time and necropsyed to determine the cause of death. The species exhibited a differential tolerance to high gas levels with smallmouth bass more tolerant and salmonids less tolerant. Nearly all fish which died during the test exhibited signs of gas bubble disease, ranging from massive heart embolism to mild subepidermal emphysema. These signs were related to exposure time and to gas supersaturation levels. Gas concentrations were monitored by molecular sieve gas chromatography. (Katz)

THE EFFECT OF TEMPERATURE ON SIZE AND STRUCTURE-II. THE BODY MUSCULATURE OF CYCLOPS AGILIS (KOCH, SARS),
Trinity Coll., Dublin (Ireland). Dept. of Zoology.
E. Campbell, and J. N. R. Grainger.
Proceedings of the Royal Irish Academy, Vol. 75, Sec. B, No. 20, 1975, p 391-399, 4 tab, 23 ref.

Descriptors: Environmental effects, *Temperature, *Crustaceans, Size, Growth rates.
Identifiers: Musculature, Body size, *Cyclops agilis.

Body muscle fibres of adult Cyclops agilis were measured in animals reared at 10, 15, and 25 C. It was concluded that differences existing between muscles of animals reared at different temperatures lie in the differences in fibre diameter. This was greatest at 15C and the average 15C fibre contained more myofibrils than the 25 C muscle. Filament spacing measurements showed that there was markedly more contractile material in the 15 C as compared with the 25 C muscle. The 15 and 25 C results followed the general pattern of decreasing size with increasing rearing temperature but the 10 C did not. This anomaly was not explained. Sarcomere length and A-band length were constant. (Chilton-ORNL)

PRELIMINARY INVESTIGATIONS ON BIVALVES BIVALVIA OF THE DAM RESERVOIR AT GOCZALKOWICE,
Polish Academy of Science, Pszcyna. Lab. of Water Biology.
E. Krzyzanek.
Acta Hydrobiologica, Vol. 18, No. 1, p. 61-73, 1976. 7 fig., 4 tab., 15 ref.

Descriptors: *Mollusks, *Reservoirs, *Biomass, *Spatial distribution, Dominant organisms, Reservoir stages, Succession.
Identifiers: *Bivalves, *Goczalkowice Reservoir(Poland), Unio pictorum, Anodonta cygnea.

The role of bivalves in the Goczalkowice dam reservoir is investigated, focusing on their qualitative and quantitative composition, their biomass including shells and their age structure. A succession of occurence of macrofauna between 1956 and 1973 was shown, from small species of the genus Pisidium, through the genus Anodonta, to the genus Unio pictorum. Results indicate that the current dominating species is Unio pictorum, found mainly in the sandy bottom of the northern part of the reservoir. The second most numerous species, Anodonta cygnea, was found in the muddier bottom of the southern part of the reservoir. The second most numerous species, Anodonta cygnea, was found in the muddier bottom of the southern part of the southern part of the reservoir. Spatial distribution analysis showed that Unio pictorum occurred most numerously at a depth of 2 m while Anodonta cygnea distribution was heaviest at 6 m. It is estimated that there were 106 million bivalves with a biomass of 5038 tons, or 4 specimens of 20 dag biomass per sq m. Biometric measurements to determine age structure indicated that Anodonta cygnea had the largest number of specimens in the 8 to 10 year age class, while Unio pictorum and Unio tumidus were predominant in the 6 to 8 and 4 to 6 year age classes, respectively. The number of younger specimens increased at greater depths for both Anodonta cygnea and Unio pictorum. (Luedtke-Wisconsin)

NITROGEN, PHOSPHORUS, PARTICULATE AND COLLOIDAL CARBON CONTENT OF SEDIMENTING SESTON OF A HARD-WATER LAKE,
W. S. White, and R. G. Wetzel.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 330-339, 1975. 8 fig., 20 ref.

Descriptors: *Seston, *Sediments, *Nitrogen, *Phosphorus, *Calcium carbonate, Colloids, Suspension, Translocation, Primary productivity, *Michigan, *Lake sediments.
Identifiers: *Lawrence Lake(Mich), Sedimentation traps.

Seston, the living and non-living particularate material suspended in the pelagic region of a lake, was collected biweekly at 4-meter intervals for two years by means of an improved sedimentation trap in Lawrence Lake (southwestern Michigan). Lawrence is a 4.96 ha 12.6 m-deep hard-water lake located in a drainage basin of predominantly limestone deposits. Chemical analyses of the sedimenting seston indicated significant spatial and temporal changes. A marked displacement of phosphorus from the epilimnion into the metalimnion was found in mid-summer. High rates of calcium carbonate precipitation, induced by photosynthesis, facilitated nutrient removal to the hypolimnion. During fall overturn an average of .17 micrograms per square meter per day was resuspended. Total nitrogen content of the sedimenting seston changed throughout the year; a marked displacement to the hypolimnion occurred in late summer. Pronounced changes in the particularate organic carbon fraction, strongly related to primary productivity, were not as apparent as other seston parameters. More than a third of the calcium content is in the form of colloidal calcium carbonate that forms a major sink for inorganic and organic nutrients. (Harris-Wisconsin)

SUCCESSION RATES IN LAKE PHYTOPLANKTON COMMUNITIES,
N. J. Williams, and C. R. Goldman.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 808-811, 1975. 1 fig., 7 ref.

Descriptors: *Rates, *Lakes, *Phytoplankton, *Succession, Limnology, Biological communities, Persistence, Speciation, Biomass, Trophic level, Climatic zones, Primary productivity.
Identifiers: Lake Tahoe(Cal-Nev), Castle Lake(Cal), Clear Lake(Cal), Lake Victoria(Africa).

Discussion is centered on progressive changes in relative species composition of phytoplankton in five lakes which represent extremes and medians of production. Included were: (1) Lake Tahoe, an ultra-oligotrophic, subalpine warm monomictic lake; (2) Castle Lake, California, a dimictic, mesotrophic subalpine lake; (3) Clear Lake, California, a polymictic, lower-altitude productive aquatic environment; (4) Lake Victoria, Africa, representing equatorial regions; and (5) an arctic pond to represent conditions typical of polar latitudes. Comparison of succession rates for the five lakes demonstrated that the non-tropical lakes show significant seasonal variation in succession. Additionally, maximum succession rates occur after community independent environmental perturbations which are usually but not necessarily correlated with periods of high primary productivity. Finally, it was found that in the absence of disturbance succession rates decline and remain low, partly because of community dependent processes. Equations are given in the text for measuring rate of succession by calculating the change in the relative contribution of individual species to total biomass diversity. Notation is given for the fraction of total diversity attributable to a single species, and a succession rate index that measures the speed at which the community moves through diversity space where the dimensions are the proportion of total diversity contributed by a particular species. (Harris-Wisconsin)

SPATIAL AND TEMPORAL CHANGES IN THE PRIMARY PRODUCTIVITY OF LAKE TAHOE, CALIFORNIA-NEVADA BETWEEN 1959 AND 1971,
California Univ., Davis. Inst. of Ecology.
C. R. Goldman, and E. de Amezaga.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 812-825, 1975. 7 fig., 2 tab., 24 ref.

Descriptors: *Primary productivity, *Trophic level, *Urbanization, Lakes, Phytoplankton, Social impact, Human population, Sewage disposal, Nutrients, Euphotic zone, Littoral, California, Nevada, Eutrophication.
Identifiers: *Lake Tahoe(Cal-Nev).

Intensive study of Lake Tahoe during 1967-71 and comparisons made with 1959-60 data show a dramatic increase in primary productivity for this remarkably blue and transparent alpine lake, a measure of increased cultural eutrophication that continues despite steps taken to export sewage from the lake's basin. During the latter period primary productivity increased 25.6% and this increase rises to 51% if compared with the 1959-60 data. It is assumed that the rapid build-up population around the lake in recent years have caused soil and vegetation disturbances which have replaced the nutrients that formerly were derived from treated sewage. The euphotic zone in Lake Tahoe often exceeds 100 m depth, and maximum phytoplankton may occur as deep as 50-75 m. The vertical profile is established in early December with a single production peak in the vicinity of 50 m. As stratification develops the unimodal productivity curve is transformed into a bimodal one which persists through the rest of the season. A trend is seen in which the seasonal maximum in productivity is retarded. Synoptic studies show that pelagic phytoplankton productivity has steadily increased relative to productivity in the littoral zone. Although the latter zone contributes only 10% of the lake primary productivity, it is visibly the greatest evidence of eutrophication in Lake Tahoe. (Harris-Wisconsin)

EFFECT OF DDT ON PHOTOSYNTHESIS OF SELENSTRUM CAPRICORNUTUM,
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
S. S. Lee, S. C. Fang, and V. H. Freed.
Pesticide Biochemistry and Physiology, Vol. 6, No. 1, p. 46-51, 1976. 2 fig., 1 tab., 29 ref. PHS ES-00210, R01 ES00654-01.

Descriptors: *DDT, *Chlorophyta, *Photosynthesis, Algae, Chlorinated hydrocarbon pesticides, Path of pollutants, Carbon cycle, *Eutrophication, Water pollution effects.
Identifiers: Selenastrum capricornutum.

The effect of the chlorinated hydrocarbon DDT on carbon assimilation of a green alga, Selenastrum capricornutum, found in eutrophic freshwaters, was studied. Results indicated that DDT concentrations between 3.6 and 36 ppb (the latter approaching DDT concentration in polluted water) inhibited the incorporation of carbon-14 into both ethanol-soluble fractions and ethanol-insoluble fractions. Inhibition of carbon dioxide fixation was greater as the exposure of algae to DDT increased. Kinetic studies of photosynthetic carbon dioxide fixation indicated that DDT stimulated the incorporation of carbon-14 into glycolic acid, a major compound of photorespiration, and caused the concomitant suppression of flow of carbon-14 into aspartic acid, a major component of the C4-dicarboxylic acid pathway. The DDT shift from an efficient pathway into an inefficient pathway was interpreted to be through interruption of cyclic photophosphorylation. (Luedtke-Wisconsin)

A MODEL OF THE PHOSPHORUS CYCLE AND PHYTOPLANKTON GROWTH IN SKAHA LAKE, BRITISH COLUMBIA, CANADA,
W. M. Fleming.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 229-240, 1975. 5 fig., 2 tab., 22 ref.

Descriptors: *Trophic level, *Phosphorus, *Model studies, Eutrophication, Phytoplankton, Simulation analysis, Lakes, Dissolved oxygen, Water quality, Primary productivity, Diffusion, Sedimentation, *Canada, Cycling nutrients.
Identifiers: *Skaha Lake(British Columbia), *Phosphorus cycle.

A simulation model is described which shows that in measuring the phosphorus cycle in Skaha Lake (British Columbia), total phosphorus is a useful indicator for the prediction of trophic states. Difference equations and a daily time scale are used in a mass balance model which accounts for the dynamic stratification regime of the lake. A series of submodels detail total phosphorus movement between the epilimnion, hypolimnion and sediments. An eddy diffusion submodel predicts loading from the hypolimnion to the epilimnion which can equal external loading for short periods in the summer. A phosphorus regeneration submodel predicts organic sedimentation on the basis of primary production and inorganic sedimentation from adsorption considerations. A regeneration submodel considers temperature-related decomposition rates of sedimented phosphorus. A primary production submodel accounts for temperature, light and phosphorus dependency, as well as respiration, grazing, sinking and advection losses. Based on known phosphorus loading and limnological data from three years of study, reasonable agreement was found between real and simulated total phosphorus concentration, phytoplankton biomass and hypolimnetic dissolved oxygen. (Harris-Wisconsin)

PREDICTING THE IMPACTS OF PHOSPHORUS MANAGEMENT POLICIES ON THE EUTROPHICATION OF SKAHA LAKE, BRITISH COLUMBIA, CANADA,
W. M. Fleming, and J. G. Stockner.
Verhandlungen Internationale Vereiningung Limnologie, Vol. 19, Part I, p. 241-248, 1975. 4 fig., 1 tab., 8 ref.

Descriptors: *Eutrophication, *Trophic level, *Phosphorus, *Simulation analysis, *Phytoplankton, *Projections, Model studies, Water quality control, Tertiary treatment, Dissolved oxygen, Lakes, *Canada, Management.
Identifiers: *Skaha Lake(British Columbia).

Probable effects of four alternative phosphorus management policies on Skaha Lake (British Columbia) are assessed, using 20 years of hydrologic data and the eutrophic conditions of 1970 as a starting point. Using the first simulation, with no phosphorus removal and no increase in loading over the 20-year period, phytoplankton blooms will increase in intensity and hypolimnetic dissolved oxygen will approach zero while phosphorus concentrations will exceed 60 microgram/l. With 60% removal of municipal phosphorus and conditions of either high or low economic growth, the eutrophic conditions of 1970 are reached within 12-14 years. Algal blooms and hypolimnetic dissolved oxygen deficits are particularly serious during dry years. With 100% municipal phosphorus removal, trophic conditions appear to improve significantly, with the possibility of minor algal blooms during only dry years. The simulation uses a model previously made of the phosphorus-phytoplankton system in a British Columbia lake, which showed that total phosphorus can be a useful indicator for the prediction of trophic states. Skaha Lake is dimictic and has an average water residence time of 1.2 years. Maximum depth is 57 m, mean depth is 28 m, length is 11.9 km and width is 2.4 km. Total phosphorus at spring mixing is usually greater than 30 micrograms. Loading generally exceeds 1 gram per square meter per year and the hypolimnetic oxygen depletion rate is greater than .05 mg per square centimeter per day. (Harris-Wisconsin)

SUB-THERMOCLINE BIOMASS CONCENTRATION DETECTED BY TRANSMISSOMETER IN LAKE SUPERIOR,
N. H. F. Watson, K. P. B. Thomson, and F. C. Elder.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 682-688, 1975. 2 fig., 2 tab., 10 ref.

Descriptors: Instrumentation, *Lake Superior, *Thermocline, *Light penetration, *Telemetry, *Biomass, Transmissivity, Zooplankton, Phytoplankton, Euphotic zone, Limnology, On-site data collections, Suspension, Sampling, Eutrophication, Bioassay, Pollutant identification.
Identifiers: *Transmissometers, *Sub-thermocline.

A Martek Transmissometer (Model XMS) was used on Lake Superior study cruises in 1973 to measure the optical beam attenuance or transmittance, referenced to a clear air path, as a function of depth. The measured transmittance is dependant on the scattering due to particles in suspension as well as the absorption from dissolved substances and any absorption due to the particles themselves. During September, transmittance profiles showed a marked minima at about 20-25 m depth over very large areas of Lake Superior. Vertical zooplankton hauls with nets were frequently clogged with fine yellowish-brown material at stations where this layer of low transmission was extensive. Analyses which followed subsequent sampling indicated considerably more chlorophyll a in the layer of minimum transparency than in the upper 20 m. At some stations concentrations were up to four times as high at 25-30 m as in the 0-20 m stratum. This indicated that the bulk of the material causing the transmission minimum was of algal origin. A conclusion is postulated that considerable quantities of phytoplankton algae may accumulate at depths just below the thermocline and the bottom of the photic zone in deep, large lakes. Estimates of production of such bodies of water based on synoptic surveys of surface or mean epilimnion concentrations of phytoplankton biomass as suggested by other research may underestimate the production considerably. (Harris-Wisconsin)
W77-07447

SYNERGISTIC EFFECTS OF PHOSPHATE AND MANGANESE ON GROWTH OF LAKE SUPERIOR ALGAE,
J. Shapiro, and G. E. Glass.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 395-404, 1975. 6 fig., 2 tab., 7 ref.

Descriptors: *Lake Superior, *Manganese, *Phosphates, *Algae, Iron compounds, Lakes, *Growth rates, Mine wastes.
Identifiers: *Taconite tailings, *Synergistic effects, Biostimulants.

Continuing earlier research aimed at assessing effects of the wastes from an iron ore (taconite) processing plant on Lake Superior, further evidence is presented that taconite tailings do stimulate growth of the lake's native algae. Evidence is also shown that both manganese and phosphate are limiting elements in the lake; that phosphate and manganese are synergistic in their effects as are phosphate and taconite; and that the stimulatory agent in taconite is in fact manganese, addition of which to the lake probably makes Superior mush more responsive to phosphate that may enter it from other sources. Approximately 60,000 metric tons of taconite waste enter Superior every day near its western end. About 40% of the wastes are less than 44 microns in size, considerable quantities find their way throughout the western arm of the lake. The combined findings are also important because they demonstrate the combined effect of manganese and phosphate or taconite and phosphate in combination is very much greater than their individual effects. The significance of the findings is that, while the Lake Superior watershed is relatively uninhabited today, with consequently only a relatively small inflow of phosphate into the lake, increases in population and development in the future would increase the degree of synergism between the taconite wastes and newly-added phosphate. Dramatic increases in nuisance algal growth could well result. (Harris-Wisconsin)

LIBRARY U. OF I. URBANA-CHAMPAIGN

PLUTONIUM IN THE LAURENTIAN GREAT LAKES: COMPARISON OF SURFACE WATERS,
M. A. Wahlgren, and D. M. Nelson.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 317-322, 1975. 1 fig., 4 tab., 12 ref.

Descriptors: *Great Lakes, *Radioisotopes, *Lake Michigan, *Lake Erie, *Lake Huron, *Lake Ontario, *Lake Superior, *Fallout, *Radioactive wastes, Cesium, Water pollution sources, Trace elements, Turnovers, Distribution patterns, Plankton, Strontium radioisotopes, Pollutant identification.
Identifiers: *Plutonium.

Results of studies of plutonium in Lake Michigan suggest that biological processes are significant factors in determining the turnover time for this element in Great Lakes waters. Studies of plutonium fallout in the lake, which is essentially a closed system, have demonstrated that only about 3% of the estimated cumulative deposition is retained in the water column, and that winter mixing results in a homogeneous distribution of radionuclides in the water column by spring. In an experiment that assumed similar mixing behavior in the other Great Lakes, surface water and plankton samples were measured from all five lakes in 1973. The range in plutonium concentrations over the five lakes was remarkably narrow in view of the diverse area-to-volume ratios and outflow characteristics of the lakes. Average concentrations were about .6 fCi/l in Superior, Michigan and Huron and .2 fCi/l in Erie and Ontario. Most-rapid removal of plutonium and cesium was in the shallow and eutrophic Lake Erie western basin. A consistent relationship between plutonium concentrations in water and in plankton has been observed in all five lakes, suggesting equilibrium between aqueous and sorbed plutonium. The concentration of plutonium in the Lake Michigan epilimnion is depleted rapidly during early summer but returns to nearly its previous level by the following spring. (Harris-Wisconsin)
W77-07449

PHOTOSYNTHETIC RATES IN LAKE SUPERIOR,
J. Verduin.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 689-693, 1975. 1 fig., 1 tab., 3 ref.

Descriptors: *Lake Superior, *Photosynthesis, *Water sampling, *Estimating, Acidity, Alkalinity, Acid-base equilibrium, Euphotic zone, Primary productivity, Pollutant identification, Bioassay.
Identifiers: *Photosynthetic rates.

Determination was made of photosynthetic rates by three separate techniques on Lake Superior during a cruise in the summer of 1973: (1) carbon-14 uptake rates in clear and dark bottles; (2) change in acidity-alkalinity in clear and dark bottles; and (3) change in acidity-alkalinity between early morning and late afternoon as derived from acid-alkaline balance as compared with depth profiles in the open lake. Photosynthetic yields revealed large discrepancies among these three methods. Assuming that clear vs. dark bottle data represents the average yield in the euphotic zone (36 meters) and that the photoperiod is 14 hours, then the first method yields 14 millimoles per square meter per day, the second method yields 111 and the third method yields 200. Because practically all Lake Superior productivity data in the literature are based on carbon-14 data, it seems likely that the estimates of the degree of oligotrophy of the lake have been biased by the low photosynthetic yields obtained by this method. (Harris-Wisconsin)

INFLUENCE OF THE DRAINAGE BASIN ON THE EUTROPHICATION OF THE A-MESOTROPHIC LAKE PIASECZNO AND DISEUTROPHICATION OF THE POND LAKE BIKCZE,
Instytut Przyrodniczych Podstaw, Lublin (Poland). Produkeji Roslinnej AR.
I. Wojciechowski.
Acta Hydrobiologica, Vol. 18, No. 1, p. 23-52, 1976. 10 fig., 3 tab., 20 ref.

Descriptors: *Eutrophication, *Watersheds(Basins), Nutrient removal, Mesotrophy, Surface runoff, Subsurface runoff, Runoff, Lakes, Ditches, Embankments, Drainage engineering, Nutrients, Bogs, Humic acids, Drainage basins.
Identifiers: Lake Piaseczno(Poland), Lake Bikcze(Poland), *Lake renewal.

The eutrophic influence of the drainage basin on lakes in the Leczynsko-Wolodawskie Lake District was studiied and a method and the effect of isolating one of them from its drainage basin was ivestigated. It was found that fertilization of Lake Piaseczno and Lake Bikcze occurred only through surface and groundwater runoff from the drainage basin, depending on the balance of precipitation and water evaporation. During recent years, Lake Piaseczno has been marked by eutrophication, while a rapidly proceeding reverse tendency has been observed in nearby Lake Bikcze. Eutrophication inhibition in the latter resulted from its being isolated from its drainage basin by surrounding the lake with earth embankments and a ditch deeper than the groundwater level. Dissolved nutrients running off toward the lake from the drainage basin were carried beyond the lake. Blanket peat bogs left within the circumference of ditches were gradually transformed into raised peat bogs as the fertilizing waters were cut off. This supplied the lake with increased amounts of humic acids whose particles absorbed mineral salt cations dissolved in the water, causing diseutrophication of the lake. These mechanisms of inhibiting eutrophication and inducing diseutrophication may be applicable to other closed lakes in a similar climate, provided no discharge of sewage takes place. (Luedtke-Wisconsin)

EFFECT OF ZOOPLANKTON GRAZING ON PHOTOSYNTHETIC ACTIVITY AND COMPOSITION OF PHYTOPLANKTON,
Z. M. Gliwicz.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1490-1497, 1975. 4 fig., 1 tab., 13 ref.

Descriptors: *Photosynthesis, *Phytoplankton, Grazing, *Zooplankton, Tropical regions, Regression analysis, Biomass, Lakes.
Identifiers: Gatun Lake(Panama Canal Zone), Madden Lake(Panama Canal Zone).

Whether zooplankton grazing can be a stimulus for plankton primary production was investigated in two tropical reservoirs in the Panama Canal Zone (Gatun Lake and Madden Lake) and in a Polish temperate pond heated by power plant effluents. Multiple regression analysis based on light, temperature, nutrient income from the drainage basin and from deeper lake layers, light utilization efficiency, intensity of nutrient recycling, zooplankton grazing, the share of nannoplankton in the phytoplankton standing crop, efficiency of nutrient utilization by algae, and species diversity was utilized to determine which parameters most affect plankton photosynthetic activity. Only two factors--the quantity of phytoplankton biomass and the grazing intensity by filter feeding zooplankton--were significant. It was evident that phytoplankton photosynthesize more actively when their biomass is lower not only because of a weaker self-shading effect, but also because a smaller amount of nutrients is internally retained, thus enhancing the amount of nutrients available for algal growth. Consequently, more intensive grazing reduces the algal standing crop and the amount of nutrients retained, with resultant faster algal decomposition, and acceleration of nutrient regeneration, which, in turn, produces more efficient photosynthetic production. (Auen-Wisconsin)

Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1584-1592, 1975. 4 fig., 2 tab., 28 ref.

Descriptors: *Primary productivity, *Phytoplankton, *Periphyton, Biomass, Standing crops, *Canada, Carbon cycle.
Identifiers: *Ottawa River(Ontario).

The relative contribution of periphyton and phytoplankton to primary productivity in the Ottawa River was investigated near Ottawa, Canada by comparing biomass and the P/B ratio. The range between the seasonal minimum and maximum for phytoplankton was approximately 100-fold and that for periphyton 10,000-fold. The annual mean for phytoplankton biomass was 2.6 mg sq m while that for periphyton at 0.1 m depth was 14,000 mg/sq m and at 0.5 m depth, 2600 mg sq m. The P/B ratio for phytoplankton consistently exceeded that for periphyton; over the sampling year, that for phytoplankton was 27 and for periphyton 0.07. The data showed that the relatively-low periphyton P/B value is caused by high periphyton biomass, which was three orders of magnitude greater than that for phytoplankton. However, the periphyton and phytoplankton productivity values were of the same order of magnitude. It was evident that phytoplankton are the major primary producers. In the littoral zone periphyton are the dominant primary producers in terms of productivity and biomass even though the periphyton P/B is two orders of magnitude lower than that for the phytoplankton. The major conclusion is that the phytoplankton have much higher carbon turnover rates than the periphyton. (Auen-Wisconsin)

EXPERIMENTAL SEDIMENT ADDITION STUDIES ON THE HARRIS RIVER, N.W.T., CANADA: THE EFFECT ON MACROINVERTEBRATE DRIFT,
D. M. Rosenberg, and A. P. Wiens.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1568-1574, 1975. 1 fig., 3 tab., 8 ref.

Descriptors: *Spatial distribution, *Sedimentation, *Benthic fauna, *Suspended load, *Canada, On-site investigations, Analytical techniques, Model studies, Invertebrates.
Identifiers: *Harris River(NWT), Macroinvertebrate drift.

In this first of a series of studies on the effects of increased suspended sediment concentrations on various aspects of benthic macroinvertebrtes, the extent of macroinvertebrate drift due to various sediment loadings was investigated. The experiments were conducted in a segment of the Harris River, Northwest Territories (Canada), with sediment additions in concentrations ranging from 10 to 500 mg/1. Sand-sized particles (2 to .05 mm) composed approximately 25% of bankside sediment was used; the remainder was composed of approximately 50% silt (.05 to .002 mm) and 25% clay (<.002 mm). The total weight of sediment added during each experiment ranged from 2.4 to 26.3 kg or .05 to 2.9 kg sq m of stream bottom. Preliminary results of the investigation of the responses of individual macrobenthic taxa to various weights of sediment used showed that the

number of Chironomidae in the drift always increased with sediment addition. However, Ephemeroptera, Simuliidae, and Hydracarin were inconsistent in their responses to sediment additions. The least difference in mean numbers of macrobenthos drifting during control and sediment addition periods was at an intended suspended sediment concentration of 250 mg/1; the greatest was at 100 mg/1. The drift is not quantified in this research due to insufficient data on symbiotic interactions. (Auen-Wisconsin)

THE VERTICAL DISTRIBUTION OF PLANKTON ROTIFERS IN A SMALL ALPINE LAKE WITH A SHARP OXYGEN DEPLETION (LUNZER OBERSEE),
A. Ruttner-Kolisko.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1286-1294, 1975. 7 fig., 8 ref.

Descriptors: *Rotifers, *Oxygen sag, *Spatial distribution, Vertical migration, Ecological distribution, Behavior, Europe, Diel migration, Alpine, Lakes.
Identifiers: *Lunzer Obersee(Austria), *Alpine lakes.

The vertical distribution of planktonic rotifers was studied in relation to oxygen depletion in a small Austrian alpine lake, the Lunzer Obersee. Although unaffected by humans, the lakes's oxygen regime has changed in the last 30 years when the whole water column was oxygenated during the autumn turnover, while in recent years the bottom 3-4 meters remained practically oxygen-free. Among the seven plankton species which presently occur, Keratella cochlearis dominates the winter plankton completely, forming two maxima-- a large one in the upper layer and a smaller but very distinct maxima in the deeper deoxygenated zone. The two major constituents of winter plankton, observed in 1943, Filinia terminalis and Keratella testudo, both with a maximum at a very low oxygen content, are now reduced to a few individuals per liter. During summer stratification the rotifer diversity has changed to a nearly uniform population of Polyarthra dolichoptera, which shows a similar vertical distribution and about an equal density as K. cochlearis in winter. At turnover time, K. cochlearis dominates, but a variety of other species, even greater than in 1943, coexist. The vertical distribution pattern is a characteristic ecological feature which is maintained throughout the whole seasonal appearance of a particular species. The rotifers appear to respond to oxygen depletion by use of oxygen diffusion, vertical migration, and reduced metabolism. (Auen-Wisconsin)

COMPOSITION AND DYNAMICS OF THE BOTTOM ANIMALS IN THE LITTORAL ZONE OF DOJRAN LAKE, MACEDONIA,
J. A. Sapkarev.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1339-1350, 1975. 11 fig., 4 tab., 24 ref.

Descriptors: *Benthos, *Littoral, Varieties, Eutrophication, Aquatic animals, Animal populations, Dominant organisms, Europe, *Bottom sediments, *Lakes.
Identifiers: *Lake Dojran(Yugoslavia).

The density, species, seasonal dynamics and ecological distribution of the benthic animals in the littoral zone of eutrophic Lake Dojran, Macedonia (Yugoslvia), are described. The substrate of the littoral zone is composed mainly of fine sands, mud mixed with sand, and mud with detritus, but the greater portion is covered with dense macrophytic vegetation. The stony habitat contains the greatest variation, dominated by chironomids and leeches, which together with gastropods, oligochaetes and crustaceans, form the major community structure. The fine sand habitat (0-1 m depth) includes only six animal groups, dominated by oligochaetes and chironomids, followed by crustaceans and leeches; mayflies and caddisflies are represented by only one species each. The mud and sand habitat covered by macrophytes, located mainly between 1 and 3 m depth, contains the richest bottom fauna. At least 16 animal groups inhabited this community, but 13 oligochaete species and 8 crustacean species predominate, some reaching very high densities. The mud-detritus habitat, at 3-4.5 m depths, is relatively rich in bottom fauna; it contains at least 14 groups with the greatest number of species (9 oligochaetes and 7 chironomids). Seasonal variations in population densities and the species occupying each habitat are detailed. (Auen-Wisconsin)

THE LARVAL SPIRURID NEMATODES OF FRESH-WATER CRUSTACEANS: I. THE IDENTIFICATION AND THE EXAMINATION OF THEIR PATHOGENICITY,
Niigata Univ. (Japan). Dept. of Medical Zoology.
H. Hasegawa, T. Shiraki, and M. Kemmotsu.
Jpn J Parasitol 25(4), p 254-261, 1976.

Descriptors: *Nematodes, *Crustaceans, *Pollutant identification, Pathology, *Fish parasites, Shrimp, Larvae, Water pollution, *Parasitism.
Identifiers: Anisogamarus-Annandalei, Paratya-Compressa-Improvisa, Spirurid, Streptocara-Crassicauda.

Spirurid larvae parasitic on fresh-water crustaceans were identified to elucidate the possibility of their larva migrans. The larvae were collected from Paratya compressa improvisa (edible shrimp) and Anisogammarus annandalei. Larvae from A. annandalei developed to adults under the cuticular lining of the gizzard of chickens and ducklings when the larvae were orally inoculated, and they were identified as Streptocara crassicauda (Creplin, 1829) (Spiruridae: Acuariidae) by morphological characteristics. Larvae of P. compressa improvisa were not recovered in such experimentally infected avian hosts. Although infection to the birds indicated an apparent difference between the spirurid larvae from the 2 crustaceans, both larvae might be the same species because their morphological features were identical. To obtain positive evidence of their pathogenicity in the human body, the larvae were confined in the lumen of a surgically isolated intestinal tract - a small piece of intestine of rat or guinea pig ligated on oth ends and enclosed in the abdominal cavity of the host animal. The closed tract was investigated 3 or 6 h after the operation to confirm whether the larvae invaded the wall. Some larvae migrated to the intestinal wall or through it to the abdominal cavity. A kind of visceral larva migrans with these larvae may be caused by eating raw the intermediate hosts, such as some fresh-water shrimps or possible paratenic hosts, such as some fishes.--Copyright 1977, Biological Abstracts, Inc.

PIGMENT CYCLE IN A NORTH GERMAN LAKE,
H. Rai.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1220-1228, 1975. 3 fig., 2 tab., 15 ref.

Descriptors: Chromatography, Fluorometry, *Chlorophyll, *Measurement, *Pigments, *Degradation(Decomposition), Freshwater, Europe, Spatial distribution, *Lakes.
Identifiers: *Pluss See(Germany), Phaeopigments.

General distribution patterns of chlorophyll and phaeopigments were determined in Pluss See, germany, in an effort to overcome significant errors in chlorophyll estimations by fluorometric or trichromatic spectrophotometry sometimes caused by chlorophyll degradation products. The error depends on portions of the compounds relative to chlorophyll; if no corrections are made for phaeopigments the chlorphyll values would be greater by the amount of phaeopigments. The presence of even very small phaeopigment quantities will give erroneous results because they absorb light in the same spectral region as chlorophyll. Fluorometric studies in the lake indicated that the maximum chlorphyll concentration was usually in the euphotic zone and at times coincided with that of the phaeopigments. Phaeopigments maximally occurred above the portion of the water column where nutrient concentrations increased and chlorophyll degradation increased with percentage of depth. The seasonal cycle of chlorophyll and their degradation products showed a bimodal pattern with the phaeopigments consituting a significant fraction of the chlorophylls. It is concluded that post-lytic photochemical oxidation could be responsible to a large extent for chlorophyll decomposition products in lakes. Chlorophyll derivatives, especially phaeophytins and phaeophobides, have been detected chromatographically. (Auen-Wisconsin)

A SURVEY OF THE PHYSICAL AND CHEMICAL LIMNOLOGY OF LAKE TITICACA,
P. J. Richerson, C. Widmer, T. Kittel, and A. Landa.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1408-1503, 1975. 4 fig., 1 tab., 9 ref.

Descriptors: *Physical properties, *Chemical properties, *Lakes, *Tropical regions, South America, Thermal stratification, Water temperature, Secchi disks, Dissolved oxygen, Light penetration, Heat budget, Ions, Cations, Elevation, Basic data collections.
Identifiers: *Lake Titicaca(Peru-Bolivia).

Lake Titicaca is located in the southern tropics (Peru-Boliva) at an elevation of 3800 m, with a surface area of 7800 sq km. The annual range of monthly mean temperatures is small compared to the diurnal range, with minimum winter air temperatures rarely dropping below -5C. Evaporation accounts for 95% of the water lost from the lake; the rest flows out through the Rio Desaguadero. It is classified as a warm monomictic lake; the low concentrations of dissolved oxygen and high concentrations of silica at 150 to 200m before and after mixing indicate that the lake probably mixes down to at least 150 m. The lakes's annual heat budget is low and the heat balance is potentially sensitive to small variations of input and output from year to year. Secchi disk depth was 4.5-5 m in February, but as the rainy season ended, clarity increased and the Secchi depth reached 10.5 in August; with the onset of light spring rains in September, followed by increased phytoplankton biomass, Secchi depth decreased to 6 m by December. Extinction coefficients followed a pattern influenced by rainfall during the first half of the year and by photoplankton biomass during the latter half. Major ion concentrations varied only slightly. SEDIMENT RESPIRATION IN SIX ITALIAN LAKES IN DIFFERENT TROPHIC CONDITIONS,
A. Provini.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1313-1318, 1975. 2 fig., 2 tab., 4 ref.

Descriptors: *Lake sediments, *Respiration, *Hypolimnion, *Biochemical oxygen demand, *Trophic level, Oxygen sag, Water temperature, Depth, Europe, Lakes.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: Lake Montorfano(Italy), Lake Alserio(Italy), Lake Pusiano(Italy), Lake Segrino(Italy), Lake Annone(Italy), Lake Oggiono(Italy), *Italy.

Lake sediment respiration was measured in six Italian lakes, five eutrophic and one oligomesotrophic, to determine hypolimnetic oxygen depletion from the late winter overturn to the appearance of anoxic conditions between March-July. At the end of the overturn, oxygen uptake of the five eutrophic lakes was about 20 mg/sq m/hr; consumption in the oligomesotrophic lake equaled 12 mg/sq m/hr. Differences in algae, bacteria and invertebrate species seemed of secondary importance in affecting oxygen uptake, but oxygen concentration in the overlying water and temperature are the major forces in the sediment respiration process. The data suggest that the oxygen uptake rate of sediments is not a useful parameter for trophic classification for stratified lakes because the uptake rate is mainly dependent upon the physiographic and climatic characteristics. Biochemical oxygen demand (BOD) measurments in the deep waters were consistent with the trophic level and lake depth for each lake. Generally, anoxic conditions ranged in the same order as primary production capacity and mean water oxygen demand, except for Lake Pusiano; the latter is both the most productive and the deepest of the six lakes and thus has a larger hypolimnetic oxygen reserve and lower BOD of the hypolimnion. TRIPTON SEDIMENTATION IN EUTROPHIC LAKES--SAMPLE CORRECTION FOR THE RESUSPENDED MATTER,
A. Gasith.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 116-122, 1975. 2 fig., 3 tab., 11 ref.

Descriptors: *Sedimentation, *Tripton, *Suspension, *Sedimentation rates, *Analytical techniques, *Equations, Seston, Estimating, Lakes, Lake sediments, Pollutant identification, *Eutrophication.

Errors in estimations of tripton sedimentation measured by the suspended-containers technique, caused by interference by resuspended bottom deposits, can be eliminated by application of a correction formula based on differences between the organic fraction of tripton and that of resuspended sediment. In a control experiment for the evaluation of the correction technique, the recovery of the calculated tripton compared to the measured tripton was 95.6%. The correction formula allows extension of the technique to shallow bodies of water and eliminates the requirement for calm water conditions during tripton collections. The suggested correction can be applied only in cases of short-term trap exposure, preferably one day, during which grazing and decomposition of the material collected in the traps is presumed negligible. In deep lakes where the surface sediment is usually stratified, correction for occasional mixing and resuspension of bottom deposits may require more discrete sampling of the surface sediment for determination of the organic fraction of the resuspended matter. In addition to its application for suspended matter, the formula could be applied to distinguish between any two sources of organic matter which are significantly different in their organic content. ALGAL SEDIMENTATION: THE CAUSE OF A DIATOM-BLUE-GREEN SUCCESSION,
R. Knoechel, and J. Kalff.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 745-754, 1975. 7 fig., 2 tab., 16 ref.

Descriptors: *Phytoplankton, *Succession, *Sedimentation, *Radioactivity techniques, *Primary productivity, Radiochemical analysis, *Canada, Anabaena, *Cyanophyta, *Diatoms, Trophic level, Dominant organisms, Lakes.
Identifiers: *Track autoradiography, *Lac Hertel(Quebec).

Application was made for the first time of track autoradiography to the study of aquatic primary production, in an examination of a system of succession where Tabellaria fenestrata (Lyngbye) Kuetzing is replaced by Anabaena plactonica Brunnth. Experiments were carried out in Lac Hertel, a small undisturbed naturally eutrophic lake near Montreal, Quebec. Carbon-14 content of individual cells of the slide-mounted material from samples was measured by track autoradiography, wherein a thick layer (greater than 30 microns) of photographic emulsion records the passage of a beta particle as a visible string of silver grains. Samples were concentrated on slides in a similar manner to those for cell counts and were then dipped in Kodak NRB-3 nuclear emulsion. Following exposure the slides were processed by Kodak K-19 developer. Track counts were normally made on at least 100 cells of Tabellaria per slide and on 25 cell sections of 20 Anabaena filaments. The results permitted calculation of daily growth rates of the individual species. The decline of the summer diatom population (Tabellaria) appears to be the result of a high sinking rate rather than a low production rate. In contrast the blue-green algal popultion(Anabaena) continues to increase due to a lower sinking rate. (Harris-Wisconsin)

POPULATION CHANGES IN THE AQUATIC FAUNA INHABITING THE BLADDERWORT, UTRICULARIA FLEXUOSA VAHL., IN A TROPICAL SWAMP, TASEK BERA, MALAYSIA,
R. P. Lim, and J. I. Furtado.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1390-1397, 1975. 3 fig., 2 tab., 13 ref.

Descriptors: *Monsoons, *Swamps, *Ecosystems, Biological communities, Aquatic plants, *Biomass, *Productivity, *Succession, Wet climates, Wet seasons, Wetlands, Foreign countries, Seasonal, Food chains, Standing crops, Population, Crustaceans, Fish, Larvae, Tropical regions.
Identifiers: *Tasek Bera Swamp(Malaysia), *Utricularia flexuosa Vahl, Tropical swamps.

A quantitative study of the macro- and microfauna inhabiting the bladderwort Utricularia flexuosa Vahl was made over a period of nine months in Tasek Bera, a Malaysian tropical swamp. An objective of the study was to learn how Tasek Bera, itself poor in nutrients, plankton and benthic organisms, can nevertheless support a diversified fish fauna which feeds on aquatic insects and zooplankton. It was found that curstaceans, fish, odonate larvae and dipteran larvae predominate in the biota associated with Utricularia. Similar dominant groups (with the exception of the fish) had been found in Ceratophyllum, a finely-dissected plant studied earlier. Seasonal fluctuations in the Utricularia mat and the populations of the biota associated with it were obviously unaffected by the twice-annual monsoons. Large portions of the mats were washed away at the beginning of each monsoon and only when the bladderwort reestablished itself during the dry season did the periphyton and debris accumulate. These then provide the substrate for a detritrivorous and herbivorous microfauna, which in turn provided the substrate for a canivorous macrofauna. This community provided a concentrated food source for larger transient grazers and predators, especially fish. Thus, the rich standing crop of the Utricularia community contributed significantly to the Tasek Bera swamp ecosystem. (Harris-Wisconsin)

EFFECT OF NUTRIENT ENRICHMENT ON THE HETEROTROPHIC UPTAKE OF ORGANIC SOLUTES BY MICROORGANISMS,
K. J. Hall.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part I, p. 280-285, 1975. 1 fig., 3 tab., 14 ref.

Descriptors: *Primary productivity, *Nutrients, *Kinetics, *Absorption, *Measurement, *Eutrophication, Food chains, Lakes, Microorganisms, Bays, *Lake Ontario.
Identifiers: *Bay of Quinte(Lake Ontario), Limnocorrals, Michaelis-Menten enzyme kinetics, *Organic solutes.

As part of an ongoing study of the effects of nutrient enrichment on the trophic dynamics of the food chain process in the aquatic environment, net uptake and mineralization of the radioactive solutes glucose, glycine and acetate by microorganisms in the water and sediments were measured in three limnocorrals located in the Bay of Quinte, Lake Ontario during summer 1973. The bay is a shallow arm on the north shore of the lake and is connected by a very narrow channel to the main lake. Little water is exchanged between the lake and the bay. The slow exchange, coupled with nutrient input from agriculture and urban development, has caused algal blooms in recent years. In the study, limnocorrals (plastic enclosures) were anchored in the bay in 4 m of water. Each was triangular, measuring 25 ft per side, and contained approximately 100,000 l of water. One limnocorral served as a control and the others were enriched with either phosphorus or nitrogen + phosphorus. Uptake rates and turnover times were determined using the techniques of modified Michaelis-Menten enzyme kinetics. Preliminary results indicate higher levels of heterotrophic activity in the nutrient-enriched limnocorrals. The sediment microorganisms demonstrated much higher levels of activity than the water column bacteria. (Harris-Wisconsin)
W77-07466

SEASONAL VARIATION IN SEDIMENT-WATER EXCHANGE OF NUTRIENT IONS IN LAKE ESROM,
L. Kamp-Nielsen.
Verhandlungen Internationale Verinigung Limnologie, Vol. 19, Part II, p. 1057-1065, 1975. 16 fig., 7 ref.

Descriptors: *Cycling nutrients, *Ion exchange, *Sediment-water interfaces, *Seasonal, Sedimentation rates, Temperature, Thermoperiodism, Oxidation-reduction potential, Foreign countries, Foreign research, Littoral, Profundal zone, Lakes, Ions.
Identifiers: *Lake Esrom(Denmark).

In an effort to study the relative importance of the processes involved in nutrient ion exchange under the influence of seasonal differences in temperature, rate of sedimentation and composition of the sediment surface, undisturbed sediment cores were collected each month for one year from the littoral and from the profundal zones in Lake Esrom, Denmark. Exchange rates were calculated for two week periods at the temperaturs found in the lake. Data for the seasonal variation in vertical distribution of temperature, pH, oxygen, primary production and other sedimentation data were obtained from another ongoing research project. Results showed that exchange rates of nutrient ions across the sediment surface are mainly governed by temperature and sedimentation rate and only to some smaller extent by the variation in redox conditions and pH. The spring maximum in primary production in March-April is followed by

a high rate of sedimantation from April 15 to June. Due to increasing surface and bottom temperature in this period the decomposition of the sedimented organic matter accelerates. This is reflcted in the maximum release in June of all the studied ions. The exchange between bottom water and profundal sediment is to some extent influenced by the redox conditions during the summer stagnation. However, during most of the year the profundal nutrient exchange follows the variation in temperature and sedimentation. The most distinct temperature depenpence is seen in the case of silicate exchange. (Harris-Wisconsin)

THE UTILIZATION OF THE GREEN ALGA DICTYOSPHAERIUM PULCHELLUM AS FOOD FOR CERTAIN CRUSTACEANS OF FRESH WATER PLANKTON,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
R. Zurek.
Acta Hydrobiologica, Vol. 18, No. 1, p. 53-59, 1976. 5 fig., 1 tab., 9 ref.

Descriptors: *Chlorophyta, *Crustaceans, *Feeding rates, *Nitrogen compounds, Foods, *Plankton, Growth rates, *Food chains, *Nutrients, Sewage, Fertilizers.
Identifiers: *Dictyosphaerium pulchellum, Nutrient value.

The nutritive value of the green alga Dictyosphaerium pulchellum was investigated as a food for Daphnia longispina, D. magna, Simocephalus vetulus, Scapholeberis nucronata (Cladocera, Phyllopoda), Notodroma monacha (Ostracoda), Macrocyclops fuscus (Cyclopoida, Copepoda), and Diatpmus sp. (Calanoida, Copepoda). D. pulchellum was selected because it develops very well in diluted sewage containing large amounts of nitrogen compounds. Out of the seven crustaceans tested only Daphnia magna consumed Dictyosphaerium pulchellum in an amount attaining almost 16% of its body weight. The other species consumed very little of the alga. The nutritive value of the green alga was evaluated on the basis of the assimilation index, Ca/W bar=(R2)(Cr)(2400))/W bar %, where R2 is the sum of the animals' activity after the excretion of food and of the activity of respirated carbon in impulse/hr/individual, Cr is the reverse of specific activity in milligrams of dry weight per impulse, and W bar is the mean dry weight of an animal in mg. Assimilation indices were less than 1% for all species suggesting poor suitability of the alga for the crustaceans examined. (Luedtke-Wisconsin)

AN ORGANIC CARBON BUDGET FOR AN OLIGOTROPHIC LAKE IN NEW HAMPSHIRE, U.S.A.,
M. Jordan, and G. E. Likens.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 994-1003, 1975. 3 fig., 3 tab., 23 ref.

Descriptors: *Carbon cycle, *Lakes, *Trophic level, *Eutrophication, Limnology, *New Hampshire, Phytoplankton, *Oligotrophy, *Pollutant identification, Gas chromatography.
Identifiers: *Mirror Lake(NH), *Organic carbon budget, Dissolved inorganic carbon, Dissolved organic carbon, Fine particulate organic carbon.

A complete organic carbon balance is presented for Mirror Lake, a small (15 ha) lake with a mean depth of 5.57 m and a maximum depth of 10.9 m with a mountainous, granitic drainage basin. The water is nutrient-poor, slightly acid and oligotrophic. The lake is usually dimictic and is ice-covered from mid-December to mid-April. In summer the thermocline is at a depth of 4-5 m and oxygen concentrations in the hypolimnion are often less than 0.5 ppm. Dissolved inorganic carbon (DIC) ranges from 0.84 to 5.88 mg C/1. Dissolved organic carbon (DOC) and fine particulate organic carbon were determined with an infrared gas analyzer. DIC was determined by gas chromatography. Results of these and other budgetary measurements show that autochthonous sources represent 83% of the total organic carbon inputs for the lake. Phytoplankton are the major producers, accounting for 90% of autochthonous inputs. Fluvial DOC is the most important allochthonous carbon source(47%). Of the total carbon inputs, 83% are lost through respiration, 7% by sedimentation and 10% by fluvial outputs. Parts of the budget are considered tentative, awaiting further studies on the lake. (Harris-Wisconsin).

ALGAL PRODUCTIVITY OF NATURAL AND ARTIFICIALLY ENRICHED FRESH WATERS IN MALAYA,
J. L. Richardson, and L. T. Jin.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1383-1389, 1975. 1 fig., 2 tab., 4 ref.

Descriptors: *Tropical regions, *Eutrophication, *Oligotrophy, *Fish farming productivity, Algae, Aquatic plants, Ponds, Photosynthesis, Electrical conductance, Soil types, Asia, Lakes.
Identifiers: *Malaya, Aquatic plant utilization.

Algal productivity in two natural lakes, several man-made reservoirs, fish culture ponds, and pools left by mining operations on the Malay Peninsula is described. The greatest contrasts were those between waters not intentionally enriched and those fertilized for fish culture. When unenriched by human activities, Mala yan waters have low algal production because local soils are mostly part granite, are highly leached and usually deep; this is in contrast to many other tropical areas that support productive lakes from young, volcanic soils and grassland wild animal habitats. Nutrient enrichment, however, has a marked effect on productivity. A pond fertilized for fish culture for three years more than doubled its conductivity and its algal production increased 14-fold. Rural inhabitants use both mining pools and specially-constructed shallow ponds for fish culture, and traditionally raise pigs and ducks as part of an integrated complex. Aquatic macrophytes are harvested from the pond and boiled down to form food for the pigs. Wastes from the sty are washed into the pond, promoting vigorous growth not only of macrophytes for the pigs but of algae which directly or indirectly feed the carp and ducks. Maximal production was recorded in a fish pond only 40 cm deep; rates near the surface were 18.7 mg oxygen/1/hr (gross) and 17.2 mg oxygen/1/hr (net). (Auen-Wisconsin).

POST-GLACIAL HISTORY OF MIRROR LAKE AND ITS WATERSHED IN NEW HAMPSHIRE, U.S.A.: AN INITIAL REPORT,
G. E. Likens, and M. B. Davis.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 982-993, 1975. 5 fig., 2 tab., 42 ref.

Descriptors: *Paleolimnology, *Sampling, *Cores, Lake sediments, *Lake basins, *New Hampshire, Sedimentation, Bottom sediments, Bottom sampling, Forest watersheds, Pollen, Glaciation, Pollutant identification.
Identifiers: *Mirror Lake(NH), Pollen analysis.

Analyses were made of a continous sediment core of 12.42 m length from near the center of Mirror Lake, New Hampshire, a small (15 ha) lake with a mean depth of 5.57 m and a maximum depth of 10.9 m with a mountainous, granitic drainage basin. The deposits represented an opportunity to quantify historical linkages between the lake and its terrestial watershed, using output data from the surrounding area. Samples of the sediment, carbon-14 dated at about 11,300 years old, were analyzed for organic carbon, total sulphur, phosphorus, and total calcium, magnesium, sodium, potassium, copper, zinc, aluminum and iron. Extractable amounts of the latter eight elements were determined by a separate technique. Pollen samples were also taken for analysis. As a result of analyses of the sample, the sediment profile of the lake was divided into four zones: Zone I, late glacial, extends from the bottom (1,242 cm) to about 1,125 cm and spans about 2,000 years (11,300-9,300 B.P.); Zone II, early post-glacial, extends from 1,125 cm to about 560 cm and spans about 4,500 years (9,300-4,800 B.P); Zone III, late post-glacial, extends from 560 cm to about 25 cm and spans about 4,600 years (4,800-200 B.P.); Zone IV, the recent cultural horizon, extends from 25 cm to the mud-water interface and spans about 200 years (200 B.P. to present). The fossil record of phytoplankton in the lake is presently being separately studied, in an effort to provide a better record of historical nutrient levels in the water. (Harris-Wisconsin).

THE STRUCTURE OF PHYTOPLANKTON ASSOCIATIONS IN LAKE TAHOE (CALIFORNIA-NEVADA),
P. J. Richerson, B. J. Dozier, and B. T. Maeda.
Verhandlungen International Vereinigung Limnologie, Vol. 19, Part II, p. 843-849, 1975. 5 fig., 19 ref. NSF GA-34099.

Descriptors: *Phytoplankton, *Biological communities, *Distribution patterns, *Environmental effects, Spatial distribution, Correlation analysis, California, Nevada.
Identifiers: *Lake Tahoe(Calif-Nev), Phytoplankton associations.

Phytoplankton associations and their diversity as related to the physical environment were investigated in Lake Tahoe and its Emerald Bay (essentially a separate lake, about 1/10th of the dimension of the main lake, connected over a 2.5 m-deep sill). These 1973 observations were a portion of a larger study to relate phytoplankton distribution as directly as possible to physical environmental conditions. Physical measurements included current speed, current fluctuations and temperature structure. Biological measurements included in-situ chlorophyll fluorescence and phytoplankton sample enumeration. Diversity spectra were analyzed by several techniques, including averaged and unaveraged methods. The observations confirmed the existence of spatial heterogeneity in phytoplankton associations. Even in the horizontal direction, patterns may exist on length scales ranging downward to about 200 m. The results were generally consistent both with the comparisons of chlorophyll and with turbulence measurements which showed divergence in the spectral form of chlorophyll and velocity variance at similar length scales. The cause for the lack of regular variation in phytoplankton community structure observed is obscure. (Auen-Wisconsin).

AREAL DISTRIBUTION AND STRATIGRAPHY OF DIATOMS IN THE SEDIMENTS OF LAKE SALLIE, MINNESOTA,
Geological Survey, Lakewood, Colo. Water Resources Div.; and Geological Survey, Denver, Colo. Geologic Div.
J. P. Bradbury, and T. C. Winter.
Ecology, Vol 57, No 5, p 1005-1014, 1976. 7 fig, 2 tab, 21 ref.

Descriptors: *Diatoms, *Ecology, *Eutrophication, *Lakes, *Sediments, Limnology, *Minnesota, Paleolimnology, Stratigraphy, Areal, Distribution.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *Lake Sallie(Minn), *Areal distribution.

The patterns of modern diatom sedimentation in presently eutrophic Lake Sallie, Minnesota, have aided in elucidating the trophic changes in the lake caused by man's activities since the 1870s. The modern sedimentation patterns were determined from a transect of surface sediment samples taken through littoral and profundal zones of the lake and the trophic history is interpreted from the diatom content of two lake-sediment cores. The transect shows that, in this lake, diatom valves are mostly deposited in the area of their living habitats and are not homogeneously redistributed by lake currents. Planktonic diatoms Stephanodiscus sp. cf. S. hantzschii, Stephanodiscus niagarae, and Melosira granulata dominate in the profundal sediments, and sessile Fragilaria species characterize the sediments beneath the littoral habitat. Fragilaria construens var. binodis prefers nutrient-rich water entering the littoral zone near the inflow of the Pelican River, a stream carrying secondary sewage effluent from the town of Detroit Lakes. The Diatom stratigraphy indicates that the benthic and planktonic diatom communities have changed in species composition and probably in productivity as a result of cultural eutrophication. Spring-blooming Stephanodiscus sp. cf. S. hantzschii dominates the post-settlement record. A core near the Pelican River inflow shows a marked increase in Fragilaria construens var. binodis that probably reflects increased nutrient levels during the most recent history of Lake Sallie. ASPECTS OF ZOOBENTHOS ECOLOGY OF THE MACKENZIE DELTA, N.W.T.,
N. B. Snow, and P. Chang.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1562-1567, 1975. 1 fig., 3 tab., 6 ref.

Descriptors: *Deltas, *Benthic fauna, *Canada, Varieties, Aquatic insects, Mollusks, Copepods, Crustaceans, Invertebrates, Estuaries, Arctic, Natural gas, Oil spills.
Identifiers: *Mackenzie Delta(NWT).

The 13,000 sq km Mackenzie Delta in the Canadian Artic area is a complex of sinuous channels and approximately half a million lakes, 95% of which are flood plain lakes. This investigation represents a preliminary data base of the region's aquatic fauna and factors controlling their distribution and abundance. Some macrophyte, phytoplankton and zooplankton collections were also made. Concern for the area is generated by hazards resulting from oil and gas development spills. The channels are impoverished habitates dominated by chironomid, ceratopogonid and caddis larvae and oligochaetes. Lake mollusc species are dominated by pelecypods, except for one Pisidium species which was peculiar to turbid lakes, and P. ferrugineum which was only found in clear lakes, Castropods showed a distinct separation into clear and turbid lake forms. Only four species occurred in both lake types, with greater diversity in clear lakes. Caddis larvae were distinctly separated into lake and channel species. Phryganeids dominated in lakes and hydropsychids predominated in channels. Two species of tanypodine chironomids were ubiquitous, but Tanypus was only found in clear lakes. Tanytarsine chironomids attained maximun numbers in lakes but one Tanytarsus and a Paratanytarsus species are ubiquitous. A single Diamesine species was found in turbid waters only. The dominant copepoda, cladocera, molluscs and insects and their habitats are listed. (Auen-Wisconsin).

PRELIMINARY ESTIMATES OF PRODUCTION BY A CALANOID COPEPOD IN SUBTROPICAL LAKE SIBAYA,
R. C. Hart, and B. R. Allanson.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1434-1441, 1975. 4 fig., 2 tab., 13 ref.

Descriptors: *Productivity, *Zooplankton, *Subtropic, *Copepods, Growth rates, Standing crops, *Africa, Estimating, Analytical techniques, Lakes.
Identifiers: *Lake Sibaya(South Africa), *Pseudodiaptomus hessei.

This production assessment of the copepod Pseudodiaptomus hessei represents an initial investigation of subtropical zooplankton productivity as exemplified in oligotrophic Lake Sibaya, South Africa. Data is given for egg development rates, duration of naupliar and copepodite instars, length-weight determinations, population age structure, standing stock and production. Mean standing crop of the 27-month investigation period was 5.704 mg dry wt/cu m and mean daily production was 2.458 and 0.634 mg dry wt/cu m/day, computed by Elster's and Winberg's methods respectively. Mean daily P/B ratios were 0.43 and 0.11. Seasonal changes in production of P. hessei correlate better with temperature than with chlorophyll, however an interaction of temperature and food availability is involved. Little is known of the subtropical or tropical zooplankton production. A 1971 study on Lake George, Uganda, reflects a highly eutrophic system unlike Sibaya, where the mean daily production of Thermocyclops hyalinus is more than 750 times as great as that of P. hessei on unit volume basis and nearly 140 times as great on unit area basis. The low P. hessei production in Lake Sibaya almost certainly reflects its inherent paucity, particularly of nitrogen and phosphorus, which lies on and is surrounded by recently exposed marine sands. CHANGES IN PHYTOPLANKTON SPECIES COMPOSITION SINCE 1894 IN TWO LAKES IN EAST-HOLSTEIN, GERMANY,
B. Hickel.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1229-1240, 1975. 2 fig., 6 tab., 39 ref.

Descriptors: *Speciation, Phytoplankton, *Algae, *Biological communities, *Baseline studies, Foreign countries, Varieties, Eutrophication, Ecotypes, Lakes.
Identifiers: *Plussee(Germany), *Grosser Ploener See(Germany).

Data from two lakes in northern Germany are among the few examples of long-term phytoplankton investigations which enable a comparison of species composition over more than 50 years. The first plankton composition in Grosser Ploener See and in the Plussee, located in East-Holstein, Germany, were recorded in 1894 just before the onset of eutrophication. Comparisons are based on investigations during the years 1894-1908, 1921-1925 and 1929, and the most recent starting in 1964. These two lakes are naturally eutrophic and their trophic status has been further enhanced by agricultural runoff and from various other sources. Two tables list the phytoplankton species for the three investigation periods, showing marked changes in species composition and dominance. The number of species in the Plussee has decreased markedly within the last 80 years, but in the Grosser Ploener See it has remained almost constant (two species more than in 1893-1901). In the Plussee the number of chlorococcal green algae species has decreased whereas in the Grosser Ploener See they have increased. (Auen-Wisconsin)

THE EFFECT OF FOOD CONCENTRATION AND TEMPERATURE ON RESPIRATION AND EXCRETION IN HERBIVOROUS ZOOPLANKTON,
E. J. LaRow, J. W. Wilkinson, and K. D. Kumar.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 966-973, 1975. 3 fig., 1 tab., 20 ref. NSF AG-199, BMS 69-01147 A 09.

Descriptors: *Zooplankton, *Metabolism, *Respiration, *Water temperature, Food abundance, *Nitrogen, *Phosphorus, *Daphnia, Copepods, Statistical methods, New York, Lakes.
Identifiers: Excretion, Daphnia galatea mandotae, Diaptomus siciloides, *Lake George(NY).

Experiments are described which were designed to estimate effects of temperature and food concentrations on respiration and on nitrogen and phosphorus excretion for zooplankton, in the Lake George (N.Y.) ecosystem using Daphnia galatea mendotae and Diaptomus siciloides. The initial hypothesis was that respiration and excretion would directly reflect changes in feeding rates when organisms were exposed to different food concentrations. The latter have been shown to be curvilinear. However the resultant data were not curvilinear but linear in nature. The possible explanation for the linear response is that the experimental food levels were below the incipient level of food concentration. The organisms were starved for 48 hours prior to feeding experiments, causing them to feed at abnormally high rates for a short period of time. Hence what appears to be an exceptionally high incipient food concentration level is most likely an artifact due to the physiologically stressed organisms. Functional rates obtained in these experiments were generally greater than those reported in the literature but respiration values for all species, as well as the Daphnia excretion values, fell within the range of reported values. Comparative literature for limnoplankton respiration and excretion are presented, with data sets listing mean values for five replicates under each of the experimental conditions for both nitrogen and phosphorus excretion and respiration. (Auen-Wisconsin)

A SURVEY OF THE BIOLOGICAL LIMNOLOGY OF LAKE TITICACA,
C. Widner, T. Kittel, and P. J. Richerson.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1504-1510, 1975. 4 fig., 2 tab., 17 ref.

Descriptors: *Primary productivity, *Tropical regions, *South America, Biological communities, Lakes, Zooplankton, Phytoplankton, Biomass, Silica, Limnology.
Identifiers: *Lake Titicaca(Peru), Bolivia.

Lake Titicaca (Peru) supports an abundant and varied flora and fauna and provides important food resources for a human population of nearly one million local rural residents. Rainbow trout and silversides also supply the restaurants of near-

by Peruvian and Bolivian cities. The lake is situated at 3800 m altitude, impounds 820 cu km of water, with a total surface area of 7800 sq km and a maximum depth of 280 m. Primary production, phytoplankton, and zooplankton populations were generally sampled at 100 m depths. Annual primary production was 529 g/C sq m and biomass production was calculated at a conservative 4.02 million metric tons. Changes in phytoplankton populations tended to reflect changes in production. Zooplankton populations, dominated by Boeckella titicacae, varied little throughout the year. The general pattern of biological processes in Lake Titicaca resembled those of tropical East African lakes, especially Lake Victoria, as the low seasonal variations dampen the usual annual patterns of higher latitude lakes. Productivity varied relatively little and seasonal changes in the phytoplankton and zooplankton were muted. The general stimulatory effect of tropic latitudes on species diversity seemed to be directly reversed in the zooplankton assemblages, perhaps because of a strong temporal component in zooplankton niches. (Auen-Wisconsin)

LAKE IZABAL, GUATEMALA,
M. M. Brinson, and F. G. Nordlie.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1468-1479, 1975. 5 fig., 4 tab., 16 ref.

Descriptors: *Lakes, *Tropical regions, *Limnology, Rainfall, Areal hydrogeology, Geology, Bathymetry, Hydrology, Hydrologic budget, Water chemistry, Plankton, Benthos, Water temperature, Varieties, Fishing, Primary productivity.
Identifiers: *Lake Izabal(Guatemala), Central America, Guatemala, Polymictic lakes.

Limnological characteristics of tropical, lowland, polymictic Lake Izabal (Guatemala) are described. The lake lies a few meters above sea level, in a broad, nearly flat plain, has a maximum depth of 16 m near the center; thus most of its volume is below sea level. Most of the 50 rivers and streams discharge into the lake's eastern, northern and southern edges, but the greatest volume of water is received through the massive Polochic Delta to the west. The lake's outlet is at the northeastern extremity, where the Rio Dulce continues the drainage to Amatique Bay in the Gulf of Hunduras on the Carribean Sea. Two mountain ranges delimit the Izabal hydrologic unit--the Sierra de las Minas and the Montanas del Mico life end-to-end and parallel the southern boundary, while the Sierra de Santa Cruz and Sierra Chama create the divide to the north. Details are given of climate, (including rainfall), geology, bathymetry and hydrology, water temperature, water chemistry, and the planktonic and benthic communities. Dominant net plankton are diatoms, cyanphytes, chlorophytes, cladocerans, copepods, and rotifers. Fishing is of local importance, but is threatened by overexploitation. The annual gross primary productivity was estimated at 1400 g oxygen/sq m during 1972. (Auen-Wisconsin)
W77-07504

ANNUAL CONTRIBUTION OF CARBON, NITROGEN AND PHOSPHORUS BY MIGRANT CANADA GEESE TO A HARDWATER LAKE,
B. A. Manny, R. G. Wetzel, and W. C. Johnson.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 949-951, 1975. 7 ref. AEC AT-(11-1)-1599, COO-1599-84, NSF GB-28900X.

Descriptors: *Geese(Wild), *Nutrients, *Eutrophication, Waterfowl, *Carbon, *Nitrogen, *Phosphorus, Michigan, Canada goose, Animal wastes(Wildlife), Lakes.
Identifiers: *Non-point pollution, *Wintergreen Lake(Mich), Bird droppings.

The hypereutrophic condition of Wintergreen Lake, Michigan, is attributed to the droppings of more than 6000 migrant Canada geese which rest for 3-10 days during March, October, November and December on this 15-hectare hardwater lake. This nutrient source was measured on January 9-11, 1970 when the geese rested in a clearly-defined area on newly fallen snow covering the frozen lake. The average weight of the geese was 2.56 kg. During the three-day study each goose defecated an average dropping weighing 5.56 grams wet weight, or 1.17 g dry weight, 28 times per day. The average dropping contained, by weight: 79.30% moisture, 24.14% dry ash, 75.86% dry carbon, 4.38% dry nitrogen, and 1.34% dry phosphorus. Using a four-year average of 134,447 effective goose-use days, the average defecation rate of 28 times per goose, the average dry weight of a goose dropping of 1.17 g, and the average percentages of carbon, nitrogen, and phosphorus, migrant Canada geese were calculated to contribute 4404.8 kg dry weight of feces, 3341.24 kg of carbon, 192.92 kg nitrogen, and 59.02 kg phosphorus each year to Wintergreen Lake. These estimates do not include nutrients contributed to the lake by the year-round resident flock of 200 Canada geese or the more than 4200 mallard and diving ducks which use the lake each year. (Auen-Wisconsin)

UPTAKE AND RETENTION OF KUWAIT CRUDE OIL AND ITS EFFECTS ON OXYGEN UPTAKE BY THE SOFT-SHELL CLAM, MYA ARENARIA,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Marine Ecology Lab.
W. C. Fong.
Journal of Fisheries Research Board of Canada, Vol. 33, No. 12, p. 2774-2780, 1976. 3 fig., 2 tab., 26 ref.

Descriptors: *Oil pollution, *Absorption, *Clams, Animal physiology, Respiration, Water pollution effects, *Canada, Oil spills, Water pollution effects.
Identifiers: Hydrocarbon effects, *Three Fathom Harbour(Nova Scotia).

This study, in which Mya arenaria from Three Fathom Harbour (Nova Scotia) were exposed to sea water to which crude oil had been added, tested the theory that the rate and extent of accumulation of petroleum hydrocarbons are affected by the lipid content of shellfish. Acute and prolonged exposure effects of oil on oxygen utilization by the soft-shell clams were also studied. The gills of this clam are capable of removing finely dispersed oil globules of 1-30 micrometer diameter from sea water along with food particles. Clams exposed to seawater concentrations of 90-380 microgram oil per liter for 10 days at 18C accumulated oil in their tissues. Concentrations incorporated are directly related to the lipid content of tissues. Approximately 6 mg oil per gram lipid was observed within the tissue of individual clams. Only one of three experiments demonstrated that Kuwait crude oil can cause significant increases in the respiratory rates of clams. Even these effects were only achieved in small clams (shell length 3.75-4.50 cm) after prolonged exposure to relatively high oil concentrations and high temperature (18C). Short-term exposure to high oil concentrations did not alter gill tissue respiration. Similarly, respiration rates of clams of various sizes were not significantly affected after exposure to low oil concentrations. (Auen-Wisconsin)

GRAZING EFFECTS ON NANNOPLANKTON IN GATUN LAKE, PANAMA,
E. T. Weers, and T. M. Zaret.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1480-1483, 1975. 2 tab., 5 ref. NSF GB 33396.

Descriptors: *Nannoplankton, *Grazing, *Zooplankton, Water chemistry, Food chains, Lakes.
Identifiers: *Gatun Lake(Panama Canal Zone), Ceriodaphnia cornuta, Diaptomus gatenensis.

Feeding habits of two abundant zooplankters, Ceriodaphnia cornuta and Diaptomus gatenensis, were experimentally investigated in an effort to relate their grazing to the 85% predominance of small green and blue-green phytoplankton cells in Gatun Lake in the Panama Canal Zone. The grazing decreased the nannoplankton species Cyclotella stelligera, Oocystis lacustris, Scenedesmus bifuga, Chroomonas, two chlorophytes, one flagellate, Synechocystis, and Dactylococcopsis irregularis. Ankistrodemus, one chlorophyta and two flagellates increased; Chrooccaceae cyanophyte and two other Cyanophytes did not change numerically. The unchanged species were spherical, probably all blue-greens with gelatinous matrices, and commonly 1-2 microns in diameter. They constituted an average of more than 75% of the total nannoplankton cells. Since these forms are well within the filtration range of these passively size-selective grazers, the presumption is that these dominant algal forms were ingested by the zooplankton but since their numbers were not reduced in the grazing experiments, they apparently were not eaten. The observations suggest that although in this lake any filter-feeding zooplankter will ingest a large number of algae particles, most have no nutritive value this explaining why the nannoplankton can maintain such numerical density. This may be the reason why the normal diurnal zooplankton densities rarely exceeded 10/l. (Auen-Wisconsin)
W77-07507

ROLE OF OLIGOCHAETES IN THE CIRCULATION OF WATER AND SOLUTES ACROSS THE MUD-WATER INTERFACE,
L. W. Wood.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1530-1533, 1975. 1 fig., 5 ref.

Descriptors: *Oligochaetes, *Mud-water interfaces, *Translocation, *Tracers, Rhodamine, New York, Water circulation, Path of pollutants.
Identifiers: *Canadarago Lake(NY).

The extent of movement water and dissolved materials from the water column into sediment by pumping action of oligochaetes was investigated in Lake Canadarago (New York), using rhodamine B as the tracer. The method relies on the high sorptive capacity and possible microbial degradation of the dye. A control experiment measured physical and microbial elimination of the dye and its results were used to determine the movement of water by the macroinvertebrates alone. While burrows exist to depths of 30-35 cm below the mud-water interface, work with tritiated water indicated that in reconstituted systems of 6 cm maximum depth, most of the circulation is limited to the upper 4 cm. This suggests that most of the pumping exchange by the oligochaetes may be related to respiratory rather than feeding movements. The results showed a considerable influx of water to the sediments, which must equal the volume of water containing solutes flushed from the sediments. In eutrophic Canadarago Lake the potential export of water from the sediments due to sludgeworm activity amounted to 51 to 107 ml/sq m/hr, thus they are not only ecologically important but are a factor in the transport of pollutants from the sediments to the water column. (Auen-Wisconsin)

STRATEGIES FOR EXISTENCE OF ZOOPLANKTON PREY IN HOMOGENEOUS ENVIRONMENTS,
T. M. Zaret.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1484-1489, 1975. 1 tab., 26 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Selectivity, *Lakes, *Predation, *Zooplankton, Behavior, Resistance, Movement, Vertical migration.
Identifiers: *Pelagic waters, *Prey behavior, Prey selection.

Predator avoidance behavior by zooplankton is discussed, especially in pelagic lake waters, as it relates to the selective factor of the prey population and community structure. Different types of selective pressures from visual predators (primarily vertebrates) and grasping predators (invertebrates) exploit. In those instances where the prey coexists with its predator, its avoidance mechanism is by vertical migration, i.e., the potential prey species remain in deep waters during the day and appear in the surface waters only when reduced light deters the light-dependent planktivores' feeding. This behavior is exemplified by the calanoid copepod Diaptomus gatunensis and by Daphnia. To avoid non-visual grasping predators, prey that are too large to be captured or handled effectively can escape. It has been shown that planktivorous fishes do not actually select individual prey according to body-size, but rather by total visible pigmentation, concentrated mainly in the large compound eye with the body-size usually a direct correlate. This type of predation pressure can lead to changes in composition within a single species, so that a second morph, having a reduced total pigmentation, may appear in the population when fish predation is heavy. Other predation avoidance strategies employed by rotifers and crustaceans are by direct swimming or reduced motility. (Auen-Wisconsin)

BACTERIOLOGICAL STUDIES IN THE CIENAGA GRANDE (GREAT MARSH) OF SANTA MARIA, COLUMBIA, (IN SPANISH),
R. Jeske.
Mitt Inst Colombo-Aleman Invest Cient 'Punta De Betin' 8, p 17-32, 1976.

Descriptors: *Bacteriology, Bacteria, South America, E. coli, *Aquatic bacteria, *Salmonella, Salinity, Marshes, Water pollution, *Salt marshes, Water pollution.
Identifiers: Crassostrea-Rhizophorae, *Columbia(Cienaga Grande), Santa Maria(Columbia).

Among the aquatic bacteria of the Cienaga Grande halophilic forms predominate in the salinity range of brackish water. Their number further rises while the salinity decreases during the rainy season. Only at salinities below 10‰, however, the fresh water bacteria increase. They reach a temporary maximum at about 3‰ salinity. At the same time the halophilic flora decreases. Using the intestinal bacterium Escherichia coli as an indicator, a certain degree of pollution can be detected near the fishing villages, and rarely in the rest of the lagoon. Oysters, Crassostrea rhizoforae (100), were examined for Salmonella and gave negative results. Of 6 water samples collected between the lake dwellings of Bocas de Aracataca, 4 contained Salmonella. The present degree of pollution of the Cienaga Grande is not alarming with respect to the oyster fishery.--Copyright 1977, Biological Abstracts, Inc.

THE LENTIC AND LOTIC FRESHWATER TYPES OF MARION ISLAND (SUB-ANTARCTIC): A LIMNOLOGICAL STUDY,
J. U. Grobbelaar.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 949-951, 1975. 3 fig., 2 tab., 8 ref.

Descriptors: *Limnology, *Subarctic, *Antarctic, Lakes, Rivers, Chemical properties, Productivity, Morphology, Streams, Ponds, Lentic environment, Lotic environment.
Identifiers: *Marion Island(South Atlantic Ocean), Sub-antarctic.

Limnological characteristics of subantarctic Marion Island are described, including water chemistry, productivity, morphology, and the ecology of the small crater lakes, lava-lakelets, wallows, rivulets, creeks or streams. The volcanic island, situated at 46 35'S and 37 45'L, is exposed to a cold, wet and windy climate. The lentic bodies are shallow, with the littoral zone usually extending over the entire basin, and covered by a benthic algal felt lining. Their shallowness and prevailing strong winds preclude thermal stratification. Wind and wave action resuspend sediments, causing high turbidity. Humic acids leach from the surrounding peat deposits coloring the water light brown. The pH is 5.88 and mineral content varies between 15.2-1335.3 mg/l total ions. The bicarbonate content is low and the average alkalinity is 0.11 milliequivalents/l. Nitrogen and phosphorus were detectable only in biotically-fertilized waters. Major components of these waters are sodium, potassium, calcium, manganese, chlorine and sulfate; minor components are alkalinity, iron, nitrate-nitrogen, ammonia-nitrogen, and total dissolved phosphorus. The major ions duplicate those of sea water because the constant winds deposit seaspray and condense seawater in raindrops. Primary production in abiotic waters is among the lowest recorded in the world--0.01-0.05%. There are only two trophic levels: the first consists of phytoplankton and benthic algal felts; and the second, the herbivores represented only by zooplankton. Only the first trophic level may be present in wallows. (Auen-Wisconsin)

ALGAL RESPONSE TO NUTRIENT INPUTS IN SOME IOWA LAKES,
J. R. Jones, and R. W. Bachmann.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 904-910, 1975. 2 fig., 3 tab., 18 ref.

Descriptors: *Estimating, *Algae, *Standing crops, *Phosphorus, *Iowa, *Eutrophication, Agricultural runoff, Rainfall, Analytical techniques, Lakes.
Identifiers: *Nutrient budgets, Lake West Okoboji(Iowa), Lake East Okoboji(Iowa), Big Spirit Lake(Iowa), Gar Lake(Iowa).

If algal populations are controlled by annual phosphorus inputs and if plankton algae are able to use all the phosphorus made available, then maximum algal crop should be related the the potential phosphorus concentration; consequently this maximum would represent the largest standing crop attained from a given phosphoru load. This assumption was investigated by determining annual phosphorus inputs from agricultural runoff and rainfall to four Iowa lakes(West Okoboji, East Okoboji, Big Spirit, and Gar). On the average, 0.35 kg/ha of total phosphorus annually was lost from the watersheds during the three-year study. Rainfall contributed approximately 0.032 gm/sq m of phosphorus annually. Potential phosphorus concentrations differ among lakes and are inversely proportional to their hydrologic turnover times. The mean July-August chlorophyll-a value, representing the peak bloom, was used to represent maximum biomass and then regressed on the respective potential phosphorus concentrations. The lake with the highest potential phosphorus concentration had the greates chlorophyll concentrations, and lakes with proportionally smaller phosphorus inputs had smaller algal crops; also, the algal populations were responsive to annual inputs. This approach provides a means of using nutrient budgets to estimate algal standing crops. The relationships between potential phosphorus concentrations and summer algal crops explains the differences among lakes as well as muchof the year-to-year differences within a single lake.(Auen-Wisconsin).

THE RELEASE OF DISSOLVED ORGANIC CARBON FROM SUBMERSED AQUATIC MACROPHYTES: DIEL, SEASONAL AND COMMUNITY RELATIONSHIPS,
R. A. Hough, and R. G. Wetzel.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 939-948, 1975. 9 fig., 4 tab., 15 ref. AEC AT-C11-1)-1599, C00-1599-82; NSF GB-15665, GB-81018X, GB-40311.

Descriptors: *Carbon cycle, *Aquatic plants, *Photosynthesis, *Respiration, *Michigan, Bulrushes, Kinetics, Lakes.
Identifiers: *Dissolved organic carbon, *Lawrence Lake(Mich), Najas flexilis, Scirpus subterminalis.

Release of dissolved organic carbon(DOC) as recent photosynthate has been demonstrated in aquatic vascular plants and has been estimated to comprise about 4% of total fixed carbon annually in a hardwater lake. This reduction of net photosynthesis is detrimental to plant production but the organic release may be beneficial to the community production. DOC release from Najas flexilis and Scirpus subterminalis in axenic cultures and in Lawrence Lake, Michigan, was measured simultaneously with release of carbon dioxide in a C14-assay for photorespiration. Najas released DOC somewhat more rapidly in darkness than in light, with a surge following sudden darkness. Organic release rates were largely independent of oxygen and carbon dioxide concentration. Release kinetics suggested that glycolate was not extensively excreted by Najas but rather was oxidized in photorespiration. Organic carbon release from Najas cultures was greater in presence of epiphytic diatoms whereas release in presence of organic carbon in situ was relatively low in Najas in summer but increased 4-fold in the fall during senescence. Release rates in early afternoon were over 2-fold those in the morning and late afternoon. Release of organic carbon by Scirpus was lowest in fall and highest in the spring. (Auen-Wisconsin).

Descriptors: *Eutrophication, *Phosphates, *Nitrates, *Biomass, Algae, Growth rates, Limiting factors, Turnovers, Asia, Lakes.
Identifiers: *Lake Kinneret(Israel).

The effects of added nutrients on the plankton biomass and the influence of environmental factors on the residence time of dissolved phosphate in Lake Kinneret, Israel, were investigated. Bottle

tests were made on the growth stimulatory effect of added nitrate, ammonium, phosphate, nitrate + phosphate, iron and silicate ions, and vitamin B12 on the total biomass. Turbidity, dry weight and chlorophyll content were used as biomass measurements. Addition of phosphate significantly increased both the growth rate and the biomass production, while addition of phosphate + nitrate caused an even larger increase in biomass. Growth stimulation induced by added phosphate was most noticeable during winter and spring, and was less pronounced during late summer. The other added nutrients did not affect growth. The residence times of dissolved phosphate were measured, using P32-orthophosphate as a tracer. Residence times varied between winter and summer(water temperatures 14.5-30C)from several hours to about 13 minutes. Turnover of phosphorus was inhibited to various extents by additions of 3-(3,4-dichlorophenyl)-1, 1-dimethylurea, m-chlorocarbonylcyanide phenylhydrazone, and arsenate but was completely blocked by the addition of formalin. (Auen-Wisconsin).

THE INFLUENCE OF SPRING CIRCULATION ON ZOOPLANKTON DYNAMICS IN THE PLUSSEE,
W. Hofmann.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1241-1250, 1975. 11 fig., 8 ref.

Descriptors: *Zooplankton, *Spring, *Mixing, *Stratification, Niches, Distribution, Foreign countries, Seasonal, Lakes.
Identifiers: *Lake Plussee(Germany).

The effect of incomplete spring circulation on the zooplankton community and individual populations were investigated in Lake Plussee, Germany. It had been noted that many zooplankton populations exhibited an exponential growth rate after the ice break-up, generally with large changes in abundance and distribution within a short period. In 1970 the ice break-up occurred on April 20th, mixing only the upper 10M of the water column; conversely, in 1972 the ice break-up occurred on March 20th and before stratification began there was a total mixing of the water column. While the ice break-up occurred one month later in 1970 than in 1972, the maximum zooplankton abundance was as high as in 1972 due to the very rapid growth of rotifers. In contrast to the increase, abundance decreased at nearly the same time in both years. Both cladocerans and copepods were much more abundant in 1970 than they were in 1972. The 1972 conditions were advantageous for Keratella guadrata, Kellicottia longispina, Asplanchna priodonta, Bosmina longirostris, Eudiaptomus gracilis and Mesocyclops luecharti, whereas in 1970 Asplanchna girodi and Synchaeto pectinata were more abundant. The niche overlap was high in 1970 due to crowding of all populations in the 10 m of the water column, and contained a low diversity index. (Auen-Wisconsin).

RESPONSE TO EUTROPHIC SHAGAWA LAKE, MINNESOTA, U.S.A., TO POINT-SOURCE, PHOSPHORUS REDUCTION,
D. P. Larsen, K. W. Malueg, D. W. Schults, and R. M. Brice.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 884-892, 1975. 6 fig., 1 tab., 14 ref.

Descriptors: *Nutrient removal, *Phosphorus, *Lakes, *Tertiary treatment, Sewage effluents, Cycling nutrients, *Minnesota.
Identifiers: *Lake restoration, *Shagawa Lake(Minn.), Point-source pollution.

Changes brought about by the construction of a tertiary sewage treatment plant at Ely, Minnesota, and a subsequent 70% reduction of phosphorus loading to nearby eutrophic Shagawa Lake, are discussed. The average annual load of wastewater phosphorus to the lake from 1967 to mid-1974 was 5380 kg. Waste phosphorus loas was reduced to about 25% during 1973, when the treatment plant first went into operation. During 1973 and 1974 the lake had entered a phosphorus washout phase, approximately 50% more phosphorus leaving the lake than entering. However, Shagawa Lake appears to have reached a state of internal loading, especially during July and August, that contributes a sufficient amount of phosphorus to produce large algae crops. Mass balance estimates demonstrated that the internal phosphorus load during July-August 1971-1973 was sufficient to increase the average phosphorus concentration in the lake 1-2 microgram/1/day. Most of this internal load was redeposited during the fall overturn and thus had little influence on the annual calculations of the phosphorus budget. During 1973,the internal phosphorus load increased from 30 microgram/1 to more than 80 microgram/1, thus the projected improvement of the lake in two years was unattainable.(Auen-Wisconsin).

MEROMIXIS IN ULMENER MAAR (GERMANY).
K. M. Stewart, and E. Hollan.
Verhandlungen Internationale Vereinigung Limnologie, Vol. 19, Part II, p. 1211-1219, 1975. 5 fig., 1 tab., 17 ref.

Descriptors: *Thermal stratification, *Lakes, Profiles, Foreign countries, Limnology, Water temperature.
Identifiers: *Meromixis, *Ulmener Maar(Germany).

Extensive changes noted in the temperature profiles of the Ulmener Maar, Germany, lead to investigations of whether this classic example of a spring-fed meromictic lake was undergoing changes in its stratification. Because of increased water usage from Ulmener Maar, the Jungfernweiher Reservoir was constructed on the north side of the lake between 1940-1945 by damming a small brook, which did not affect the lake. Water from the reservoir was directed through a tunnel to the lake to augment it's water supply. The intensive water use from the lake caused the water level to fluctuate more than 7 m over the years. The water was normally taken from drilled wells on the bank of the lake to provide 'bank filtered' water. About 1957, two wells were extended from approximately 5 m to 20 m below the mean water level to increase the water supply. Comparisons of oxygen and density values with historical records indicated that the water withdrawal, the water level fluctuations, and the inflow from the reservoir have apparently changed the strong meromictic condition of Ulmener Maar to one which is only marginally or irregularly meromicic, or to one with a very thin monimolimnion. OIL-OXIDIZING BACTERIA OF THE RIVER YENISEI, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Microbiology.
T. V. Koronelli, and V. E. Golimbet.
Biol Nauki (Mosc) 19(1), p 105-108, 1976.

Descriptors: *Aerobic bacteria, Isolation, *Lipids, Water pollution, Pollutant identification.
Identifiers: *Arthrobacter-Sp, Mycobacterium-Ceroformans, Mycobacterium-Paraffinicum, *Mycobacterium-Sp, Russian-SFSR, *River Yenisei(USSR), *Oil-oxidizing bacteria.

Different strains of Mycobacterium and Arthrobacter were isolated from the water of the Yenisei (Russian SFSR, USSR) and divided into 4 groups according to their cultural properties in hard medium with paraffin. The Mycobacterium and Arthrobacter strains differed in the qualitative composition of free lipids. The lipids of Mycobacterium sp. E-27 were similar to Mycobacterium paraffinicum, and the lipids of Arthrobacter sp. E-8 to Mycobacterium ceroformans.--Copyright 1977, Biological Abstracts, Inc.

MATHEMATICAL MODELS OF STRONTIUM-90 BEHAVIOR IN 'WATER-FRESH WATER FISH SPAWN' SYSTEM FOR PARTICULAR CASES OF RADIOACTIVE CONTAMINATION OF RESERVOIRS, (IN RUSSIAN),
Institute of Radiation Health, Leningrad (USSR).
S. Y. Sukal'skaya, I. A. Likhtarev, N. I. Mashneva, and A. A. Moiseec.
Zh Obshch Biol 37(3), p 459-470, 1976.

Descriptors: *Mathematical models, *Stronium radioisotopes, *Radioactivity, Reservoirs, Water pollution, *Spawning, Fish behavior.
Identifiers: *Strontium-90.

A 2-compartment model for 90Sr exchange in the water-fresh water fish spawn system is proposed. Systems of differential equations were examined which describe kinetics of 90Sr accumulation in and elimination from the fish spawn in some likely situations of aquatic radioactive contamination. Theoretical calculation results were compared to those of experimental studies of the time course of 89Sr accumulation and retention. The proposed model can be used for data interpretation and for designing further experiments.--Copyright 1977, Biological Abstracts, Inc.

MACROPHYTES AND PHOSPHORUS IN LAKE ANDSJON, CENTRAL SWEDEN, (IN SWEDISH),
L. Thofelt, and L. Olden.
Fauna Flora (Stockh) 71(1), p 29-34, 1976.

Descriptors: *Phosphorus, Lakes, Farm wastes, Birds, Aerial photography, Vegetation, Biomass, Water pollution control, Algal control, Aquatic weed control.
Identifiers: Bird sanctuary, *Carex-Rostrata, *Macrophytes, *Phragmites-Communis, Reeds, *Lake Andsjon(Sweden).

Lake Andsjon, a bird sanctuary and nature preserve in central Sweden, is a shallow lake surrounded by agricultural land and housing developments. Due to manuring of the fields the phosphorus content of the lake frequently exceeds 20 micrograms P/dm-3 and the lake is becoming overgrown with reeds, primarily Phragmites communis and Carex rostrata. Ten sample plots were taken in the northern part of the lake and all vegetation was removed for biomass determinations. The areal extent of the vegetation was determined by means of aerial photos and through the ice in late winter. Of the 34.2 ha surface of the lake 37.1% was covered with Phragmites and 4.4% with Carex. The dry weight of vegetation per m2 of sample plot was 5000 g for Carex. Phragmites ranged from 600 g for thin stands up to 4100 g for dense stands. The P content per gram of dry matter was 1.7 mg in Carex roots and 1.2 mg in tops with comparable values for Phragmites of 1.1 and 0.68 for thin stands and 0.67 and 0.54 for dense stands. By removing the vegetation the P content would be decreased by 80% and new vegetation would be able to absorb most of the P entering the lake in the future.--Copyright 1977, Biological Abstracts, Inc.

STUDIES ON FUNGAL PROPAGULES IN THE WESER ESTUARY (GERMAN BIGHT): I. QUANTITATIVE DATA 1974, (IN GERMAN),
Institut fuer Meeresforschung, Bremerhaven (West Germany).
K. Schaumann.
Veroeff Inst Meeresforsch Bremerhaven 16(1), p 63-82, 1976.

Descriptors: *Bacteria, *Estuaries, Data collections, *Aquatic fungi, Seasonal, Nitrogen, Oxygen, Yeasts, Water temperature, Biochemical oxygen demand, Turbidity.
Identifiers: *Fungal propagules, *Mycelia-forming fungi, *Weser Estuary(Germany), German Bight.

As part of the Weser Estuary Research Program, initiated for the control of hydrographic and biological conditions in this habitat; the number of higher fungal propagules in the waters of the Weser estuary at Bremerhaven was determined monthly during a 1 yr period from Jan.-Dec. 1974, using the pour-plate method. Mycelia-forming fungi (Hyphomycetes) and yeast-like fungi occurred in numbers up to 145,800 and 135,600, respectively, and revealed striking seasonal variations, with high numbers in winter and much lower number in summer. This pattern was evident in the surface waters as well as in the near-bottom waters. During winter the fungal numbers in the latter was nearly twice as high as the surface. Similar fluctuations were exhibited by several hydrographic factors, e.g., turbidity, organic N, biological O2 demand, freshwater inflow, water temperature and number of heterotrophic bacteria. Whether the correlation between these factors and fungi is causal or parallel cannot be decided. The origin and activity of the fungal propagules in the ecosystem of the Weser estuary are discussed.--Copyright 1977, Biological Abstracts, Inc.

DATA 1973/1974 REGARDING HYDROGRAPHY AND WATER QUALITY IN THE WESER ESTUARY, GERMANY, (IN GERMAN),
Institut fuer Meeresforschung, Bremerhaven (West Germany).
S. Wellershaus.
Veroeff Inst Meeresforsch Bremerhaven 16(1), p 45-62, 1976.

Descriptors: *Bacteria, *E coli, Water quality, *Estuaries, Data collections, Salinity, Water temperature, Dissolved oxygen, Nitrogen, *Aquatic fungi, Water pollution.
Identifiers: *Weser Estuary(Germany).

At 6 positions between Esenshamm and Robbenplate monthly measurements were done of salinity, temperature, dissolved O2, 5-day biochemical O2 demand (BOD5), Kjeldahl-N, turbidity (light-attenuation), settling volume and pH. At 1 station, counts of bacteria including Escherichia coli, of higher fungi and of chytrid fungi were added. According to the water quality evaluation suggested by Liebmann (1969) and Hamm (1969) the Weser Estuary can be classified into class II-III, III, and III-IV, sometimes locally reaching class IV. Water quality is poorest within the turbidity cloud which develops near Bremerhaven and Nordenham, and a few Kilometers seaward of Bremen.--Copyright 1977, Biological Abstracts, Inc.

SELF-PURIFICATION IN THE COASTAL WATERS OF THE BLACK SEA, (IN RUSSIAN),
O. G. Mironov, L. N. Kiryukhina, M. I. Kucherenko, and E. P. Tarkhova.
Naukova dumka: Kiev, USSR, (1975), 143 p.

Descriptors: *Self purification, Bottom sediments, Water purification, *Oil pollution, *Bacteria, Marine life, Pseudomonas.
Identifiers: Bacillus, Chromobacterium, Microbacterium, Micrococcus, Mycobacterium, Pseudobacterium, USSR, Vibrio, *Petroleum oxidizing bacteria, *Black Sea.

The self-purification of the waters and bottom sediments of the coastal zone of the Soviet shores of the Black Sea (USSR) from petroleum is discussed. Data on the numbers, species composition, distribution and biochemical characteristics of petroleum-oxidizing bacteria are presented, and the physicochemical properties and processes of the transformation of organic substances from the marine bottom sediments are analyzed. Petroleum-oxidizing bacteria of the genera Pseudomonas, Pseudobacterium, Chrombacterium, Micrococcus, Microbacterium, Mycobacterium, Bacterium, Bacillus and Vibrio were isolated in the studied area. The capacity of this marine area for self-purification is evaluated. The monograph is intended for oceanographers, hydrobiologists, ichthyologists and those employed in fisheries, the marine fleet, hydrometeorological service and environmental protection.--Copyright 1977, Biological Abstracts, Inc.

Identifiers: *Amylolysis activity, Bothriocephalus-gowkongensis, *Cestodes, Desorption, Glycogen, Triaenophorus-nodulosus, *Organochlorine chemicals.

The distribution of residues of DDT and its metabolites (DDD and DDE) in tissues of Triaenophorus nodulosus and its host (pike) was studied. Cestodes can accumulate large amounts of organochlorine substances. The ability of Bothriocephalus gowkongensis (cestode of carp) to dechlorinate p, p-DDT and to excrete p,p-; o,p- and m,p-DDD from the organism was established. p,p-DDT decreased the glycogen content and caused increased amylolytic activity in the cestodes in acute tests. The effect of p,p-DDT on locomotor activity in the cestodes has 2 phases, the first associated with the muscular influence and the second with a neurotrophic effect. m,p-DDD (0.1 mg/1) was highly toxic to the locomotor activity of cestodes, as compared with the effect of p,p-and o,p-DDD.--Copyright 1977, Biological Abstracts, Inc.

STUDY OF BACTERIA ASSOCIATED WITH THE REARING OF LARVAE OF MARINE BIVALVES, (IN FRENCH),
Universite de Bretagne-Occidentale, Brest (France). Laboratoire de Zoologie.
D. Prieur.
Aquaculture 8(3), p. 225-240, 1976.

Descriptors: *Bacteria, *Algae, Larvae, *Nutrient requirements, Marine animals, Water pollution.
Identifiers: Antibiotics, *Bivalves(Marine), Mytilus-edulis.

Bacterial strains (81) associated with the rearing of marine bivalve larvae were isolated from different origins: unicellular algal cultures, filtered sea water, unhealthy larvae, Mytilus edulis spawn, and contaminating strains from the laboratory atmosphere. The ecological, bio-chemical and nutritional characteristics and the sensitivity to antibiotics of these strains were studied with the aid of 115 tests. This population appears to be similar to comparable populations studied by others. Complementary studies taking into account the quantitative and qualitative variations of each source of bacterial contamination are necessary and are now in progress. When these are complete, more efficient bacterial control of the breeding of marine bivalve larvae will be possible.--Copyright 1977, Biological Abstracts, Inc.

THE DEVELOPMENT OF REGIONAL INDUSTRIAL WASTE PROCESSING CENTRES,
Re-Chem International Ltd., Southhampton (England).
A. K. Coleman.
Water Pollution Control, Vol. 76, No. 1, p 67-74, 1977. 1 fig.

Descriptors: *Chemical wastes, *Treatment facilities, Industrial wastes, Pollution abatement, Chemical treatment, Waste disposal, Inorganic compounds, Organic matter, Filtration, Incineration, Laboratory tests, Sludge treatment, Waste water treatment, Dewatering, Design criteria, Legislation.

Legislation and increasing public concern have created a need for regional industrial waste treatment facilities in England. Alternatives to land disposal and discharge to receiving streams, such as chemical treatment, incineration, polymerization, recovery, and recycling are receiving much investigation. Design criteria for these regional centers should consider all possible safeguards against any type of environmental pollution that might result from the disposal scheme chosen. The Re-Chem International Regional Waste Treatment Center was discussed in detail. A major feature of this facility is strict laboratory control at all stages of each process. Inorganic wastes are treated by wet chemical processes to convert them into water soluble or insoluble derivatives which can be removed from the water. Recovery products are later dispatched to a purchaser. Non-recoverable materials are subjected to effluent filtration, gravity sludge thickening, dewatering by pressure filtration, and land disposal, pending laboratory analysis. Water produced by the process is analyzed for toxicity and treated by a 'polishing' chemical process for decontamination. Solids are passed to the filter cake disposal bins. Final effluent is subject to laboratory certification. Organic wastes are incinerated by a process having various automatic controls and safeguards to ensure proper operation. Odor from the treatment processes are controlled by air extraction systems and high incineration temperatures. The process is most applicable to wastes from the chemical industry. (Collins-FIRL)

PHENOL-SELECTIVE, HIGHLY RESISTANT RO-MEMBRANES MADE FROM PVA FOR THE PURIFICATION OF TOXIC INDUSTRIAL WASTES,
Erlangen-Nuremberg Univ. (West Germany). Institut fuer Technische Chemisches.
S. Peter, N. Hese, and R. Stefan.
Desalination, Vol. 19, p 161-167, 1976. 7 fig, 1 tab, 11 ref.

Descriptors: *Phenols, *Reverse osmosis, *Chemical wastes, *Membrane processes, Ion exchange, Separation techniques, Water purification, Chemical industry, Industrial wastes, *Waste water treatment.
Identifiers: *Polyvinylalcohol membranes.

Phenols have been amongst the most difficult chemical wastes to remove in water purification processes. Experiments using membranes of polyvinylalcohol (PVA) were conducted to determine their usefulness in removing phenols by reverse osmosis. Two types of membranes were used. One of them was formed by complexing PVA in an aqueous or organic solution with boric acid, precipitating by acetone and air-drying, solving in a solvent or solvent mixture, and drawing to size on a steel plate. The other was made by drawing a film of defined thickness on steel plates from a concentrated solution of PVA in water. This was also precipitated in acetone; both were crosslinked by immersion in a polyvalent metal ion solution. The membranes are insoluble in water, acids, bases, and the usual organic solvents. They are resistant to phenol up to 5 weight % and show a pronounced phenol selectivity. Retentions up to 90-95% were produced. (Collins-FIRL)

LARGE-SCALE REVERSE OSMOSIS PROCESSING OF METAL FINISHING RINSE WATERS,
Universal Oil Products Co., San Diego, Calif. Fluid Systems Div.
S. S. Kremen, C. Hayes, and M. Dubos.
Desalination, Vol. 20, p 71-80, 1977. 1 fig, 2 tab.

Descriptors: *Water reuse, *Reverse osmosis, *Heavy metals, Industrial wastes, Copper, Zinc, Salts, Chromium, Acids, Flocculation, Filtration, Polyelectrolytes, Filters, Waste treatment, Performance, Design, *Waste water treatment.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Identifiers: *Metal finishing wastes.

Desalination is only one tool for augmenting potable water supplies. Another way to achieve this goal is to increase reusable water sources by purification. A reverse osmosis process and system were developed to purify a dilute waste stream from a metal finishing plant. The wastes contain copper, zinc, salts, acid, and chromium compounds. The chromium present in the waste water was precipitated for use a a flocculating aid by increasing the pH of the solution to 5.5; additional polyelectrolyte flocculant was added prior to filtration. After this treatment, the filtrate from the granular media filters generally had a turbidity of less than 0.2 turbidity units. The solution was acidified to prevent precipitation of the remaining metal salts during reverse osmosis. The waste was first concentrated by a factor of about 5, then the pH was raised again for further concentration to a 95% water recovery. Finally, the solution was acidified, chromate was reduced with sulfur dioxide, and caustic soda was added to precipitate the hydrous oxides of copper, zinc, and trivalent chromium. The resulting sludge, about 400 gallons per day, was landfilled. The plant performance, after shake-down, is in good agreement with design predictions. (Collins-FIRL)
W77-07207

CALCIUM CARBONATE IN THE REVOMAL OF IRON AND LEAD FROM DILUTE WASTE WATER,
Western Regional Research Lab., Berkeley, Calif.
E. Hautala, J. Randall, A. Goodban, and A. Waiss, Jr.
Water Research, Vol. 11, No. 2, p 243-245, 1977. 3 fig, 1 tab, 7 ref.

Descriptors: *Iron, *Lead, *Calcium carbonate, *Metals, *Waste water treatment, Water purification, Industrial wastes, Water reuse, Water quality control, Chemical wastes.
Identifiers: *Chemical treatment.

A treatment was investigated for acidic waste water containing iron and lead resulting from the production of lead storage batteries. The presence of these metals prevents recycling of the water for production and prohibits disposal to sewer systems. Acid mine waters and steel pickle liquor resemble this effluent in acidity and sulfate and soluble iron content. They have been treated by calcium carbonate. This treatment was attempted with storage battery waste waters. Simple settling with CaC03 did not remove enough iron to meet the water quality standards required for reusing the water. Some form of filtration using CaC03 was recommended. Powdered CaC03 added to a slurry concentration of neutralized waste water, which was then filtered, produced an effluent with less than 0.2 ppm of iron and a lead concentration of less than 0.3 ppm. Lead concentrations depended upon proper pH control. Further filtration through a bed of redwood bark produced an effluent suitable for recycling or disposal to a sanitary sewer system. WASTE WATER RECLAMATION SYSTEM UPS PRODUCTIVITY, CUTS WATER USE,
Beckman Instruments, Inc., Porterville, Calif.
J. E. Warnke, K. G. Thomas, and S. C. Creason.
Chemical Engineering, Vol. 84, No. 7, p 75-77, March, 1977. 1 fig, 1 tab.

Descriptors: *Water consumption(Except consumptive use), *Reverse osmosis, *Evaporation, *Water reuse, *Water purification, *Heavy metals, Industrial water, Industrial wastes, Waste disposal, Water quality control, Sludge treatment, Filtration, *Waste water treatment.
Identifiers: Solar evaporation ponds.

A waste water reclamation system, featuring reverse osmosis and a solar evaporation pond for metal wastes disposal, was installed at a California electronics plant. Objectives of the program were to reduce water use, improve reclaimed water quality, and reduce waste discharges which interfered with production. Sensors were installed on the plating line to monitor the conductivity of reclaimed water in the rinse tanks and to make necessary corrections. This reduced comsumption from 1.5 million to 750,000 gallons/month. Plating shop waste water was split into two streams. One, consisting of previously reclaimed rinse water containing tin, lead, palladium salts, pumice, silicates, or methylene-chloride and contaminated city water, flowed to the solar evaporation pond. Reclamation was not attempted. The other stream was pretreated and processed by the reverse osmosis unit. Nearly 90% of the contaminated concentrate from reverse osmosis was returned to pretreatment for recycling. The remainder was sent to the pond. Pretreatment consisted of filtration, pH adjustment, and algae growth prevention. The reverse osmosis unit was capable of processing 25 gallons/minute of waste at a design efficiency of 90%. A granular carbon filter unit was used as a final polish for reverse osmosis permeate, even though about 90% of the heavy metals were removed by the membranes. The solar pond was designed to accommodate a waste discharge of 6,000 gallons/day. It was estimated that sludge removal would not be necessary for fifty years. When sludge is to be removed, it will be processed for metals recovery. Costs of the system were offset by water reduction, increased product quality, and the replacement of other treatment systems. ELECTROLYTIC TREATMENT OF CHROMATE AND CYANIDE WASTES WITH PACKED BIPOLAR CELL, (IN JAPANESE),
Kyoto Univ. (Japan). Dept. of Industrial Chemistry.
S. Yoshizawa, Y. Miyazaki, and A. Katagiri.
Nippon Kagaku Kaishi, No. 1, p 19-24, 1977. 8 fig, 3 tab.

Descriptors: *Electrolysis, *Aqueous solutions, *Liquid wastes, Chemical reactions, Chemical properties, Physical properties, Oxidation, Waste treatment, *Waste water treatment, Evaluation, Activated carbon, Particle size.
Identifiers: *Cyanide wastes, Chromate wastes, Power efficiency, Reaction rates.

A packed bipolar cell was used for the electrolysis of liquid wastes containing cyanide and chromate. Characteristics of the system were evaluated by testing K2Cr04 and KCN solutions under various conditions of particle material, particle size, and applied voltage. Chromate ion was reduced to Cr(OH)3 that deposited on packed particles and cyanide ion was oxidized to CN0(-) or C02 and N2. When the cell was packed with activated carbon particles, power efficiency and the reaction rate were higher than in conventional cells. Increased applied voltage reduced power efficiency and increased the reaction rate. The solution concentration probably determined optimum particle size and applied voltage. (Collins-FIRL)

ULTRAFILTRATION OIL RECLAMATION PROCESS,
Chester Engineers, Inc., Coraopolis, Pa.
A. F. Lisanti, and R. Helwick
Iron and Steel Engineer, Vol. 54, No. 3, p 60, March, 1977. 1 fig.

Descriptors: *Oil wastes, *Filtration, *Membrane processes, *Waste water treatment, Performance, Temperature, Sedimentation, Separation techniques, Industrial wastes, Heat treatment, Automatic controls, Water reuse.
Identifiers: *Ultrafiltration, Steel production.

An ultrafiltration process, using recovered oil as fuel and discharging separated water into a municipal sanitary sewer system was used to treat waste oil at three Pittsburgh, Pennsylvania, steel plants. No chemicals were added, no inorganic sludge was produced, and the effluent was free of floating oil. About 90% of the wastes was, by volume, and oil-in-water emulsion; 10% was tramp oil. The tramp oil was water insoluble and easily removed by quiescent settling and skimming. Water soluble oil emulsions were pumped through tubular membranes which retained oil droplets and suspended particles. Water and dissolved low molecular weight materials were passed through the membranes. The ultrafiltration membranes did not clog with contaminants. Backflushing removed any surface fouling. Productivity decreased as the feed concentration was increased. The temperature used should be the highest possible without creating short-term failure or long-term degradation. Normal operating temperatures were between 90 and 100 F. Safe operating pressures were found to be between 20 and 60 psig. The system also comprises a temperature indicator controller, pressure gauge switch assemblies, a flow meter, and an automatic purge system. Concentrated oily emulsions can be pumped to an available cooker where there is further oil and water separation. Sulfuric acid is added to facilitate this separation process and recovered oil is fed to a storage tank while the water is recycled to the ultrafiltration feed tank for retreatment. The system is reliable and flexible. (Collins-FIRL)

TECHNIQUES FOR PURIFYING OILY WASTE WATER,
Betz Labs., Inc., Trevose, Pa.
L. C. Hale, and D. Bauer.
Plant Engineering, p 131-133, March 17, 1977. 5 fig.

Descriptors: *Oil wastes, *Chemical treatment, *Polymers, Chemical degradation, *Waste water treatment, Water purification, Pollution abatement, Environmental control, Coagulation, Sedimentation, Flocculation, Industrial wastes.

Stricter environmental pollution regulations have forced industries to remove oily wastes from their effluents before discharging them into receiving streams or sewer systems. The removal of oil contaminants present many problems, but increased oil costs have given impetus to the search for suitable recovery methods. These alternatives were reviewed. Waste water from hot-strip-rolling mills, cold-rolling mills, and automotive and metal-forming plants is usually an oil-in-water emulsion. Polymers and emulsion breakers neutralize the repulsive charges between particles, precipitate or salt out emulsifying agents, or alter the interfacial film. Emulsion breakers for these wastes should be oil soluble and surface active. An acid and aluminum sulfate have been traditionally used; a newer method for coagulating and breaking emulsions is to use liquid cationic polymers. Separation by heat treatment can also be used for water-in-oil emulsions containing solids. Coagulation, flocculation, and sedimentation are used in combination to treat steel mill wastes. Refinery wastes are usually treated in gravity-type separators and then further treated in induced-air flotation units. Either batch or continuous processes can be used to remove oily contaminants. The former handles variations in waste composition better because the batches can be analyzed for specific final treatment. Continuous processes call for automatic controls to intensively monitor changes in waste composition. (Collins-FIRL)
